NO. 1.

ITALIAN OLD MASTERS.

MICHELANGELO BUONAROTTI. (1474-1564.)

HE saddest of all the artist-lives we know of is that of Michelangelo. Egregious self-esteem is often the accompaniment of the artistic temperament, and is diligently fostered by the indiscriminating admiration of the incompetent and ignorant modern public, becomes the compensation for many failures and the salve for many wounds; if it existed in him in a notable degree, it was accompanied by so just an appreciation of his own capacities that it could have given him little satisfaction in presence of the far greater popularity of Raphael, and (what was still more depressing to his self-respect) the utter miscomprehension of the character of his genius by those who alone could give him employment fitting to it. His contempt for Raphael—probably in the main the result of the excessive admiration of that precocious genius by the whole world of Rome—was founded at least on the extreme incongruity of his own and Raphael's art,—the former masculine, sublime both in its intensity and in its forms, the latter feminine, flexible, full of the graces which demoralize art, and made attractive by a seductive sweetness which to the robust imagination of Michelangelo must have been the very Capua of its decline. In the full sense of this, to him, degradation of art, he was goaded to revolt by commissions that had no relation to his genius, and work that only his universality made endurable, while his profoundly religious nature compelled obedience to the head of the church,

and must have driven him to despair as it drove him to what he knew for injustice to his true calling. This, with intervals of congenial employment, was the tenor of his life.

The light of the most exhaustive research has been thrown on his life, and romance has charged it with its highest colors, though the simple truth is at once romantic and pathetic enough. He was born in Settignano,¹ in the Val d'Arno, at the time that the greatest painters of the best epoch of Italian art were in full activity,—just as the last of the great Giotteschi, Paolo Uccello, died, and while Mantegna, Verrocchio, Signorelli, Botticelli, and Ghirlandaio were doing their best work. He had what was rare amongst the painters of that time—a family name, being descended from the ancient lords of Canossa, which, in a time when the prestige of blood was strong, may have accounted in part for the supercilious spirit with which he certainly did look on some of his brother artists; and but for his love of art and the strong devotional tendencies of his character, he would probably have taken a leading part in the public affairs of his country. The artist was not, till after the day of Raphael and Titian, the object of any deference in the social world, though to a partial extent he had been the object of a certain religious reverence, which was passing away when Michelangelo appeared on the scene. The painter, as well as the architect, was simply an artisan of a superior class, and the sculptor only a superior decorator. They were all set to work accord-

¹ Another account says at Caprese. I do not find that there is any definite statement of the place of birth. His father, Lodovico di Lionardo Buonarroti Simoni, lived in Settignano, near Florence, but was for the year of Michelangelo's birth Podestà of Chiusi

and Caprese, and returned to his estate at Settignano when the year was ended; but whether the family accompanied him in his official migration is not clear. Under the circumstances he must be considered a native of Settignano.

ing to the tastes and conveniences of their employers and paid mostly by the month; and in the judgments of the time the qualities which gave the precedence in popular approbation were those of good workmanship and intelligible story-telling. A correct judgment of the higher excellences of sculpture is always far above the capacities of any general public, and was certainly as much so at the time of Buonarroti as it is now. He was by the public never judged by his highest gift, which was that of sculpture. At the age of fourteen he was placed as an apprentice in the studio of Ghirlandaio, when already, by the aid of his comrades, he had made some progress in the art, as is shown by the articles of apprenticeship, according him pay in the first years of his apprenticeship, six, eight, and twelve florins of gold respectively; but his early instruction was not such as to modify the peculiar tendency of his genius, for Ghirlandaio was no colorist, but a painter of great academical attainments and abilities, whose instructions were perhaps more profitable to the peculiar nature of Michelangelo than would have been those of a better painter having less scientific tendencies.

Being received two years later into the Academy of Lorenzo de' Medici, he found his true occupation through the study of the antique marbles collected there. Probably no artist of our era was so completely capable of appreciating the art of Greece both in its form and in its spirit, and to my mind no loss to the world's art has been so great as that which diverted Michelangelo from sculpture. This we owe to the Popes. Lorenzo de' Medici was apparently a better judge of the artist, for he so highly appreciated his attempt to rival the Greeks that he made him an official pensioner of the state. The first expulsion of the Medici, however, left him at the age of twenty dependent on his own resources. Whether from grief at the downfall of his protector (for, though deficient in the taste of Lorenzo, his successor, Peter II. had become the patron of Michelangelo) or from the want of occupation in Florence, he went to Bologna and found work in sculpture. It is said that a Cupid of his execution done at this time was purchased by the Duchess of Mantua as an antique, which fact did more for his reputation than the merit of his work would have done, and led to his being invited to Rome, where at this visit he was occupied only in sculpture. The great Pietà in St. Peter's (placed where it is quite impossible to see it properly) was a work of this epoch, executed at the age of twenty-five, and to my mind is the most perfect of all his works. He was then recalled to Florence to execute certain commissions for the city, among them the lost cartoon in rivalry with Leonardo, of

which one can only say that it showed his knowledge of anatomy if we may judge by the copy of a portion of it which remains, but on which, as a whole, we can pass no judgment. In 1506 he was again called to Rome by Julius II., to design the monument to himself, of which we have the Moses in S. Pietro in Vincoli, in Rome, and several other statues left unfinished, for the monument was never completed.

Michelangelo's ill-fortune in his fame has followed him to the present day, for instead of being judged peculiarly as a sculptor, he is still most admired for the "Last Judgment" of the Sistine Chapel, painted at a later period than this, and perhaps the most ungrateful of the tasks imposed on him by papal order. Had it been painted in that period of greater elasticity of talent in which the ceiling was painted it would no doubt have been more in keeping with it, but in the interval the artist had grown older, had devoted himself more to the study of anatomy, which is in the highest degree obnoxious to the spirit of beauty, and, like all scientific pursuits, to the subtlety of art, and had devoted himself for the intervening years purely to sculpture. He must have had little sympathy with the task, for though it brims over with ostentation of power and scientific knowledge, both elements hostile to the serenity of the highest art, it is as unhappy in its impression as if the artist had imagined himself condemned in it. As a display of technical ability it is astounding; but I never look at it without an aversion which has as much of regret at the lost labor given to it as of the repugnance to the theme which I am convinced Michelangelo himself felt.

The ceiling of the Sistine Chapel, another commission of Julius, finished in 1512, is certainly the work which best justifies the employment of Michelangelo as a painter, not only as containing his best painting, but as in itself the finest piece of decorative painting in existence. It is in the taste of the time, in which the Renaissance had developed all the exaggerations of its characteristics, but both in the ensemble and in the invention of its details and the pathetic character of its mythic personages it has no peer amongst the many similar works of a time of fertile designing and masterly execution. He was able to give full play in it to his magnificent conception of the sculptural material of Roman mythology and to that subtle quality of composition which is so prominent in his statues, and is one of the artistic charms of Greek art,—that of filling a space without either monotony or dissidence of lines or masses. Every figure has the value of one on a Greek coin, and the largeness of treatment is a model for all time. For color we do not look to it, for he had not the gift of color in the high artistic sense, but even in this its

decorative value is satisfactory because, thanks to the scale of color employed, nothing jars; but for all other elements of art it is a lesson forever. Looking at the mighty sweep of his brush, we can well imagine the impatience with which he swept aside the little fresco-painters who were to do the work after his drawings, and shutting himself in a seclusion in which he had no need to apprehend stupid comment or — the worst that could befall him — imbecile approbation, gave permanent form to his inspirations.

The appreciation of works of such power and imagination must always be partial and limited, but to me the Scripture stories told in the central compartments are of less value as art than the Sibyls, which are sculpturesque creations more in the vein of all the marble work of Michelangelo, and in the direction of his highest gifts, which were in the invention of form. The Sistine ceiling was finished when he was still in what may be considered his youth, before he was thirty. In 1513 Julius died and was succeeded by Leo X., who was the friend of Raphael and was comparatively indifferent to Buonarrotti, and the ten years of this pontificate are the least productive and probably the least grateful of the artist's life. It is noted for the ungratified desire to erect at his own expense what would have been, in one sense, if it had been made an actuality, the most interesting monument of the Renaissance, a tomb to Dante, for the removal of whose remains to Florence the Signoria were then in treaty with the authorities of Ravenna, where the poet was buried. Whether the failure came from the Pope's refusal or the refusal of Ravenna to give up the remains of Dante we are not informed, but the world must regret the result of the negotiations. The accession of Clement VII. in 1523 brought Michelangelo again into activity, and the plans for the Medici Chapel at S. Lorenzo employed his best gifts. The statue of the Duke Lorenzo stands with the David and the Pietà in St. Peter's, at his highest level, and the Moses, in another vein, falls short of these three by but little. That which more than any of the other works of Michelangelo distinguishes him from the Greek on one side and the lesser men on the other, is the Lorenzo, since the imaginative element, which was his almost unique gift among sculptors, is stronger in it than in any other of his statues. If, as the tradition goes, he could call on his Moses to speak, he might have called on Lorenzo to rise and come down from his pedestal, so instinct with life is it. During the time that the artist was engaged on this work, the Medici were again expelled from Florence and the city was besieged by the forces of the Pope and

his allies to restore them. Michelangelo was called into service to fortify the city, and this episode of his life is one of the most interesting to his biography, if not to his art. He fled before the surrender, fearing the vengeance of the victors, and knowing well that in the temper of those times his character of artist was no protection in the rage of a sack of the city. He was recalled by the Pope to finish the chapel in S. Lorenzo.

The pontificate of Clement VII. was followed in 1534 by that of Paul III., who commissioned Michelangelo to paint the "Last Judgment," which he did, we are told, with reluctance, and probably, as I have already indicated, without interest; and it seems to me that this is betrayed in the work itself, though repainting has long since deprived it of that autographic quality which, like handwriting, betrays the mind of the man. It has suffered from restoration too much to enable us to pronounce on the painting, but the drawing remains as Michelangelo's, and it is almost all that is his, for the subject was forced on him. He was sixty-seven when it was finished. The almost defaced frescos of the Pauline Chapel were due to the same period, and closed his career as a painter. From this time to the end of his life he was principally engaged on St. Peter's, and this portion of his life is to my mind only less wasted than that employed on the "Last Judgment" and the Pauline Chapel. If even the original plan had been carried out and we had been fully enabled to judge of Michelangelo as an architect, it would not have been worth the time taken from sculpture, which was his peculiar art; but, looking at the church as it is completed, we cannot even find his design, and the stupendous dome alone remains to show his brain. As at St. Peter's is one of the worst failures of the late Renaissance, and not only in its general plan but in its details, except the dome, is far inferior to many of the minor churches of Italy. Michelangelo was fifty-eight when he was ordered to begin the "Last Judgment" and eighty-eight when he died.

The pathetic episode of the artist's life, which was his devotion to Vittoria Colonna, is in keeping with his whole life; throughout he was balked, disappointed, turned back into himself perpetually. That he never became a misanthrope or sullied his life with the immoralities too common in his surrounding adds to the luster of his character, not to his greatness as an artist; but we should regard a life as incomplete in which no such romantic interest entered, and that of Michelangelo has all the pathos of a great tragedy.

SOUTHERN WOMANHOOD AS AFFECTED BY THE WAR.

AMONG the many changes that have taken place in the Southern States and among Southern people within the past thirty years, some of which are the direct result of war, and others the simple and natural development of the times, there is none more significant and worthy of notice than the change that has taken place in the condition, the life, and the labor of Southern women. We refer, of course, to the white women of the South. The effects of the great revolution upon the negro race, upon the white man of the South, and upon the material and industrial development of the former slave-holding States, have all been fully and variously discussed. It is the object of this paper to discuss the effects of the war, and the changes resulting therefrom, upon the social, domestic, and intellectual life of Southern women.

It is now a quarter of a century since the close of the civil war—a period sufficiently long to show some of the important effects upon Southern society of the great revolution through which it has passed. It is an error to think that the colored race alone has been affected by the war. The condition, life, and labor of the white people of the South have been quite as seriously affected. It would doubtless be difficult to find an intelligent Southern white man who does not believe that the emancipation of the colored slaves has had a most salutary effect upon the Anglo-Saxon race.

But we wish to inquire especially as to how the great changes of the past thirty years have affected Southern womanhood. Have they proved a misfortune or a blessing to the gentler sex? Certain it is that the life and work of woman in the South are in many important respects very different now from what they were before the war. The young woman of to-day grows up under conditions and with environments vastly different from those which surrounded her mother and grandmother in their early days. We wish to compare and contrast the life, and condition, and work of woman as they are now in the South with what they were in ante-bellum times. Surely there have been great changes in the education and the work of women everywhere, at least throughout the English-speaking world, during the past thirty

years, and many of these would have reached and materially affected the life of Southern women had there been no civil war and no emancipation of slaves. It would be illogical, therefore, to assert that the cause or the explanation of every change that contrasts the life of Southern women now with what it was formerly is in the peculiar events that have taken place in our late history.

We might conveniently divide our subject into these three heads: (1) the Southern woman before the war; (2) the Southern woman during the war; (3) the Southern woman since the war. Were this our mode of presenting the subject, it would be to give three pictures of the same woman, and not of three different women. The virtues that adorn and ennoble the Southern woman of to-day find their explanation and origin largely in that womanhood which for the last fifty years and more has been the product and the pride of the Southern people. No matter what may be one's sympathy with or prejudice against the institution of slavery, there is no denying the fact that American civilization has nowhere produced a purer and loftier type of refined and cultured womanhood than existed in the South before the war. Nowhere else in America have hospitality and social intercourse among the better classes been so cultivated or have constituted so large a part of life as in what is called the old South. These large and constant social demands upon Southern women, growing out of the hospitable customs of the old plantation life, made the existing conditions very favorable for developing women of rare social gifts and accomplishments. In native womanly modesty, in neatness, grace, and beauty of person, in ease and freedom without boldness of manner, in refined and cultivated minds, in gifts and qualities that shone brilliantly in the social circle, in spotless purity of thought and character, in laudable pride of family and devotion to home, kindred, and loved ones—these were the qualities for which Southern women were noted and in which they excelled. That the Southern woman of ante-bellum times lacked those stronger qualities of character and mind that are born only of trials and hardships and poverty and adversity may be granted. That she contributed less in labor, especially manual labor, to the support and economy of the household than women in like financial condition

elsewhere may also be granted. But this was not because she was unable or unwilling to work, but simply because it was unnecessary. Before the Southern woman had passed through the four years' fiery ordeal of war, the virtues of character, of head and heart, that are born of adversity were all richly hers.

But the Southern woman's most trying period came only after the war, terminating as it did in the loss of nearly all property, in the entire breaking up of the old home life, and in the emancipation of the slaves, who had always relieved white women of the more unpleasant duties that would otherwise have long fallen to their lot in the economy of domestic life. Thousands upon thousands of delicate and cultivated women who had never done any of the harder and more disagreeable duties of domestic and home life, universally performed by the slaves, were now compelled to enter upon a life of drudgery and hardship for which nothing in their previous training had prepared them. If in prosperity, wealth, and luxury woman is weaker and frailer than man, when adversity comes she is stronger than man, stronger in heart and purpose, stronger to adapt herself to unfortunate circumstances and to make the best of them. Indeed, it is not until adversity comes that we know how strong a creature woman is. Many a trouble that utterly crushes strong man transforms weak woman into a tower of strength. Never did woman have a better opportunity to show this strength than at the close of the war, and right nobly did she meet the emergency and set herself to her work, encouraging and inspiring with hope Southern men, too many of whom had lost heart with their lost cause. It was the heart, the hope, the faith of Southern womanhood that set Southern men to working when the war was over, and in this work they led the way, filling the stronger sex with utter amazement at the readiness and power with which they began to perform duties to which they had never been used before. The wonderful recuperative energies of the Southern people since the war, as manifested in the present wide-spread prosperity of the Southern States, is recognized and admired by all; but who can tell how largely this is due to Southern womanhood? Was it not the brave-hearted wife that inspired the despairing husband when the war had ended to go to work and redeem his lost fortune, happy enough herself that she had a living husband to work with her, since so many of her sisters had to fight the battle with labor and poverty alone, while their husbands slept in the soldier's grave? Was it not the ambitious and hopeful sister that inspired her soldier brother, the unconquered and unconquerable maiden that inspired her disheartened lover, when the war was over? And

was not this womanly inspiration the most potent factor that entered the problem of the white man's immediate future in the South? Nor has woman's part in the up-building of the South been one of inspiration simply. It is the work which her own head and hands have accomplished that we wish to speak of more particularly in this paper; not her influence upon other things, but the influence upon her of the changes of the last thirty years. How then has Southern womanhood been affected by these great changes?

Some time since, in order to arrive at as true an answer as possible to this question, and in order to find out what Southern women themselves thought upon it, the writer selected from the range of his acquaintances in three different States some half-dozen representative Southern women, and addressed to them the following

QUESTIONS.

1. At the end of a quarter of a century since the close of the war—a period sufficiently long to furnish some true basis for a comparison and a judgment—is it your opinion that the emancipation of the slaves and the numerous other results of war affecting the Southern people have proved a blessing or a misfortune to the womanhood of the South? Has woman's lot, her life and labor, been affected favorably or unfavorably by the changed conditions?

2. What effect have these changes had upon woman's education in the South? Wherein does the education of young women differ now from what it was before the war? Is it more thorough and extensive now than then? Do a larger number of young women in proportion to population seek and obtain the benefits of seminary and college training now than then? and if so, how does this apply to the various grades of society—the rich, the middle, and the poorer classes? Is a larger number of young women acquiring an education now than then with a view to using their education for self-support? and if so, does this have a tendency to make them any more earnest and thorough in the prosecution of their studies than when few, if any, ever expected to make any practical use of their education? The relative importance attached to "the useful" and the merely "ornamental" in female education then as compared with the present. The so-called "higher education of woman" then and now. The tendency to develop literary women then as compared with the present.

3. What change, if any, has taken place in woman's attitude toward work and self-support, and in public sentiment with reference to this question, throughout the South? Have the effects of this change been good or evil to Southern women, or wherein good and wherein evil? What of the respectability of self-support then and now?—can the Southern white woman work now, without forfeiting her social standing, in any way in which the public sentiment of ante-bellum times would discount her social standing if she engaged

in such work or self-support? What of the numbers and kinds of vocations open to woman then and now, and the pay given her for her work?

4. How have the changed conditions affected woman's domestic and home life in the South—the pleasures and trials of housekeeping, the servant problem, and other features of home life that may occur to a woman? Wherein has social life as it affects woman undergone any change in the South? What do Southern women think of "woman's rights"? What are woman's true place and work in the economy of human life?

The reader will be interested in the answers which these questions elicited from the thoughtful women to whom they were addressed. We make no apology, therefore, for occupying a large portion of this paper with quotations from the answers received in reply to the foregoing questions. We quote first from one of the least hopeful of all the replies received. It is from a Virginia lady who comes of a literary family, has long lived at one of the leading literary centers of the South, is an authoress herself, and a contributor to the periodical literature of the day. She writes:

The theme that you present is an intensely interesting one to me. As to whether the changes resulting from the war have proved a blessing or a misfortune to Southern women—I think there never were nor can be any purer, nobler women than those who lived in the South during the days of slavery and the war. And it is because the Southern woman is the same creature now that she was then that she has not been injured by the hard conditions of the present. Woman's education has advanced with mighty strides during the last fifty years, but freeing the slaves has had naught to do with it. There are ever so many more literary women now than then—not that there was not equal literary taste in old times, but there was needed the goad of poverty to force the Southern women from the loved retirement of the domestic circle into the gaze of the public. The changed nature of domestic service is altogether evil in my eyes. Young housekeepers have a much harder time now, comparing my daughter's trials with those of my own young life, though we had our annoyances from servants then. The middle and lower classes who never owned slaves and were inured to labor have been much less affected by the changes introduced into domestic life since the war. As to the respectability of self-support in woman, sensible people were the same in the old times as in the new, but the necessity for a woman supporting herself rarely ever existed then. Brothers and male relatives never used to suffer female members of their families to toil, as seems a matter of course now. If woman must struggle for self-support, it is delightful to contemplate the many avenues opening up to her whereby a livelihood may be gained. I think the tendency of the times is to broaden greatly the sphere of feminine activity. The social life of woman in the South has in my judgment changed very greatly for the worse,

in that much less deference to womankind is entertained by the rising generation of young men. Ordinary attentions are withheld from young ladies, and escorting them spoken of as a burden in a manner shocking to one brought up in a former and more chivalrous generation. As a whole, then, I fear I must decide that the present conditions of society in the South are not most conducive to woman's happiness and best estate; but so confident am I of the ability and disposition of Southern women to rise superior to circumstances, that I neither worry over their present nor tremble for their future.

We next quote from a most intellectual and thoughtful Tennessee lady of threescore and ten years and more. She writes from a home of wealth, refinement, and literary and moral culture. Five generations of her family have lived in the same home, and her grandchildren to-day eat their meals almost over the same spot where her grandmother ate—which circumstance has few parallels in the South, or in any other part of the country. Her home, once two miles "in the country," is now in the midst of a populous city of a hundred thousand inhabitants, which, for its literary culture and its numerous educational institutions, is justly titled "The Athens of the South." She writes:

The women of the South were characterized by a certain refinement and elegance of manner, the result of generations of wealth and freedom from toil. The same qualities are discernible in their descendants, even in those who were impoverished by the war. I do not think, as some do, that white children were contaminated by association with negroes. I believe the finer nature always maintains the ascendancy over the coarser. There has been improvement in the physical development of woman in the South, but it is due, not to the abolition of slavery, but to the advance which has been made in the study of hygiene and the introduction of the gymnasium into the schools. Women receive better education now than before the war, spending, on an average, four years more in the school-room now than then. As a rule our Southern academies thirty years ago graduated girls at sixteen, and often younger. The crowning glory of the present age is that every woman is free to develop her own personality. Formerly the ultimatum of a Southern girl's existence was marriage, and an old maid was an object of pity. Now, thanks to the public schools, any girl, however humbly born, may secure an education and by the force of her intellect command an honorable position in the best society; and if she does not marry it is because she has not met a man who is her equal in mental culture and at the same time more able to take care of her than she is to take care of herself.

You ask, "What of the respectability of self-support then and now?" I answer that in the two cities with which I am familiar the most popular women in society are self-supporting women—

teachers. The women of the present day, moreover, having been compelled in many cases to give personal attention to cooking, have made an intelligent study of the subject, and it has now become one of the fine arts. Mistress and servants have come to recognize their dependence on one another, and in most families the relations between the two parties are regulated by mutual forbearance and good will. In social life the topics of conversation are far more varied and more elevating, in consequence of the general spread of education and literature. The time is past when a woman can entertain her friends with a detailed account of her latest illness, or can dare to bore them with a recital of the precocious sayings and doings of her children. Still, I say, and I hope all my sisters in the South will say with me, far distant be the day when the women of this country will lay aside the modesty and delicacy that so well befit them and undertake to compete with men in business, or in public and political life.

Let us place by the side of this letter from a Southern grandmother the views of a young woman who has come to maturity within the past ten years, and who therefore represents the new generation of young Southern women, who believe in the new order of things, and have no bitter memories of the past. She writes:

There is no point perhaps wherein the Southern ideal of woman has changed so much as in the nobility of helplessness in woman. Before the war, so far as I have been able to learn from contact and conversation with those whose knowledge and experience antedate my own by many years, self-support was a last resort with respectable women in the South, and such a thought was never entertained so long as there was any male relative to look to for support, and men felt responsible for the support of even remote female relatives. So deeply embedded in Southern ideas and feeling was this sentiment of the nobility of dependence and helplessness in woman, and the degradation of labor, even for self-support, in the sex, that I have heard of instances where refined and able-bodied women would allow themselves to be supported by the charity of their friends rather than resort to work for self-support—and this not because they had any reluctance to work, but because livelihood by charity seemed to them to be the more respectable and honorable alternative of the two. Such instances may not have been very numerous, but they were at least of frequent enough occurrence to show the strong prejudice that existed in the South before the war with reference to white women working. Of course this does not mean that the thousands of wives, mothers, and housekeepers throughout the South did not perform the duties incident to their situation. It was single ladies, and those who had no means of support within their own homes, whom public sentiment forbade to work for self-support; or if they did, it was at the expense of injuring or entirely forfeiting their social standing, and hence was to

compromise themselves and their families. Now, on the contrary, a woman is respected and honored in the South for earning her own living, and would lose respect if, as an able-bodied woman, she settled herself as a burden on a brother, or even on a father, working hard for a living, while looking to more-distant male relatives for support is now quite out of the question. As a woman is now respected and honored, rather than discounted socially, for earning her own living when necessary, the field of labor for women is constantly widening. While she would not injure her social position by earning a living at any calling open to her sex, yet, socially, teaching and other forms of literary work have the advantage, and are to be preferred. Other callings, though not exactly tabooed by the sex, yet have such objections to them as would cause a young woman's friends to ask, "What makes her do that? Could n't she get a place to teach?" This increasing tendency among women to earn their own living by teaching has raised the standard of thoroughness in female education to some extent, though much is still to be desired, especially in the larger schools, where girls are too often sent to be "graduated" rather than to be educated. Southern people, having passed through the financial reverses of the war, now realize as never before that a daughter's bread may some day depend upon herself, and so they want her well educated. And as a thorough knowledge of a few things is a better foundation for self-support than a mere smattering of many accomplishments, there is more tendency toward specialties in woman's education than before the war.

I am inclined to think, however, that there were proportionately a larger number of cultivated women in the South before the war than since. On the old Southern plantations women were thrown more on their own resources than in the crowded cities toward which Southern life and wealth now tend, and so were sent to the fine old libraries for that daily diversion the modern woman gets on the streets or in the frivolous social circle. Southern people before the war used to keep "open house" the year round, and were always ready to welcome a guest for the sojourn of a day or the visit of a month. This constant entertaining of refined and cultured people brought the Southern woman in contact with the best thought of the day and magnified her office as the center of the social and home circle. This necessity of cultivating conversational, literary, and social gifts whereby she might be at her ease in entertaining her guests led her to attain to a standard and ideal of social culture far too seldom seen in the Southern women of the present day. With the loss of wealth, and with the changed domestic service, the hospitality of former times became an impossibility after the war, and with it went some of the grace of manner and conversation that had been developed by constant practice in the Southern woman before the war.

There are not many Southern girls reared entirely since the war who could express themselves more clearly and forcibly than this young woman has done in the above quotation. It

will only add to the value of her views to say that she belongs to a family that stands socially among the best in the community where she resides, and her financial circumstances are such that she has never been under the necessity of working for her own support — which fact renders her statements concerning the honor and social respect in which genteel women working for self-support are held all the more worthy of acceptance, because they are not biased by her own condition in life.

Everything is entirely changed to our Southern women since the war [writes another correspondent from one of the Carolinas whose memory of better days before the war and whose trials and tribulations in housekeeping and in providing a support for herself and others since the war make her the representative of another class of Southern women whose views she very faithfully portrays] — I mean, of course, our cultivated women. From being queens in social life, mistresses of large families, providers, guides, and disciplinarians of large households, and dispensers of a lavish and royal hospitality, they became after the war, in many instances, mere domestic drudges, and wore their lives out in trying to find the wherewithal to keep actual want outside their doors. This class of Southern women, it is true, are now rapidly passing away, and their vacant places are being filled by their daughters and granddaughters, whose lot is happier and whose future is hopeful and promising. But the history of Southern womanhood as affected by the war cannot be faithfully told without presenting in all their dark outlines the trying and terrible experiences through which the great majority of our noble women have had to pass during the quarter of a century that has intervened since the close of the war.

It is the domestic and home life of woman that has been most seriously affected by the great changes that have come over the South. In the days of slavery the Southern housekeeper had about her trained and competent servants who rendered her implicit obedience, knowing that, if they did not, they would be at once remanded to the harder labors of the plantation. To have to exchange these trained house-servants for the incompetent, ever-changing, and worthless hired servants that took their places after the war was indeed a great trial. Many a refined woman, living in affluence before and during the war, was now compelled through poverty to perform all her household duties herself, or if barely able to hire help, it was only the cheapest and most worthless that she could secure, to manage whom was often more vexatious and trying than to perform all duties herself. The servant problem is becoming less annoying, but even now many a Southern woman's leisure is consumed in teaching incompetent servants or in doing their neglected work; and if perchance she succeeds in training one to a point where efficient and satisfactory service is rendered, every housekeeper knows by unhappy experience how liable such a servant is to decide suddenly to quit work

or to enter another's employ — and she may leave at night (especially if she has been overpaid) without any warning that she will not return for breakfast the next morning. And so the Southern women of recent years have had numberless trials and vexations in these and other lines never dreamed of by their mothers. To exercise the hospitality of former days has become an impossibility in most households, a tax to spirit and nerve that cannot be borne. Visitors are not now expected to take a meal or to spend a day except by special invitation. "Old things" in this respect have passed away.

Woman's opportunities for work have increased. The number of single women who support themselves, and of married women who help their husbands in supporting their families, is much larger than before the war, and this class of women is more respected than in ante-bellum times. The number of vocations open to women is of course much larger than before the war, but the value in money of woman's work is shamefully depreciated. No matter what work a woman does, men will not pay her its full value, not half what they would pay a man for the very same work. There is proof of this unjust discrimination in almost every female college in the South where men and women are employed to do the same or equal work as teachers, not to speak of other callings where they are performing exactly the same work for very unequal wages.

If then we look at this question concerning Southern womanhood in the light of the present and of the more hopeful future, rather than of the past succeeding the war, I can say that in my judgment the freeing of the slaves and the changed conditions of life resulting from the war have proved a blessing to the white women of the South. It has taught them the value of actual labor with their own hands; it has taught them that the hardships and trials of life teach useful lessons, and have their rewards. It has proved to them that poverty does not necessarily degrade, that culture and refinement may preside in the kitchen, mold the biscuit and watch the griddle, turn the steak and bake the cake, but that wisdom and economy must be constantly exercised or there will be little time for anything but these homely duties.

We next present the views of a gentleman who has been an educator of Southern girls for the past forty years, and is at present at the head of one of the largest and most prosperous female colleges in the South, having enrolled during the past year over four hundred pupils. The fact that he has had large experience, both in ante-bellum and post-bellum times, in female education, and has been a diligent student of every problem pertaining to Southern womanhood, entitles his views to serious consideration in a discussion of this theme. He writes:

I am firmly persuaded that the effects of the war in the emancipation of the slaves have been of the most salutary character in their influence upon the social, the intellectual, and the moral development of the white women of the Southern

States. The abolition of slavery has, in the first place, freed white children in their earliest years from the contaminating and degrading contact with negro associates, such as was universal in the best families in ante-bellum times. One reared under such associations has only to recall his own recollections of the demoralizing influence of daily and hourly contact with a race of narrow intellect and of low moral development to realize at once what a great and beneficent change has been produced by the total disruption of those damaging ties. The association was good for the negro, because he was, on the whole, being lifted to a higher plane, but his elevation was purchased at a fearful cost to the unwitting whites. I do not mean to declare that this demoralizing influence was exerted to such a degree as seriously to threaten the higher civilization with collapse and overthrow, but that it was preventing the full development of the capabilities of the dominant race will, I think, be admitted by all thoughtful observers and students of social phenomena.

With respect to the education of girls, I think it has been very materially improved by the changed conditions. Before the war my pupils were very largely from the wealthy class of Southern planters. They were reared in affluence, had no necessity, and therefore no expectation or desire, to turn their education to any practical account in the way of bread-winning, and hence did not choose the studies calculated to aid in the struggle for self-support. In saying this I am not reflecting on the individual pupils, who as a class were of the highest social and moral worth, but the whole framework of society forbade the thought of self-maintenance on the part of women. The South still clung to the chivalric interpretation of woman's position, as a kind of superior being to be carefully guarded from the rude asperities of every-day existence. Now this state of affairs is necessarily changed by the enforced impoverishment of the Southern women. As a consequence the class of girls who realize the necessity of doing something for their own support has largely increased. They have become more earnest in their prosecution of education; they adopt and pursue with energy courses of study calculated to equip them for active and remunerative service in the world; they manifest a more enlightened interest in the great world-problems that agitate modern society, such as the movements of moral reform, the operations of government, the enlarged forms of Christian activity in the churches, like the work of foreign missions; they are more interested in the industrial and educational development of the South than was the case before the war. The proportion of girls seeking a collegiate education has increased, and it is my opinion that they remain longer at college than in former times. The increase is largely in the middle classes. Before the war the education of girls in college courses was, so far as my observation extended, restricted very much to the daughters of the wealthier people. I then had no pupils preparing for their own support. But now I think it safe to say that twenty-five per cent. of our girls look to supporting themselves when they leave college, and this notwithstanding the

fact that the wealthiest classes are now, as then, among my patrons. The result of this increased number of women seeking self-support has been to make them more earnest and diligent in the prosecution of their studies.

In reference to housekeeping problems now as compared with former times, it is my judgment that the freedom of the slaves has rendered the domestic life of woman more pleasant. The free man or woman is found to be as good or better, as a worker, than the late slave in a like position. The ability to read and write has been seen to enhance very greatly the value of certain classes of domestic servants. Servants, on the whole, are as docile and as easily controlled as when they were in bondage, while the freedom of both parties enables the person hiring to dispense at will with an unprofitable and disagreeable servant. Under the old system of hiring by the year, he who made a bad bargain in securing servants had a year's purgatory in consequence of his mistake, while now an hour's notice may terminate the unpleasant relationship. Nor, if a disagreeable servant was owned and not hired, did this prevent him from being a source of ceaseless vexation and annoyance to those with whom he had to do. I think, as a consequence, that the domestic life of our Southern women is relieved of one of its most annoying and demoralizing elements. I have yet to hear the first Southern woman lament the freedom of the negro.

As to the effect of the great change upon the social life of woman, I will simply say that in my judgment there is less of the foolish reliance upon aristocratic antecedents in the society of the South, and a more noticeable tendency to accept people upon their intellectual and moral qualities and personal merits than in former times.

The views presented by these writers represent fairly, in my judgment, the different phases of opinion existing in the South with reference to the question under discussion. It is doubtful whether refined womanhood has ever in the history of this country endured such trials and hardships, especially in domestic life, as the women of the South underwent during the ten years immediately succeeding the war. But they were equal to the severe ordeal, and out of it they have come stronger in character and all the better prepared for the new conditions under which they now live and labor.

If there is anything for which the white people of the South have occasion to be devoutly thankful during this closing decade of the nineteenth century it is that the incubus of slavery has been lifted from their shoulders, and thereby the most serious obstacle to their highest prosperity and development as a race has been removed. Those who fought for the freedom of the slaves did so that they might bless the negro race, and whatever blessings have come to them, or may in the future come to them, from their emancipation, are a cause of gratification to the whites among whom they live,

as well as to themselves; but the most noticeable result which has thus far come from their emancipation is its effect upon the white race of the South, who, deprived of their slaves, have been thrown upon themselves and their own resources, and, thus forced by necessity, have gone to work in industrial and intellectual lines as they never would have done had slavery continued, and have already produced more in these twenty-five years in the development of a literature and of various wealth-producing industries than in all their previous history. In recognizing and emphasizing the great advantages that have come to the white race by the freedom of their slaves, we are surely making no reflection upon our fathers and mothers who believed in, and tried to perpetuate, a system which they inherited, and whose evils they largely mitigated by their kindness and benevolence—a system originally introduced among them not more by their own volition and seeking than by the slave-trading ships of England and New England seeking among them a market for their captive slaves, but which system, though open to just condemnation and destined to inevitable overthrow, was yet carried on by them with such consideration for the slaves that, in spite of all attendant evils and all individual cases of cruelty and oppression, those who entered their servitude as uncivilized pagans of the lowest order were, during the period of their bondage, transformed into creatures of such intelligence and moral character that the general government of the United States considered them, immediately upon their emancipation, worthy to be invested with the right of suffrage, and all other privileges of American citizenship along with the Anglo-Saxon race. The women of the South, with rare exceptions, treated their slaves with a conscientious sense of moral responsibility for their welfare, and with a consideration and kindness far above that which hired servants, in any country, generally receive from their mistresses.

The growing respectability of self-support in woman is everywhere recognized as one of the healthiest signs of the times. The number of vocations open to women is constantly on the increase. Some modes of self-support are, and always will be, socially more respectable than others. In the report for 1888 of the Commissioner of Labor concerning the number and condition of working-women in the large cities is the following concerning Charleston, South Carolina:

In no other Southern city has the exclusion of women from business been so rigid and the tradition that respectability is forfeited by manual labor so influential and powerful. Proud and well-born women have practised great self-denial at ill-paid conventional pursuits in preference to

independence in untrodden paths. The embargo against self-support, however, has to some extent been lifted, and were there a larger number of remunerative occupations open to women, the rush to avail of them would show how ineffectual the old traditions have become.

A similar report for 1890 would show rapid changes and advances in public sentiment concerning the respectability of self-support in women, and would reveal that the "embargo" had, in most parts of the South at least, been entirely removed.

If we look at the South as a whole, and not at individual portions of it, it is unquestionably true that the great changes which the past thirty years have witnessed have wrought most favorably upon the intellectual life of Southern womanhood. The conditions under which Southern women now live are far more favorable for developing literary women than those existing in the days of slavery. In 1869 a volume was published by Mr. James Wood Davidson entitled "The Living Writers of the South," in which 241 writers are noticed, of which number 75 are women and 166 are men. Of the 241 named, 40 had written only for newspapers and magazines, while 201 had published one or more volumes, aggregating 739 in all. Although this book was published only four years after the close of the war, it was even then true that from two thirds to three fourths of the volumes mentioned in it as having been published by women—not to speak of the others—had been written and published after the opening of the war. They had been called forth by the war and the trying experiences following it. Whether the changed conditions under which we live have anything to do with it, it is nevertheless certainly true that there have been more literary women developed in the South in the thirty years since the war than in all our previous history. By literary women of course we mean those who are writing and producing literature, not mere women of culture and education.

One of the best results [says the author of this volume], I believe the very best result, of the war was its influence in awaking and developing dormant genius. Many, aroused by the stringent necessities incident to such times, have bestirred themselves to think, to create thoughts and to give utterance to them. Many have learned in suffering what they taught in song. Many sprang at a bound from the nothingness of ordinary life to the true sphere of aspiring and gifted genius. . . . The contrasts in the life of Southern womanhood between the leisure and luxury of ante-bellum times and the trials incident to the war and subsequent to it, between the unawakened dreamy ease of peace and happiness and the positiveness of a genius fully aroused, are in every sense striking and significant.

Of a certain authoress he says:

Prior to the late disastrous war this lady, in virtue of her personal accomplishments and social position, ranked among those who gracefully dispensed the elegant hospitalities of an ideal Southern home. The close of the war found her in the midst of the wrecks of that society to whose refined intercourse her talents had conspicuously contributed, shorn of her husband and her property "at one fell swoop," and apparently utterly cast down. But from these very circumstances of desolation came a new birth. The vivacious woman of society, driven by the spur of necessity, appeals to her pen, and the result is a discovery which, but for her distress, would probably never have been made by the public or herself, viz., that she has very remarkable gifts for narrative description and other kinds of literature.

The fact that so large a proportion of the young women now attending Southern colleges are securing an education not for ornament but for use, not for social culture merely but in preparation for self-support, has had the very natural effect of making them more earnest and diligent in the prosecution of their studies. A much larger proportion of college girls comes now from the middle and poorer classes than formerly. Many of the poor girls of the South to-day are the daughters of educated parents whose property was swept away during the war, their culture surviving the loss of home and property. And what will an educated and refined mother not do, what sacrifices will she not make, in order that her daughter may have the benefits of an education? If poor she will practise the most rigid economy and submit to the severest personal self-denial if thereby her daughter is enabled to enjoy the advantages of an education; and many are the Southern mothers who since the war have done this, and more, to give their children an education. And there are many noble instances in which an elder daughter, having been thus educated through the labor and economy of her parents, has generously requited their loving self-denial in her behalf by going to work herself and helping each of her younger sisters to obtain the education which their parents were anxious but unable to give them.

It is Victor Hugo who has called this "the century of woman." It is certainly an age that has witnessed great changes in the life, education, and labor of women everywhere; and these changes have all been in the direction of enlarging the sphere of woman's activities, increasing her liberties, and opening up possibilities to her life hitherto restricted to man.

It is a movement limited to no land and to no race. So far as this movement may have any tendency to take woman out of her true place in the home, to give her man's work to do and to develop masculine qualities in her, it finds no sympathy in the South. The Southern woman loves the retirement of home, and shrinks from everything that would tend to bring her into the public gaze. The higher education of woman, which has been so widely discussed of late years, and to encourage and promote which such noble schools for women as Wellesley, Vassar, Smith, and Bryn Mawr have been founded, and so many great male universities in the North and in England thrown open to them, is duly recognized and felt among the young women of the South. This wide-spread aspiration of Southern young women for broader culture finds expression in the eagerness with which they are seeking admission into the best of the higher institutions provided for males, and this not because coeducation finds favor in the South,—for it is, perhaps, less encouraged here than in any other part of the United States, though the prejudice against it is weakening somewhat,—but only because there is no higher institution of learning for women which provides for them the extensive facilities and broad culture furnished by at least a few institutions for young men. Many feel that the greatest educational need of the South to-day is of an institution that will provide for young women as thorough an education and as broad a culture as is provided for young men at the University of Virginia, the Vanderbilt, or the Johns Hopkins—an institution that will not be in competition with any existing female college in the South, but will hold itself above them all by establishing and rigidly maintaining high conditions of entrance as well as of graduation, and whose pride will be the high quality of the work it does, not the number of pupils it enrolls, though numbers would also come in due course of time. The active, earnest, vigorous young womanhood of the South is demanding such an institution. Surely a demand so just and a need so widely and seriously felt cannot go long unmet. Where is the philanthropist who will bless his own and succeeding generations, and make himself immortal in the good he will do, by giving to the young women of the South a Smith College, or a Wellesley, or a Vassar? Is it possible that a million dollars could be spent in any way where it would accomplish more good than in founding such an institution for the daughters of those noble women of whom we have written?

PAINTED BY A. MENZEL.

ENGRAVED BY H. WOLF.

TIGER.

A GREAT GERMAN ARTIST—ADOLF MENZEL.

WITH ILLUSTRATIONS OF HIS WORK.

AT THE SPINET.

MENZEL is a little giant,—if I am not mistaken, about one and a half or two inches smaller than Meissonier,—and, with his seventy-six years, as young as most of the young artists of the present generation.

For a long time Menzel's work was understood and appreciated only by the very few, and even now little of it reaches the hands of art-dealers. Neither is his work in itself of the popular kind. In the great mass of his productions there is to be found every artistic element, every note in the music of form and color. His pictures range from the quietly sentimental to the sublime and the dramatic.

How Menzel could master so vast a field seems almost incomprehensible. One is reminded of the strength, many-sidedness, and multiplicate ability of some of the old masters.

If there is one direction where Menzel might seem comparatively weak, it is only in a certain lyric quality, with which indeed he has never exactly been in sympathy from the very beginning of his career. Menzel's art is always more manly than lovely; and yet in contradiction to this apparent exception he has shown many an interesting and fascinating example, as, for instance, in "Illustrations to the Works of Frederick the Great." A small sketch giving the portrait of the Marquise de Pompadour is a charming example of graceful and lovely arrangement; and again the frame about this picture, being of his own invention, illustrates in allegoric ornamentation the story of this woman as well as the character of the life at the French court in her day.

"Saying a great deal" with the most refined and modest artistic means is one of the chief characteristics of Menzel. The book just mentioned contains about two hundred drawings

QUICK SKETCH OF RICHARD WAGNER AT A BAIREUTH REHEARSAL.

on various subjects. It was an order by King Frederick William IV. in 1843, and was completed in about six years. It was at first issued in an edition of only three hundred copies, which were not destined for the market, being presented by the king to libraries, public institutions, and to men of note and merit whom he wished to distinguish by the gift. In 1882, however, a popular edition was printed. In such works as this Menzel is never a slave to the word, and both text and illustration remain independent in spite of their coherence. It is surprising to see how successfully this artist recreates, as it were, in his own art and in his own material the written motive.

The inclination to allegorize and explain by symbol, to philosophize with the pencil, can be traced back to a very early date in the artist's career. Even in his appearance before the public with a series of drawings, "Artist World Wanderings," which he completed while still a boy of seventeen, he explains the composition

with a small allegory at the foot of each print. A striking example of his peculiar way of transcribing and explaining by picture a philosophical thought is a small vignette belonging to the volume of the "Works of Frederick the Great." In an "Epistle to my brother Ferdinand" Frederick contemplates the different varieties, the nature and vanity, of human wishes: "What we have we neglect and never appreciate sufficiently, while we strive in vain to possess what we cannot achieve." Menzel shows a bird-cage through which is laid a twig from a cherry tree rich with ripe fruit. The little prisoner within pays no attention to the delicious offering, and is painfully engaged in trying to escape from the cage; while another bird outside, in total disregard of his liberty, eagerly tries to push through the wires of the cage in order to reach the cherries.

Unless these story-telling, philosophical illustrations were artistic equally in conception and execution, so that in a certain sense one could easily sacrifice the thought for the picture, Menzel would be guilty of the mistake formerly often made and still sometimes made by German artists, who seemed to forget that color and form were their material, and that the most beautiful thought and motive amount to nothing if not beautifully expressed. Menzel has rediscovered for himself this lost principle long before his contemporaries.

It is a fact, also, that he understood over forty years ago what is now called the "modern" in art — *plein air*, truth, naïveté, simplicity, and the impression of the moment; and in historical painting that the soul of the picture is the event, and that the various hats, buttons, bows, spurs, and straps of the costume are not the most important elements. He recognized the value of the true inner relation of one figure to another, subordinate to which should be absolute historical truth and scientific correctness of all accessories, not forgetting always *the picture*.

Menzel well justifies these principles in another work, "Frederick and his Paladins." We absolutely believe in each of the figures, and while enjoying the wonderfully characteristic appearance of these soldiers are not at all distracted by details of garment and uniforms. It is only by closer examination that one may recognize the immense study, the tremendous labor, the conscience and zeal with which the artist followed up all the sources pertaining to

A SERMON IN THE OPEN AIR.

his subjects. And it is interesting to see by his sketch-books how faithfully and thoroughly he went to work. It was not sufficient for him to sketch an object in the view he wished to give of it, but he must draw a gun, a sword, a *porte-épée*, a saddle, from two, three, four, and even five different points of view, making himself so accurately acquainted with the object that in his mind he seemed to have it before him in plastic form. Even with portraits we find him following the same principle, as, for instance, in a historic picture, "The Crowning of King William I. at

Königsberg." His sketches and studies for this show numerous heads of illustrious persons from all sides, and so thoroughly characteristic are these that one is left in no doubt about the likeness whatever. This picture, in its beautiful, mellow golden tone, has often been criticized very severely and unjustly, for it is only the subject itself that is unsympathetic. It was an order from the court in Berlin, who wished the event portrayed absolutely as it happened, and allowed not a single artistic liberty. The portraits are innumerable. The interior of the

SHARPENING TOOLS IN A VILLAGE SMITHY, NEAR GASTEIN.

Protestant church is unpicturesque, and the whole subject is not of the kind that would have inspired an artist like Menzel; nevertheless he solved the enormous difficulties in a marvelous manner. Unluckily this picture, like a great many others, is not easily accessible to the public, being placed in the palace at Berlin. Among a large number of smaller ones in the palace there is also a huge canvas representing "The Night at Hochkirch," the foreground figures of which are over life-size. It is the battle of Hochkirch, on the night of the 14th and 15th of October, 1758, when the fate of the Prussians seemed hopeless, the lines of the Austrians closing in upon them from all sides. Frederick, with his aide-de-camp, suddenly appears and takes command, and with one last effort the grenadiers hasten to the front.

On the occasion of the celebration of Menzel's seventieth birthday, in 1885, the Academy in Berlin arranged an exhibition with as many of his works as could be obtained. There were several hundred pictures and studies to be seen, and this picture was among them. It is not presumptuous to declare this battle-scene to be probably the best of its kind, without a single exception, new or old. The vigor and life of the dramatic scene, the wonderful effect of light coming only from a burning village, the

breadth and boldness with which the subject is treated, have never been surpassed, and justly may this picture be considered the finest example extant of "war-painting." It rouses and astonishes one as does the "Night-watch" by Rembrandt in Amsterdam, and, once seen, it never can leave the memory. Had Menzel painted only this one picture, he would rank among the best artists of all nations and of all times.

The person of Frederick the Great seems to have made a deep impression upon Menzel at a very early date, and at a time when Frederick was not so much thought of as now. Menzel took a great fancy to the figure of Frederick, and has now in fact created and fixed the picture of this monarch for all coming ages. His works on the subject are very numerous, and are probably the most reliable source for the knowledge of this royal personage.

Frederick's army was a motive of equal interest to him. He treated it in three vast volumes, containing a minute description and explanation, by means of highly artistic illustrations, of the uniforms, customs, and character of all the regiments and classes of soldiers. Not only is the appearance of each soldier in the different uniforms given, but also each habit and custom, as well as the manner of carrying and using the weapon, of wearing

the garment, and the fashion of the hair, mustaches, and wig.

"Frederick's Time" is the title of a book containing the portraits of Frederick's generals, and "Illustrations to the Works of Frederick the Great" make two large volumes of drawings. "The Life of Frederick the Great by Kugler" contains some four hundred engravings, which book, I believe, is one of the artist's first more elaborate attempts. Then follow "Events in Brandenburg History," and, later, his most wonderful "Broken Jug," a comedy by Kleist. Indeed, Menzel's illustrations alone would be enough to fill an ordinary lifetime, and yet they are only a relatively small fraction of what he has produced in all the fields of art, and with every material known.

Menzel in his childhood was a "wonder," but luckily he was not ruined and misled by early worship and exaggerated praise. He was forced to rely largely upon himself. His

an artist instead of a "student." Soon after the school days father and son were deeply engaged in the little lithographic establishment, and often did they sit together working at one table, but not always in perfect agreement with each other. The son was more interested in the artistic elaboration of a subject, while the old gentleman's inclination was to make lithography a lucrative undertaking. Still he had the proper interest in his son's future, and for his sake removed to Berlin in order to send young Menzel to the academy. The boy had no sympathy with academic training, and when he entered the class to study from the cast he at once felt how little this manner of education was suited to him. The result was that he soon left the institution.

Instead of submitting to academic training he chose to wander about the city from one art-dealer's window to another. The old copperplate engravings on exhibition there seemed

FREDERICK AND HIS MEN AT HOCHKIRCH.

father, however, was a clever man, who, having conducted a young girls' school, ceased teaching in order to exercise the new art of Senefelder's lithography. He detected the child's genius very early, and paid careful attention to the boy's education. Young Menzel was at first expected to enter on a scientific career — until finally the father allowed his boy to become

to interest him more than anything else. For hours he was to be found at these places, as often before in his native city of Breslau.

Aside from his interest in engravings he had a sensitive eye and an open mind for the architecture and mural paintings in the various churches by the numerous Italian masters of the eighteenth century. It was Menzel who

THE PROMENADER.

THE RETURN OF THE HUSSAR PATROL.

later on taught his people the beauty and refinement, grace and elegance, of the rococo, and convinced them that the art and style of this period were not to be neglected and despised, as was frequently the case in the beginning of our century and long after.

To what degree young Menzel had cultivated technic even at the age of thirteen may be seen in a composition, "Publius Cornelius Scipio and Lucius Metellus in the Roman Senate," executed in pencil in the manner of a steel-engraving. That this was the attempt of such a youth no one would believe, and the picture is still more surprising as an evidence of early cultivation.

About the time that he entered the academy his father died, leaving to his son all the responsibility for the family. He cheerfully took his father's place in business, and willingly fulfilled all orders, which often were far from being of an artistic nature. But wherever he found the least possibility he tried to apply the principles of his art, thus cultivating and developing his inventive power. He was asked to make everything—labels, show-cards, letterheads, cards, vignettes, diplomas, etc. A peculiar manner of adapting the ornament and improvising the arabesque are his invention, of which we have most striking examples in the various diplomas designed by him. One of the finest designs in this direction is "The Lord's Prayer," made in 1837,

when Menzel was only twenty-two years of age. The pencil and the needle on stone were his favorites until he was twenty, when he first tried paint, dropping this material very soon, however, in disgust and disappointment. The point seemed more natural to him. By and by, owing to a great extent to the persuasion of his friends, he again took up color, and at once seems to have found his way into the secrets of his new material. "At the Lawyer's" was his first exhibit, which, being disposed of very soon, gave him encouragement in a field which he has since cultivated with great success.

In independence, originality, and power of invention Menzel is unsurpassed. No material, no style, no genre, has remained unknown to him, and in each has he produced most excellent examples. His love for nature and truth in his studies are unbounded, and the ardor and alacrity with which he began as a young man have not left him to this day. He works incessantly, and finds that everything is worth studying, that everything is of interest to him, and whatever he does bears the signature of art.

It is said that the number of his portfolios with studies and sketch-books is so vast as to appear like a library. When a young student once came to him inquiring about designs, patterns, and motives in wrought-iron, Menzel brought forth his studies in such numbers that

it appeared to the young man as if the master could have done nothing else in his life, so abundant were his studies in this one subject.

Sometimes it has been said that this greatest of German artists produces more with his brain than with his heart and his soul. If this is true, how wonderfully must this brain be constructed to bring forth such marvels!

Standing at the front with the greatest and best of his time, with an immortal name, an artist whose work will be an example as long

once asked why he would not explore other countries, he exclaimed that there was so much to study about him that never in a lifetime could he conquer more than a small fraction of it. To Paris and Brussels he has gone now and then to inspect exhibitions. In Meissonier he found an enthusiastic admirer and friend, and there is an anecdote concerning the intercourse between the two which, if not true, is at least well invented and most characteristic. Meissonier could not speak German, and it was

CONTRIBUTION.

as there is love for art and the beautiful in this world, Menzel is most modest in character. When asked for an opinion, he is candid and true, possibly severe, but never without kind consideration. When he visits exhibitions he examines every picture, and seems to find something, be it ever so little, to admire in each.

It seems singular that he has never made a study-trip in the sense in which they are undertaken by students of art. He has never seen Italy save the city of Verona, and when

difficult for Menzel to make himself understood in French; nevertheless they walked about together, and contented themselves in now and again grasping and pressing each other's hands in reciprocal appreciation.

Menzel's "Modern Cyclops" and his "Ball Supper" are pictures ranking among his best, and although he is an old man to-day, we may expect many more pictures from this great artist, whose device has ever been: *Nulla dies sine linea*.

Carl Marr.

NOTES BY OTHER AMERICAN ARTISTS.

LIKE other men of rare make-up, Menzel dared to stem the flow of traditional thought and prejudice, and in return suffered much from ridicule. The distinguishing merits of his art are many. He is spontaneous, frank and direct, brilliant and vigorous, and often audacious and unrelenting in

his truthfulness. While his canvases are absolutely based on actual observation, they never tire us with commonplace facts; these he makes subservient to his greater truths, while their reality suffers but little thereby. Some men draw with their fingers, some add the force of their hand, fewer

successfully bring their arms into play without injuring the delicate touch that their fingers may have given their work. Menzel stands with Meissonier and Barye among the few who bring fingers, hands, arms, body, and every available muscle and sensitive tissue to bear on the result; and this with such a brilliancy and conviction of being in the right that the contemplation of his work must bring a flush of fire to the heads of all sensitive fellow craftsmen. It is a veritable privilege to live in his time and, too, to see the work of those he has influenced — like our own Abbey. The *spirit* that lives in Menzel appeals to all, no matter what our individual ideas may have led us to prefer. This inner fire it was that made Menzel and upholds him in old age. The “prophet of the ugly,” as they called Menzel in 1835, or thereabouts, was first appreciated thoroughly by Fortuny, says Friedrich Pecht. “He imitated the sparkling brilliancy of his touch and color, and developed it with amazing success; in the conception of mankind and times, however, he could not approach Menzel’s art.” Herr Pecht is also authority for the statement that Menzel’s grasp of character had never been equaled before his time. The Dutch masters represented one type of people. Hogarth and Wilkie, however, succeeded in improving in the direction of character-study what had been attempted before their

day. They limited themselves to certain classes also, whereas Menzel has portrayed king and peasant with inimitable faithfulness.

Apart from Menzel’s success as a painter of fire and artificial light, and in addition to the other qualities mentioned, he is an illustrator without a peer. His technic is as effectual and complete as it is simple and unpretentious. It is devoid of artifice or trickery, is apparently unstudied in its address, and is altogether of the careful, careless kind which is so much sighed for by many ambitious illustrators. Mr. Edwin Abbey is the most successful follower of Menzel’s pen-wielding. The late Mr. Randolph Caldecott also showed much of the good influence of this great German. A good look at the portrait of Adolf Menzel tells us much in addition to his works. — W. J. BAER.

MENZEL is one of the few shining lights of modern art, as unique in his surroundings as Jean François Millet was in his; as far above and beyond his own contemporaries as the latter was — a man who creates a school. He has been called, and not inaptly, the German Fortuny, certain tendencies, purposes, aims being akin in both, while each reserves a strong force of individuality. Truly a remarkable man when one looks at the dates on his works and considers the state of art at such times. — ROBERT BLUM.

“MAG NICHT!”

THE PLAYERS.

WITH the interesting complexity of metropolitan life there comes a specialization of the various social organizations. There are clubs nowadays for each of the professions and for each of the arts. The lawyer, the engineer, the electrician, the railroad man has now a place in the great city where he can meet his fellows and talk shop, each after his kind. Clubs for the allied arts have been attempted, but with no notable success. Literature, music, painting, and acting all pull different ways, especially when journalism is added as a fifth wheel; and the hardy vitality of The Fellowcraft, of The Salmagundi, and of The Authors shows the decisive advantage of unity of pursuit among the members of an association. The times are ripe, therefore, for The Players—the club of the actor, of the theatrical manager, and of the dramatic author. The Players is the theatrical club as The Century was originally the artistic, but in The Players the domination of the professional element is carefully guarded in the constitution. Outsiders may be admitted freely, but a majority of the board of directors must always be chosen from the members who are actors, managers, or dramatists, the three divisions of the profession for whose use and behoof the club was formed.

Nearly three centuries ago an English actor, Edward Alleyn, bought the manor of Dulwich and built there the college which still exists; and more than two centuries ago an English actress, Eleanor Gwynn, gave the land at Chelsea on which stands the hospital erected through her influence. Not a score of years ago an American actor, Edwin Forrest, died leaving his large professional earnings to maintain a home for those of his craft who should fall into poverty in their old age. These are all noble benefactions, but I doubt if any one of them is more useful in its way than the club

founded only two or three years ago by an American actor, Edwin Booth, and intended by him to be in some measure a memorial of his father, Junius Brutus Booth, one of the foremost figures in the history of the American stage, while at the same time it should be the center and home of all that is best in the American theater of to-day.

For years Mr. Booth had desired to devote a proportion of his professional gains to an enterprise of this sort, and in the summer of 1887, while on a voyage on Mr. E. C. Benedict's steam yacht *Oneida*, the matter was thoroughly debated between him and the other members of the party—Messrs. Lawrence Barrett, T. B. Aldrich, Laurence Hutton, and William Bispham. The project was put into writing at that time, and the matter rested until Mr. Booth's coming to New York in the autumn. It was on the voyage that Mr. Aldrich made the felicitous suggestion that the proposed club should be named The Players. During the autumn Mr. Booth had several conferences with two accomplished theatrical managers of New York, Mr. A. M. Palmer and Mr. Augustin Daly, and in January, 1888, Mr. Daly gave a breakfast; and then and there Messrs. Lawrence Barrett, William Bispham, Edwin Booth, S. L. Clemens, Augustin Daly, Joseph F. Daly, John Drew, Henry Edwards, Laurence Hutton, Joseph Jefferson, John A. Lane, James Lewis, Brander Matthews, S. H. Olin, A. M. Palmer, and William Tecumseh Sherman resolved to incorporate themselves into a club, which, in accordance with Mr. Aldrich's suggestion, should be called The Players.

At midnight on the last day of that year, The Players, already increased to a hundred, found themselves in possession of as sumptuous a house as any in New York. Mr. Booth had bought a fine old-fashioned dwelling, No. 16

Gramercy Park, and this Mr. Stanford White had transformed into a club-house of delightful unconventionality and indisputable comfort, perfect in its most artistic decorations, in its luxurious furniture, in its ample equipment; and this perfect club-house Mr. Booth made over to The Players by deed of gift at the witching hour when the clangor of many bells

nearly 175 out of the 660 resident and non-resident members; and they are the most frequent in attendance, especially on the midnight gatherings of Saturday, when the actor may rest, after two performances, serene in the consciousness of a clear forty hours before him. The next largest delegation is that of the authors, painters, sculptors, and architects—practitioners in the

IN THE READING-ROOM.

declared the arrival of the year 1889. Thus The Players came into being full-armed for the struggle for existence, and not enfeebled by debts and deficiencies. It began as a proprietary club of a new sort, one in which the proprietor generously presented to the members a house ready for occupancy, that every man might at once feel at home in it.

Since the midnight when The Players gathered about Mr. Booth, before the broad fire with its blazing yule log, and beneath Sully's noble portrait of Junius Brutus Booth, looking down with eyes of tenderness and subtle pity, the club has prospered. Its membership has increased rapidly until now it includes nearly every actor of reputation, almost all of the scanty band of American playwrights, and most of the theatrical managers of New York, with many from other cities. The attendance at the regular weekly suppers, when Saturday night stretches swiftly into Sunday morning, often reaches as high as sixty or seventy. The desire of the founder of the club is in course of accomplishment.

The constitution declares that "any male person over the age of twenty-one years shall be eligible to membership who is an actor, manager, dramatist, or other member of the dramatic profession, or who is engaged in literature, painting, sculpture, architecture, or music, or who is a patron or connoisseur of the arts." Those connected with the dramatic profession are the most numerous class in the club; they number

kindred arts with whom the player-folk foregather gladly; as Mr. Story says in verse:

Yet it seems to me
All arts are one—all branches on one tree—
All fingers, as it were, upon one hand.

The mere outsider admitted under an elastic definition of "a patron or connoisseur of the arts" is in a minority, although there is no need to accept Mr. Story's saying in prose, that an amateur is "a person who loves nothing" and a connoisseur "a person who knows nothing." Early in the history of The Players a tentative classification of its members into four divisions was rashly made by a scoffer: first, the Players proper,—actors, managers, and dramatists; second, the artists; third, people who lived near Gramercy Park; and fourth, millionaires. Of millionaires there are perhaps a sparse dozen on the rolls of the club, but it is a rarity to see one within the doors. There are also two or three clergymen among The Players, including the Rev. Dr. Houghton, of the "Little Church Around the Corner," who may be called the chaplain-in-ordinary to the profession, and whose request for the closing of the theaters on Good Friday night has been acted upon by many of the managers.

Keenly alive to the disadvantage of a close association of journalism with the dramatic profession, there is an unwritten law of The Players which holds as ineligible for membership

the dramatic critic, the theatrical reporter, and the out-of-town correspondent, all gentlemen whose duty it is to formulate opinions on the words and deeds of actors, authors, and managers. Thus *The Players* is free from the possibility, remote though it be, of a scandal such as occurred in the Garrick Club of London, when Thackeray had to insist on the expulsion

quatrain composed by their founder and inscribed under the marble mantel in the hall :

GOOD FRENDE FOR FRIENDSHIP'S SAKE FORBEARE
TO UTTER WHAT IS GOSSIP HEARE
IN SOCIAL CHATT LEST, UNAWARES,
THY TONGE OFFENDE THY FELLOWE PLAIIERS.

The ample hall where one may read this pertinent request is reached by low flights of

MANTEL IN THE CENTRAL HALL.

of Mr. Edmund Yates for a personal lampoon. As the members of the Fellowcraft (which is the club of the newspapers as *The Players* is the club of the theater) hang twined roses over their dinner-table to show that the words there spoken are *sub rosa*, so the members of *The Players* obey the mandate expressed in the

two steps leading up from the entrance. To the right and facing Gramercy Park is the reading-room, with the daily and weekly journals and the monthly magazines. Up half a dozen steps is a broad alcove extending over the entrance; and from this coign of vantage is to be had the best view of the portrait of

Mr. Booth, framed over the fireplace of the reading-room. This picture was presented to The Players by Mr. E. C. Benedict. It was painted by Mr. John S. Sargent, and it is one of the most brilliant, vigorous, and vivid portraits of the nineteenth century. It is a full-length, and it represents Mr. Booth standing negligently before the yule log of the hall, much as he stood on the night when he gave the house to the club. His attitude is easy, and the countenance is lighted by the kindly smile so often seen upon the face of the tragedian. What most endears this picture to The Players is that it is a portrait, not of the actor merely, but rather of Mr. Booth himself, as he is known to his fellow-members. In the alcove are portraits of Macready by Washington Allston, and of Rachel by Gilbert Stuart's daughter.

Between the fireplace and the window hangs Mr. J. Alden Weir's fine portrait of the late John Gilbert, the first of The Players to die after the club was opened. Below this is a portrait (by Zoffany) of David Garrick as *Abel Drucker* in Ben Jonson's play, now no longer acted. On the other side of the room is another picture of Garrick by Sir Joshua Reynolds, set off by a George Frederick Cooke by Sully and one of Naegle's portraits of Edmund Kean. Elsewhere in the reading-room are a portrait of E. A. Sothorn by Mr. W. P. Frith, one of Thomas Apthorpe Cooper by Gilbert Stuart (presented by the actor's daughter), and one of Robert Palmer by Gainsborough.

In the great central hall hangs a heroic picture of Mr. Booth in the character of *Richelieu*, painted by John Collier of London, and on the other side of the fireplace an excellent replica of Sir Thomas Lawrence's painting of John Philip Kemble as *Hamlet*. On the opposite side of the room hang two of Sargent's pictures—one of Joseph Jefferson in the character of *Dr. Pangloss*, the other of Lawrence Barrett in his every-day dress. Here also are a portrait of Mrs. Gilbert by Mrs. Dora Wheeler Keith, a portrait of Miss Fanny Davenport by Henry Peters Gray, one of Mr. W. J. Florence as *Sir Lucius O'Trigger* by Carroll Beckwith, and an ideal head of Beatrice painted by the president of the Century Club, Mr. Daniel Huntington.

Between the hall and the dining-room are huge safes to hold the relics and the stray curiosities which are beginning to accumulate. The treasures stored up do not as yet rival those in the Green Vaults of Dresden. Though one may seek here in vain for a wheel of the chariot of Thespis, for the mask of Aristophanes, for the holograph manuscript of a missing comedy by Menander, for the buskin worn by Roscius, and for a return check to the theater at Herculaneum, still there are not a few curiosities almost

as curious as these. There is the sword Frederick Lemaître drew in the last act of "*Ruy Blas*." There is the crooked staff whereon Charlotte Cushman leaned as *Meg Merrilies*, when she foretold the fate of *Guy Mannering*. There is the blond wig which M. Fechter chose to wear as *Hamlet*, perhaps the most chattered about of all theatrical wigs; that it is, in reality, red and not at all blond is not surprising to those who have mused on the unrealities of life, as *Hamlet* himself was wont to do. There is a ring that once belonged to David Garrick, and a lock of hair that once belonged to Edmund Kean. There is a spring dagger, formerly the property of Edwin Forrest, the blade of which kindly retired within the hilt when the owner went through the motions of stabbing himself. There is a crucifix used by Signora Ristori in the character of *Sor Teresa*, and a ring of Mrs. Betterton's. Here also are the second, third, and fourth folios of Shakspeare's works, the first folio of Beaumont and Fletcher's, the first folio of Ben Jonson, and the first of Sir William Davenant with an autograph poem. Here are many autographs of high theatrical interest. Here, finally, are certain stately pieces of silver, among them a salver and pitcher presented in 1828 to Junius Brutus Booth and the loving-cup presented to William Warren a few years before he died.

Here and there throughout the house are to be seen Shaksperian mottoes, even in the most unexpected places. That which adorns one of the mantelpieces in the grill-room is, "Mouth it, as many of our Players do." It is into this grill-room that the passage opens which the safes with the relics guard on either hand. The grill-room extends the full width of the house, and it has a broad piazza whereon the tables are set on pleasant summer days that the members may lunch and dine in the open air. This grill-room, with its oaken beams overhead, its high wainscot, its branching silver candelabra skilfully adapted to the electric light, its novel chandelier of silver-mounted stag-horns, its blue tiled fireplaces at either end, its restful vista of a green garden beyond, its framed play-bills, and its many portraits, beneath which the walls are almost hidden, is the most beautiful room in the house and the most original.

It is seen to best advantage on Ladies' Day. The Players have but two annual feasts: one is Founder's Night, when the members assemble on New Year's Eve at midnight in commemoration of the opening of the club on the first day of 1889; and the other is Ladies' Day, when the wives and daughters of members are made welcome; this is on the afternoon of Shakspeare's birthday, the twenty-third of April. Then is the grill-room in its glory, with the fair greenery of spring outside, with deep red roses on every

THE GRILL-ROOM.

table, with the moving groups of the ladies eager for the annual inspection of the paradise from which they are barred on every other day in the year. Such a gathering of beautiful and distinguished women as is seen on Ladies' Day at The Players is a rare sight even in New York.

From the evening when the club-house opened its doors, The Players have been well bestowed. On that first New Year's Eve, though the paint was scarce dry, so delicate had been the taste and so adroit the skill of the decorator, the house had no offensive air of raw newness. It appeared to be mellow from the very beginning; and as the members for the first time entered into their own, they found a fire crackling cheerfully in many a fireplace, pictures peopling the walls, and books ready to the hand, just as though the club had been in existence for years.

The books and a majority of the pictures are in the room which serves as library and as the chief portrait gallery. It is a long room, occupying most of the second floor. The book-cases rise to the height of a man's head and the books are ready to the hand. From the walls above the portraits of the great actors and actresses of the past look down upon their successors of the present. It was the intent of the founder that the home of The Players should be a center of light and a haven of rest for the active members of his profession. Here in the library, with its inviting arm-chairs, and its atmosphere of repose, one may keep the best of good company—that of the silent friends of the past which stand on the shelves on all sides rejecting no advances. It is an oasis where the most active of us may gladly loaf and invite his soul. "There were times," wrote Thoreau recalling his sojourn at Walden, "when I could not afford to sacrifice the bloom of the present moment to any work, whether of the head or of the hands: I love a broad margin to my life."

In the oaken cases which stretch from one fireplace to the other is the private collection of Mr. Booth, the working library of a Shaksperian tragedian. Beyond and between the farther mantelpiece and the rear window is a major part of the theatrical collection of Mr. Lawrence Barrett; and opposite are the dramatic books of the late John Gilbert, a welcome gift from his widow. Other friends have filled most of the other shelves; and the gathering grows apace. Among the treasures, for example, is a collection of some thirty thousand playbills, and over a hundred volumes of original editions of the elder dramatists, presented by Mr. Daly. In a shrine over a cabinet are half a dozen death-masks, from the unequalled collection of Mr. Laurence Hutton; and thus we may see how the author of "The School

for Scandal" looked after he had departed this life, and the author of "Faust," and the author of "The Robbers." There are death-masks also of David Garrick and of Edmund Kean, of Marie Malibran and of Ludwig Devrient, of Boucicault and of Lawrence Barrett, sad memorials of departed beauty, genius, and power.

Above the shelves where the dust settles on their biographies and on the comedies and the tragedies they acted, are the portraits of the players of the past. No other collection of theatrical pictures approaches this in extent or in importance save that of the Garrick Club in London. As the gallery of the Garrick was begun by the purchase of the pictures got together by Charles Matthews, so that of The Players had its germ in the portraits gathered by Mr. John Sleeper Clarke, a comedian who has acted with abundant success more than one of Matthews's characters. To the small collection of his brother-in-law, Mr. Booth added many others; and since the club has opened, and since the fact has become known that it will gladly accept and care for portraits of actors, not a few have been presented, as always happens when the public is aware that gifts of this sort are welcome. The two-score and more portraits in the library are all theatrical in their subjects—except that there is here a picture supposed to be by Rembrandt Peale of George Washington, who, under George III., was the active leader of his majesty's opposition. It was for this painting that Mr. Aldrich suggested the properly theatrical legend, "Our Leading Man."

Among these pictures there are, as all dramatic collectors will be pleased to learn, at least a dozen of the portraits painted by Naegle to be engraved for the Lopez and Wemyss series of plays—Charlotte and John Barnes, for example, Mr. and Mrs. Francis, Mr. and Mrs. Duff, Wilson, Wood, and Kean. There is also a portrait of Kean by Naegle, painted at a single sitting, so the story goes, and under peculiar circumstances. Some admirers of the actor wanted him to sit to the artist for a picture as *Richard III.*, but he refused repeatedly. At last they invited Kean to supper after the play, and made him acquainted with Naegle, to whom he took a fancy before the feast was half over. When urged again to let the artist paint his portrait as the crookback, the actor craftily consented to pose at once, if the painter had his instruments and if he had his costume. Now these necessities were secretly in readiness, Naegle having provided against good fortune, and his friends having bribed Kean's dresser to be in attendance with the royal robes and plumes. So it is that *Richard III.* gazes down on us now a little unsteadily, as though flushed with wine rather than with victory.

It was before this portrait of Kean that Mr. Joseph Jefferson placed himself one evening when he had a night off and wished to rest. He helped himself to a biography of Kean from the shelf, and he settled himself down in an easy chair; and there he read for two hours or more, glancing up now and again from the printed page, where the story of the wayward actor's life was told, to the painted canvas from which the man smiled back in full enjoyment of existence. Down in the grill-room there hangs a broad playbill of Drury Lane Theater announcing that David Garrick would play *Hamlet* on Wednesday, February 10, 1773; and there below the name of Garrick is the name of Mr. Jefferson, who is set down to play *The King*. The Joseph Jefferson who now delights us as *Bob Acres* once pointed with pride to this playbill, and remarked that the Joseph Jefferson who played with Garrick was his great-grandfather.

Among the other portraits in oil which fill the library, and overflow out upon the staircase hall, are those of Charles Mayne Young, Edwin Forrest, Mrs. Nesbit, and James Wallack by Middleton, of Henry Wallack by Inman, of E. S. Connor and R. C. Maywood by Sully, and of John Howard Payne by Wright. In the pri-

vate dining-room, which is on the same floor as the library, there are half a dozen landscapes, two of them being scenes in Louisiana, painted by Mr. Jefferson. From the windows of this private dining-room may be had a grateful glimpse of the grass and the shrubbery of the shaded garden of the Tilden Library next door. "The country is lyric," said Longfellow—"the town dramatic"; and of necessity the theater is urban, but The Players are fortunate in catching a breath of rusticity from Gramercy Park in front, and from the quiet gardens behind. In other respects, the club-house is much like other club-houses; upstairs there are the apartments reserved by the founder and a few chambers which members may occupy, and downstairs there is a billiard-room where an actor may fail to take his cue without fear of derogation. Upstairs and downstairs the home of The Players is seemly and comfortable, restful and satisfactory. It is interesting in itself, and for what it contains, and for those who frequent it. It is a place to delight all who can echo Horace Walpole's assertion: "I do not love great folks till they have pulled off their buskins and put on their slippers; because I do not care sixpence for what they would be thought, but for what they are."

Brander Matthews.

INDIA.

SILENT amidst unbroken silence deep
 Of dateless years, in loneliness supreme,
 She pondered patiently one mighty theme,
 And let the hours, uncounted, by her creep.
 The moveless Himalayas, the broad sweep
 Of glacial cataracts, great Ganges' stream—
 All these to her were but as things that seem,
 Doomed all to pass, like phantoms viewed in sleep.
 Her history? She has none—scarce a name.
 The life she lived is lost in the profound
 Of time, which she despised; but nothing mars
 The memory which, single, gives her fame—
 She dreamed eternal dreams, and from the ground
 Still raised her yearning vision to the stars.

Florence Earle Coates.

THE NAULAHKA.¹

A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

I.

NICHOLAS TARVIN sat in the moonlight on the un-railed bridge that crossed the irrigating-ditch above Topaz, dangling his feet over the stream. A brown, sad-eyed little woman sat beside him, staring quietly at the moon. She was tanned with the tan of the girl who does not mind wind and rain and sun, and her eyes were sad with the settled melancholy of eyes that know big mountains, and seas of plain, and care, and life. The women of the West shade such eyes under their hands at sunset in their cabin doors, scanning those hills or those grassless, treeless plains for the home-coming of their men. A hard life is always hardest for the woman.

Kate Sheriff had lived with her face to the west and with her smoldering eyes fixed upon the wilderness since she could walk. She had advanced into the wilderness with the railroad. Until she had gone away to school she had never lived where the railroad ran both ways. She had often stayed long enough at the end of a section with her family to see the first glimmering streaks of the raw dawn of civilization, usually helped out by the electric light; but in the new and still newer lands to which her father's civil-engineering orders called them from year to year there were not even arc lamps. There was a saloon under a tent, and there was the section-house, where they lived, and where her mother had sometimes taken to board the men employed by her husband. But it was not these influences alone that had produced the young woman of twenty-three who sat near Tarvin, and who had just told him gently that she liked him, but that she had a duty elsewhere.

This duty, as she conceived it, was, briefly, to spend her life in the East in the effort to better the condition of the women of India. It had come to her as an inspiration and a command two years before, toward the end of her second year at the St. Louis school where she went to tie up the loose ends of the education she had given herself in lonely camps.

Kate's mission had been laid on her one

April afternoon warmed and sunned with the first breath of spring. The green trees, the swelling buds, and the sunlight outside had tempted her from the prospect of a lecture on India by a Hindu woman; and it was finally because it was a school duty not to be escaped that she listened to Pundita Ramabai's account of the sad case of her sisters at home. It was a heart-breaking story, and the girls, making the offerings begged of them in strange accents, went from it stilled and awed to the measure of their natures, and talked it over in the corridors in whispers until a nervous giggle broke the tension, and they began chattering again.

Kate made her way from the hall with the fixed, inward-looking eye, the flaming cheek, and air-borne limbs of one on whom the mantle of the Spirit has descended. She went quickly out into the school-garden, away from everybody, and paced the flower-bordered walks, exalted, rich, sure, happy. She had found herself. The flowers knew it, the tender-leaved trees overhead were aware, the shining sky had word. Her head was high; she wanted to dance, and, much more, she wanted to cry. A pulse in her forehead went beat, beat; the warm blood sang through her veins; she stopped every little while to take a deep draft of the good air. In those moments she dedicated herself.

All her life should take breath from this hour; she vowed it to the service this day revealed to her, as once to the prophets—vowed all her strength and mind and heart. The angel of the Lord had laid a command upon her. She obeyed joyfully.

And now after two years spent in fitting herself for her calling she returned to Topaz, a capable and instructed nurse, on fire for her work in India, to find that Tarvin wished her to stay at Topaz and marry him.

"You can call it what you like," Tarvin told her, while she gazed at the moon; "you can call it duty, or you can call it woman's sphere, or you can call it, as that meddling missionary called it at church to-night, 'carrying the light to them that sit in darkness.' I've no doubt you've got a halo to put to it; they've taught you names enough for things in the East. But for me, what I say is, it's a freeze-out."

"Don't say that, Nick. It's a call."

"You've got a call to stay at home; and if you have n't heard of it, I'm a committee to notify you," said Tarvin, doggedly. He shied a pebble into the irrigating-ditch, and eyed the racing current with lowering brows.

"Dear Nick, how can you bear to urge any one who is free to stay at home and shirk after what we've heard to-night?"

"Well, by the holy smoke, some one has got to urge girls to stand by the old machine, these days! You girls are no good at all under the new regulations until you desert. It's the road to honor."

"Desert!" gasped Kate. She turned her eyes on him.

"Well, what do you call it? That's what the little girl I used to know on Section 10 of the N. P. and Y. would have called it. O Kate dear, put yourself back in the old days; remember yourself then, remember what we used to be to each other, and see if you don't see it that way. You've got a father and mother, have n't you? You can't say it's the square thing to give them up. And you've got a man sitting beside you on this bridge who loves you for all he's worth—loves you, you dear old thing, for keeps. You used to like him a little bit too. Eh?"

He slid his arm about her as he spoke, and for a moment she let it rest there.

"Does that mean nothing to you either? Don't you seem to see a call here too, Kate?"

He forced her to turn her face to him, and gazed wistfully into her eyes for a moment. They were brown, and the moonlight deepened their sober depths.

"Do you think you have a claim?" she asked, after a moment.

"I'll think almost anything to keep you. But no; I have n't any claim—or none at least that you are not free to jump. But we all have a claim; hang it, the situation has a claim. If you don't stay, you go back on it. That's what I mean."

"You don't take a serious view of things, Nick," she said, putting down his arm.

Tarvin did n't see the connection; but he said good-humoredly, "Oh, yes, I do! There's no serious view of life I won't take in fun to please you."

"You see—you're not in earnest."

"There's one thing I'm in earnest about," he whispered in her ear.

"Is there?" She turned away her head.

"I can't live without you." He leaned toward her, and added in a lower voice, "Another thing, Kate—I won't."

Kate compressed her lips. She had her own will. They sat on the bridge beating out their difference until they heard the kitchen clock in

a cabin on the other side of the ditch strike eleven. The stream came down out of the mountains that loomed above them; they were half a mile from the town. The stillness and the loneliness closed on Tarvin with a physical grip as Kate got up and said decisively that she must go home. He knew she meant that she must go to India, and his own will crumpled helplessly for the moment within hers. He asked himself whether this was the will by which he earned his living, the will which at twenty-eight had made him a successful man by Topaz standards, which was taking him to the State legislature, and which would one day take him much further, unless what ceased to be what. He shook himself scornfully; but he had to add to himself that after all she was only a girl, if he did love her, before he could stride to her side, as she turned her back on him, and say, "See here, young woman, you're away off!"

She did not answer, but walked on.

"You're not going to throw your life away on this Indian scheme," he pursued. "I won't have it. Your father won't have it. Your mother will kick and scream at it, and I'll be there to encourage her. We have some use for your life, if you have n't. You don't know the size of your contract. The land is n't fit for rats; it's the Bad Lands,—yes; that's just what it is, a great big Bad Lands,—morally, physically, and agriculturally, Bad Lands. It's no place for white men, let alone white women; there's no climate, no government, no drainage; and there's cholera, heat, and fighting until you can't rest. You'll find it all in the Sunday papers. You want to stay right where you are, young lady."

She stopped a moment in the road they were following back to Topaz and glanced at his face in the moonlight. He took her hand, and, for all his masterfulness, awaited her word with parted lips.

"You're a good man, Nick, but"—she drooped her eyes—"I'm going to sail on the 31st for Calcutta."

II.

To sail from New York the 31st she must leave Topaz by the 27th at latest. It was now the 15th. Tarvin made the most of the intervening time. He called on her at her home every evening, and argued it out with her.

Kate listened with the gentlest willingness to be convinced, but with a dread firmness round the corners of her mouth, and with a sad wish to be good to him, if she could, battling in her eyes with a sadder helplessness.

"I'm called," she cried. "I'm called. I can't get away from it. I can't help listening. I can't help going."

And, as she told him, grieving, how the cry of her sisters out of that dim misery, that was yet so distinct, tugged at her heart, how the useless horror and torture of their lives called on her by night and by day, Tarvin could not refuse to respect the solemnly felt need that drew her from him. He could not help begging her in every accent he knew not to harken to it, but the painful pull of the cry she heard was not a strange or incredible thing to his own generous heart. He only urged hotly that there were other cries, and that there were other people to attend to this one. He, too, had a need, the need for her; and she another, if she would stop a moment to listen to it. They needed each other; that was the supreme need. The women in India could wait; they would go over and look them up later, when the Three C.'s had come to Topaz, and he had made his pile. Meanwhile there was happiness; meanwhile there was love. He was ingenious, he was deeply in love, he knew what he wanted, and he found the most persuasive language for making it seem to be what she wanted in disguise. Kate had to strengthen her resolution often in the intervals between his visits. She could not say much in reply. She had no such gift of communicating herself as Tarvin. Hers was the still, deep, voiceless nature that can only feel and act.

She had the kind of pluck and the capacity for silent endurance which goes with such natures, or she must often have faltered and turned back from the resolve which had come upon her in the school-garden that spring day, in the two years that followed it. Her parents were the first obstacle. They refused outright to allow her to study medicine. She had wished to be both physician and nurse, believing that in India she would find use for both callings; but since she could follow only one, she was content to enroll herself as a student at a New York training-school for nurses, and this her parents suffered in the bewilderment of finding that they had forgotten how to oppose her gently resolute will through the lifelong habit of yielding to it.

Her ideas had made her mother wish, when she explained them to her, that she had let her grow up wild, as she had once seemed certain to do. She was even sorry that the child's father had at last found something to do away from the awful railroad. The railroad now ran two ways from Topaz; Kate had returned from school to find the track stretching a hundred miles to the westward, and her family still there. This time the boom had overtaken them before they could get away. Her father had bought city lots in the acre form and was too rich to move. He had given up his calling and had gone into politics.

Sheriff's love for his daughter was qualified by his general flatness; but it was the clinging affection not uncommon with shallow minds, and he had the habit of indulgence toward her which is the portion of an only child. He was accustomed to say that "what she did was about right," he guessed, and he was usually content to let it go at that. He was anxious now that his riches should do her some good, and Kate had not the heart to tell him the ways she had found to make them do her good. To her mother she confided all her plan; to her father she only said that she wished to learn to be a trained nurse. Her mother grieved in secret with the grim, philosophic, almost cheerful hopelessness of women whose lives have taught them always to expect the worst. It was a sore trial to Kate to disappoint her mother, and it cut her to the heart to know that she could not do what both her father and mother expected of her. Indefinite as the expectation was,—it was simply that she should come home and live, and be a young lady, like the rest of the world,—she felt its justice and reason, and she did not weep the less for them because for herself she believed, modestly, that it was ordered otherwise.

This was her first trouble. The dissonance between those holy moments in the garden and the hard prose which was to give them reality and effect grew deeper as she went on. It was daunting, and sometimes it was heart-sickening; but she went forward—not always strong, not every moment brave, and only a very little wise, but always forward.

The life at the training-school was a cruel disillusion. She had not expected the path she had set before her to bloom with ease; but at the end of her first month she could have laughed bitterly at the difference between her consecrating dreams and the fact. The dreams looked to her vocation; the fact took no account of it. She had hoped to befriend misery, to bring help and healing to pain from the first days of her apprenticeship. What she was actually set to do was to scald babies' milk-cans.

Her further duties in these early days were no more nearly related to the functions of a nurse, and looking about her among the other girls to see how they kept their ideals alight in the midst of work so little connected with their future calling, she perceived that they got on for the most part by not having any. As she advanced, and was trusted first with babies themselves, and later with the actual work of nursing, she was made to feel how her own purpose isolated her. The others were here for business. With one or two exceptions they had apparently taken up nursing as they might have taken up dressmaking. They were here to learn how to make twenty dollars a week, and the

sense of this dispirited her even more than the work she was given to do as a preparation for her high calling. The talk of the Arkansas girl who sat on a table and swung her legs while she discussed her flirtations with the young doctors at the clinics seemed in itself sometimes a final discouragement. Through all ran the bad food, the scanty sleep, the insufficient hours for recreation, the cruelly long hours assigned for work, the nervous strain of supporting the life from the merely physical point of view.

In addition to the work which she shared with the others, she was taking regular lessons in Hindustani, and she was constantly grateful for the earlier days which had given her robust health and a sound body. Without them she must often have broken down; and soon it began to be a duty not to break down, because it had become possible to help suffering a little. It was this which reconciled her finally to the low and sordid conditions under which the whole affair of her preparation went on.

The repulsive aspects of the nursing itself she did not mind. On the contrary she found herself liking them as she got into the swing of her work; and when, at the end of her first year, she was placed in charge of a ward at the woman's hospital, under another nurse, she began to feel herself drawing in sight of her purpose, and kindled with an interest which made even the surgical operations seem good to her because they helped, and because they allowed her to help a little.

From this time she went on working strongly and efficiently toward her end. Above all she wanted to be competent, to be wise and thorough. When the time came when those helpless, walled-up women should have no knowledge and no comfort to lean on but hers, she meant that they should lean on the strength of solid intelligence. Her trials were many, but it was her consolation in the midst of them all that her women loved her, and lived upon her comings and goings. Her devotion to her purpose carried her forward. She was presently in full charge, and in that long, bare ward where she strengthened so many sufferers for the last parting, where she lived with death and dealt with it, where she went about softly, soothing unspeakable pain, learning the note of human anguish, hearing no sound but the murmur of suffering or relief, she sounded one night the depths of her own nature, and received from an inward monitor the confirmation of her mission. She consecrated herself to it afresh with a joy beyond her first joy of discovery.

And now every night at half-past eight Tarvin's hat hung on the hat-rack in the hallway of her home. He removed it gloomily at a little after eleven, spending the interval in talking over her mission with her persuasively, com-

mandingly, imploringly, indignantly. His indignation was for her plan, but it would sometimes irrepressibly transfer itself to Kate. She was capable not only of defending her plan but of defending herself and keeping her temper; and as this last was an art beyond Nick, these sessions often came to an end suddenly, and early in the evening. But the next night he would come and sit before her in penitence, and with his elbows on his knees, and his head supported moodily in his hands, would entreat her submissively to have some sense. This never lasted long, and evenings of this kind usually ended in his trying to pound sense into her by hammering his chair-arm with a convinced fist.

No tenderness could leave Tarvin without the need to try to make others believe as he did; but it was a good-humored need, and Kate did not dislike it. She liked so many things about him that often as they sat thus, facing each other, she let her fancy wander where it had wandered in her school-girl vacations—in a possible future spent by his side. She brought her fancy back again sharply. She had other things to think of now; but there must always be something between her and Tarvin different from her relation to any other man. They had lived in the same house on the prairie at the end of the section, and had risen to take up the same desolate life together morning after morning. The sun brought the morning grayly up over the sad gray plain, and at night left them alone together in the midst of the terrible spaces of silence. They broke the ice together in the muddy river near the section-house, and Tarvin carried her pail back for her. A score of other men lived under the same roof, but it was Tarvin who was kind. The others ran to do what she asked them to do; Tarvin found things to do, and did them while she slept. There was plenty to do. Her mother had a family of twenty-five, twenty of whom were boarders—the men working in one capacity or another directly under Sheriff. The hands engaged in the actual work of building the railroad lived in huge barracks near by, or in temporary cabins or tents. The Sheriffs had a house; that is, they lived in a structure with projecting eaves, windows that could be raised or lowered, and a veranda. But this was the sum of their conveniences, and the mother and daughter did their work alone, with the assistance of two Swedes whose muscles were firm but whose cookery was vague.

Tarvin helped her, and she learned to lean on him; she let him help her, and Tarvin loved her for it. The bond of work shared, of a mutual dependence, of isolation, drew them to each other; and when Kate left the section-house for school there was a tacit understanding between

them. The essence of such an understanding of course lies in the woman's recognition of it. When she came back from school for the first holiday, Kate's manner did not deny her obligation, but did not confirm the understanding, and Tarvin, restless and insistent as he was about other things, did not like to force his claim upon her. It was n't a claim he could take into court.

This kind of forbearance was well enough while he expected to have her always within reach, while he imagined for her the ordinary future of an unmarried girl. But when she said she was going to India she changed the case. He was not thinking of courtesy or forbearance, or of the propriety of waiting to be formally accepted, as he talked to her on the bridge, and afterward in the evenings. He ached with his need for her, and with the desire to keep her.

But it looked as if she were going—going in spite of everything he could say, in spite of his love. He had made her believe in that, if it was any comfort; and it was real enough to her to hurt her, which *was* a comfort!

Meanwhile she was costing him much in one way and another, and she liked him well enough to have a conscience about it. But when she would tell him that he must not waste so much time and thought on her, he would ask her not to bother her little head about him: he saw more in her than he did in real estate or politics just then; he knew what he was about.

"I know," returned Kate. "But you forget what a delicate position you put me in. I don't want to be responsible for your defeat. Your party will say I planned it."

Tarvin made a positive and unguarded remark about his party, to which Kate replied that if he did n't care she must; she could n't have it said, after the election, that he had neglected his canvass for her, and that her father had won his seat in consequence.

"Of course," she added frankly, "I want father to go to the State legislature, and I don't want you to go, because if you win the election, he can't; but I don't want to help prevent you from getting in."

"Don't worry about your father getting that seat, young lady," cried Tarvin. "If that's all you've got to lie awake about, you can sleep from now until the Three C.'s comes to Topaz. I'm going to Denver myself this fall, and you'd better make your plans to come along. Come! How would it suit you to be the speaker's wife, and live on Capitol Hill?"

Kate liked him well enough to go half credulously with him in his customary assumption that the difference between his having anything he wanted and his not having it was the differ-

ence between his wanting it and his not wanting it.

"Nick!" she exclaimed, deriding, but doubtful, "you won't be speaker!"

"I'd undertake to be governor, if I thought the idea would fetch you. Give me a word of hope, and you'll see what I'd do."

"No, no!" she said, shaking her head. "My governors are all rajahs, and they live a long way from here."

"But say, India's half the size of the United States. Which State are you going to?"

"Which —?"

"Ward, township, county, section? What's your post-office address?"

"Rhatore, in the province of Gokral Seetaran, Rajputana, India."

"All that!" he repeated despairingly. There was a horrible definiteness about it; it almost made him believe she was going. He saw her drifting hopelessly out of his life into a land on the nether rim of the world, named out of the Arabian Nights, and probably populated out of them. "Nonsense, Kate! You're not going to try to live in any such heathen fairyland. What's it got to do with Topaz, Kate? What's it got to do with home? You can't do it, I tell you. Let them nurse themselves. Leave it to them. Or leave it to me. I'll go over myself, turn some of their pagan jewels into money, and organize a nursing corps on a plan that you shall dictate. Then we'll be married, and I'll take you out to look at my work. I'll make a go of it. Don't say they're poor. That necklace alone would fetch money enough to organize an army of nurses. If your missionary told the truth in his sermon at church the other night, it would pay the national debt. Diamonds the size of hens' eggs, yokes of pearls, coils of sapphires the girth of a man's wrist, and emeralds until you can't rest—and they hang all that around the neck of an idol, or keep it stored in a temple, and call on decent white girls to come out and help nurse them! It's what I call cheek."

"As if money could help them! It's not that. There's no charity or kindness or pity in money, Nick; the only real help is to give yourself."

"All right. Then give me too. I'll go along," he said, returning to the safer humorous view.

She laughed, but stopped herself suddenly. "You must n't come to India, Nick. You won't do that. You won't follow me. You sha'n't."

"Well, if I get a place as rajah, I don't say I would n't. There might be a dollar in it."

"Nick! They would n't let an American be a rajah."

It is strange that men to whom life is a joke find comfort in women to whom it is a prayer.

"They might let him *run* a rajah, though," said Tarvin, undisturbed; "and it might be the softer snap. Rajahing itself is classed extra-hazardous, I think."

"How?"

"By the accident insurance companies—double premium. None of *my* companies would touch the risk. They might take a vizier though," he added meditatively. "They come from that Arabian Nights section, don't they?"

"Well, you are not to come," she said definitively. "You must keep away. Remember that."

Tarvin got up suddenly. "Oh, good night! Good night!" he cried.

He shook himself together impatiently, and waved her from him with a parting gesture of rejection and cancelation. She followed him into the passage, where he was gloomily taking his hat from its wonted peg; but he would not even let her help him on with his coat.

No man can successfully conduct a love-affair and a political canvass at the same time. It was perhaps the perception of this fact that had led Sheriff to bend an approving eye on the attentions which his opponent in the coming election had lately been paying his daughter. Tarvin had always been interested in Kate, but not so consecutively and intensely. Sheriff was stumping the district, and was seldom at home, but in his irregular appearances at Topaz he smiled stolidly on his rival's occupation. In looking forward to an easy victory over him in the joint debate at Cañon City, however, he had perhaps relied too much on the younger man's absorption. Tarvin's consciousness that he had not been playing his party fair had lately chafed against his pride of success. The result was irritation, and Kate's prophecies and insinuations were pepper on an open wound.

The Cañon City meeting was set down for the night following the conversation just recorded, and Tarvin set foot on the shaky dry-goods-box platform at the roller skating-rink that night with a raging young intention to make it understood that he was still here, if he *was* in love.

Sheriff had the opening, and Tarvin sat in the background dangling a long, restless leg from one knee. The patchily illumined huddle of auditors below him looked up at a nervous, bony, loose-hung man, with a kind, clever, aggressive eye, and a masterful chin. His nose was prominent, and he had the furrowed forehead and the hair thinned about the temples which come to young men in the West. The alert, acute glance which went roving about the hall, measuring the audience to which he

was to speak, had the look of sufficiency to the next need, whatever it might be, which, perhaps, more than anything else, commends men to other men beyond the Mississippi. He was dressed in the short sack-coat which is good enough for most western public functions; but he had left at Topaz the flannel of every-day wear, and was clad in the white linen of civilization.

He was wondering, as he listened to Sheriff, how a father could have the heart to get off false views on silver and the tariff to this crowd while his daughter was hatching that ghastly business at home. The true views were so much mixed up in his own mind with Kate, that when he himself rose at last to answer Sheriff, he found it hard not to ask how the deuce a man expected an intelligent mass-meeting to accept the political economy he was trying to apply to the government of a State, when he could n't so much as run his own family? Why in the world did n't he stop his daughter from making such a hash of her life?—that was what he wanted to know. What were fathers for? He reserved these apt remarks, and launched instead upon a flood of figures, facts, and arguments.

Tarvin had precisely the gift by which the stump orator coils himself into the heart of the stump auditor: he upbraided, he arraigned; he pleaded, insisted, denounced; he raised his lean, long arms, and called the gods and the statistics and the Republican party to witness, and, when he could make a point that way, he did not scorn to tell a story. "Why," he would cry defiantly in that colloquial shout which the political orator uses for his anecdotes, "that is like a man I used to know back in Wisconsin, who—" It was n't very much like the man in Wisconsin, and Tarvin had never been in Wisconsin, and did n't know the man; but it was a good story, and when the crowd howled with delight Sheriff gathered himself together a little and tried to smile, and that was what Tarvin wanted.

There were dissentient voices, and the jointness of the debate was sometimes not confined to the platform; but the deep, relishing groans which would often follow applause or laughter acted as a spur to Tarvin, who had joined the janitor of the rink that afternoon in mixing the dusky brew on the table before him, and who really did not need a spur. Under the inspiration of the mixture in the pitcher, the passionate resolve in his heart, and the groans and hisses, he melted gradually into an ecstasy of conviction which surprised even himself, and he began to feel at last that he had his audience under his hand. Then he gripped them, raised them aloft like a conjuror, patted and stroked them, dropped them to dreadful depths, snatched

them back, to show that he could, caught them to his heart, and told them a story. And with that audience hugged to his breast he marched victoriously up and down upon the prostrate body of the Democratic party, chanting its requiem. It was a great time. Everybody rose at the end and said so loudly; they stood on benches and shouted it with a bellow that shook the building. They tossed their caps in the air, and danced on one another, and wanted to carry Tarvin around the hall on their shoulders.

But Tarvin, with a choking at the throat, turned his back on it all, and, fighting his way blindly through the crowd which had gathered on the platform, reached the dressing-room behind the stage. He shut and bolted the door behind him, and flung himself into a chair, mopping his forehead.

"And the man who can do that," he muttered, "can't make one tiny little bit of a girl marry him."

III.

It was an opinion not concealed in Cañon City the next morning that Tarvin had wiped up the floor with his adversary; and it was at least definitely on record, as a result of Tarvin's speech, that when Sheriff rose half-heartedly to make the rejoinder set down for him on the program, he had been howled back into his seat by a united public opinion. But Sheriff met Tarvin at the railway-station where they were both to take the train for Topaz with a fair imitation of a nod and smile, and certainly showed no inclination to avoid him on the journey up. If Tarvin had really done Kate's father the office attributed to him by the voice of Cañon City, Sheriff did not seem to be greatly disturbed by the fact. But Tarvin reflected that Sheriff had balancing grounds of consolation—a reflection which led him to make the further one that he had made a fool of himself. He had indeed had the satisfaction of explaining publicly to the rival candidate which was the better man, and had enjoyed the pleasure of proving to his constituents that he was still a force to be reckoned with, in spite of the mad missionary notion which had built a nest in a certain young woman's head. But how did that bring him nearer Kate? Had it not rather, so far as her father could influence the matter, put him farther away—as far as it had brought his own election near. He believed he would be elected now. But to what? Even the speakership he had dangled before her did not seem so remote in the light of last night's occurrences. But the only speakership that Tarvin cared to be elected to was the speakership of Kate's heart.

He feared he should n't be chosen to fill that high office immediately, and as he glanced

at the stumpy, sturdy form standing next him on the edge of the track, he knew whom he had to thank. She would never go to India if she had a man for a father like some men he knew. But a smooth, politic, conciliating, selfish, easy-going rich man—what could you expect? Tarvin could have forgiven Sheriff's smoothness if it had been backed by force. But he had his opinion of a man who had become rich by accident in a town like Topaz.

Sheriff presented the spectacle, intolerable to Tarvin, of a man who had become bewilderingly well-to-do through no fault of his own, and who now wandered vaguely about in his good fortune, seeking anxiously to avoid giving offense. In his politics he carried this far, and he was a treasury of delight just at this time to the committees of railroad engineers' balls, Knight Templars' excursions, and twilight coteries, and to the organizers of church bazaars, theatricals, and oyster suppers, who had tickets to sell. He went indiscriminately to the oyster suppers and bazaars of all denominations in Topaz, and made Kate and her mother go with him, and his collection of Baptist dolls, Presbyterian embroidery, and Roman Catholic sofa-pillows and spatter-work filled his parlor at home.

But his universal good nature was not so popular as it deserved to be. The twilight coteries took his money but kept their opinion of him; and Tarvin, as the opposing candidate, had shown what he thought of his rival's system of politics by openly declining to buy a single ticket. This feeble-foolish wish to please everybody was, he understood very well, at the root of Sheriff's attitude toward his daughter's mania. Kitty wanted to go so bad he supposed he'd better let her was his slouching version of the situation at home. He declared that he had opposed the idea strongly when she had first suggested it, and Tarvin did not doubt that Sheriff, who he knew was fond of her, had really done what he could. His complaint against him was not on the score of disposition but of capacity. He recognized, however, that this was finally a complaint, like all his others, against Kate; for it was Kate's will which made all pleadings vain.

When the train for Topaz arrived at the station, Sheriff and Tarvin got into the drawing-room car together. Tarvin did not yearn to talk to Sheriff on the way to Topaz, but neither did he wish to seem to shirk conversation. Sheriff offered him a cigar in the smoking-room of the Pullman, and when Dave Lewis, the conductor came through, Tarvin hailed him as an old friend, and made him come back and join them when he had gone his rounds. Tarvin liked Lewis in the way that he liked the thousand other casual acquaintances in the

State with whom he was popular, and his invitation was not altogether a device for avoiding private talk with Sheriff. The conductor told them that he had the president of the Three C.'s on behind in a special car, with his party.

"No!" exclaimed Tarvin, and begged him to introduce him on the spot; he was precisely the man he wanted to see. The conductor laughed, and said he was n't a director of the road—not himself; but when he had left them to go about his duties he came back, after a time, to say that the president had been asking whom he could recommend at Topaz as a fair-minded and public-spirited man, able to discuss in a reasonable spirit the question of the Three C.'s coming to Topaz. The conductor told him that he had two such gentlemen on board his train at that moment, and the president sent word to them by him that he would be glad to have a little talk with them if they would come back to his car.

For a year the directorate of the Three C.'s had been talking of running their line through Topaz, in the dispassionate and impartial manner of directorates which await encouragement. The board of trade at Topaz had promptly met and voted the encouragement. It took the shape of town bonds and gifts of land, and finally of an undertaking to purchase shares of stock in the road itself, at an inflated price. This was handsome even for a board of trade, but under the prick of town ambition and town pride Rustler had done better. Rustler lay fifteen miles from Topaz, up in the mountains, and by that much nearer the mines; and Topaz recognized it as its rival in other matters than that of the Three C.'s.

The two towns had enjoyed their boom at about the same time; then the boom had left Rustler and had betaken itself to Topaz. This had cost Rustler a number of citizens, who moved to the more prosperous place. Some of the citizens took their houses up bodily, loaded them on a flat car, and sent them over to Topaz as freight, to the desolation of the remaining inhabitants of Rustler. But Topaz now began in her turn to feel that she was losing her clutch. A house or two had been moved back. It was Rustler this time which was gaining. If the railroad went there, Topaz was lost. If Topaz secured the railroad, the town was made. The two towns hated each other as such towns hate in the West—malignantly, viciously, joyously. If a convulsion of nature had obliterated one town, the other must have died from sheer lack of interest in life. If Topaz could have killed Rustler, or if Rustler could have killed Topaz, by more enterprise, push, and go, or by the lightnings of the local press, the surviving town would have organized a triumphal procession

and a dance of victory. But the destruction of the other town by any other than the heaven-appointed means of schemes, rustle, and a board of trade would have been a poignant grief to the survivor.

The most precious possession of a citizen of the West is his town pride. It is the flower of that pride to hate the rival town. Town pride cannot exist without town jealousy, and it was therefore fortunate that Topaz and Rustler lay within convenient hating distance of each other, for this living belief of men in the one spot of all the great western wilderness on which they have chosen to pitch their tents contains within itself the future and the promise of the West.

Tarvin cherished this sentiment as a religion. It was nearer to him than anything in the world but Kate, and sometimes it was even nearer than Kate. It did duty with him for all the higher aspirations and ideals which beckon other men. He wished to succeed, he wished to make a figure, but his best wish for himself was one with his best wish for the town. He could not succeed if the town failed; and if the town prospered he must prosper. His ambition for Topaz, his glory in Topaz, were a patriotism—passionate and personal. Topaz was his country; and because it was near and real, because he could put his hand on it, and, above all, because he could buy and sell pieces of it, it was much more recognizably his country than the United States of America, which was his country in time of war.

He had been present at the birth of Topaz. He had known it when his arms could almost encircle it; he had watched and fondled and caressed it; he had pegged down his heart with the first peg of the survey; and now he knew what was good for it. It wanted the Three C.'s.

The conductor presented Tarvin and Sheriff to the president when he had led them back to his private car, and the president made them both known to his young wife,—a blonde of twenty-five, consciously pretty and conspicuously bridal,—by whose side Tarvin placed himself with his instant perception. There were apartments in the private car before and beyond the drawing-room into which they had been shown. The whole was a miracle of compactness and convenience; the decoration was of a specious refinement. In the drawing-room was a smother of plushes in hues of no kindred, a flicker of tortured nickel-work, and a flash of mirrors. The studied soberness of the wood-work, in a more modern taste, heightened the high pitch of the rest.

The president of the embryo Colorado and California Central made room for Sheriff in one of the movable wicker chairs by tilting out

a heap of illustrated papers, and bent two beady black eyes on him from under a pair of bushy eyebrows. His own bulk filled and overflowed another of the frail chairs. He had the mottled cheeks and the flaccid fullness of chin of a man of fifty who has lived too well. He listened to the animated representations which Sheriff at once began making him with an irresponsible, sullen face, while Tarvin engaged Mrs. Mutrie in a conversation which did not imply the existence of railways. He knew all about the marriage of the president of the Three C.'s, and he found her very willing to let him use his knowledge flatteringly. He made her his compliments; he beguiled her into telling him about her wedding journey. They were just at the end of it; they were to settle in Denver. She wondered how she should like it. Tarvin told her how she would like it. He guaranteed Denver; he gilded and graced it for her; he made it the city of a dream, and peopled it out of an Eastern fairy tale. Then he praised the stores and the theaters. He said they beat New York, but she ought to see their theater at Topaz. He hoped they meant to stay over a day or two at Topaz.

Tarvin would not praise Topaz crudely, as he praised Denver. He contrived to intimate its unique charm, and when he had managed to make her see it in fancy as the prettiest, and finest, and most prosperous town in the West, he left the subject. But most of their subjects were more personal, and while he discussed them with her he pushed out experimentally in one direction and another, first for a chord of sympathy, then for her weak point. He wanted to know how she could be reached. *That* was the way to reach the president. He had perceived it as soon as he entered the car. He knew her history, and had even known her father, who had once kept the hotel where he stayed when he went to Omaha. He asked her about the old house, and the changes of proprietorship since he had been there. Who had it now? He hoped they had kept the head waiter. And the cook? It made his mouth water to think of that cook. She laughed with instant sociability. Her childhood had been passed about the hotel. She had played in the halls and corridors, drummed on the parlor piano, and consumed candy in the office. She knew that cook—knew him personally. He had given her custards to take to bed with her. Oh, yes, *he* was still there.

There was an infectious quality in Tarvin's open and friendly manner, in his willingness to be amused, and in his lively willingness to contribute to the current stock of amusement, and there was something endearing in his hearty, manly way, his confident, joyous air, his manner of taking life strongly, and richly,

and happily. He had an impartial kindness for the human species. He was own cousin to the race, and own brother to the members of it he knew, when they would let him be.

He and Mrs. Mutrie were shortly on beautiful terms, and she made him come back with her to the bow-window at the end of the car, and point out the show sights of the Grand Cañon of the Arkansas to her. Theirs was the rearmost carriage, and they looked back through the polished sweep of glass in which the president's car terminated, at the twisting streak of the receding track, and the awful walls of towering rock between which it found its way. They stooped to the floor to catch sight of the massy heights that hung above them, and peered back at the soaring chaos of rock which, having opened to let them through, closed again immitigably as they left it behind. The train went racketing profanely through the tumbled beauty of this primeval world, miraculously keeping a foothold on the knife-edge of space won for it at the bottom of the cañon from the river on one side and from the rock on the other. Mrs. Mutrie would sometimes lose her balance as the train swept them around the ceaseless curves, and only saved herself by snatching at Tarvin. It ended in his making her take his arm, and then they stood and rocked together with the motion of the train, Tarvin steadying their position with outstretched legs, while they gazed up at the monster spires and sovereign hills of stone wavering and dizzying over their heads.

Mrs. Mutrie gave frequent utterance to little exclamations of wonder and applause, which began by being the appropriate feminine response to great expressions of nature, and ended in an awed murmur. Her light nature was controlled and subdued by the spectacle as it might have been silenced by the presence of death; she used her little arts and coqueries on Tarvin mechanically and half-heartedly until they were finally out of the cañon, when she gave a gasp of relief, and, taking petulant possession of him, made him return with her to the chairs they had left in the drawing-room. Sheriff was still pouring the story of the advantages of Topaz into the unattending ear of the president, whose eyes were on the window-pane. Mutrie received her pat on the back and her whispered confidence with the air of an embarrassed ogre. She flounced into her former seat, and commanded Tarvin to amuse her; and Tarvin willingly told her of a prospecting expedition he had once made into the country above the cañon. He had n't found what he was looking for, which was silver, but he had found some rather uncommon amethysts.

"Oh, you don't mean it! You delightful

man! Amethysts! Real live ones? I did n't know they found amethysts in Colorado."

A singular light kindled in her eyes, a light of passion and longing. Tarvin fastened on the look instantly. Was *that* her weak point? If it was — He was full of learning about precious stones. Were they not part of the natural resources of the country about Topaz? He could talk precious stones with her until the cows came home. But would that bring the Three C.'s to Topaz? A wild notion of working complimentary bridal resolutions and an appropriation for a diamond tiara through the board of trade danced through his head, and was dismissed. No public offerings of that kind would help Topaz. This was a case for private diplomacy, for subtle and laborious delicacies, for quiet and friendly manipulation, for the tact of finger-tips,—a touch here, a touch there, and then a grip,—a case, in fine, for Nicholas Tarvin, and for no one else on top of earth. He saw himself bringing the Three C.'s splendidly, royally, unexpectedly into Topaz, and fixing it there by that same Tarvin's unaided strength; he saw himself the founder of the future of the town he loved. He saw Rustler in the dust, and the owner of a certain twenty-acre plot a millionaire.

His fancy dwelt affectionately for a moment on the twenty-acre plot; the money with which he had bought it had not come easily, and business in the last analysis was always business. But the plot, and his plan of selling a portion of it to the Three C.'s for a round-house, when the railway came, and disposing of the rest as town lots by the front foot, were minor chords in the larger harmony. His dream was of Topaz. If promoters, in accord with the high plan of providence, usually came in on the ground floor when their plans went right, that was a fact strictly by the way.

He noticed now, as he glanced at Mrs. Mutrie's hands, that she wore unusual rings. They were not numerous, but the stones were superb. He ventured to admire the huge solitaire she wore on her left hand, and, as they fell into a talk about jewels, she drew it off to let him see it. She said the diamond had a history. Her father had bought it from an actor, a tragedian who had met bad business at Omaha, after playing to empty houses at Denver, Topeka, Kansas City, and St. Jo. The money had paid the fares of the company home to New York, a fact which connected the stone with the only real good it had ever done its various owners. The tragedian had won it from a gambler who had killed his man in a quarrel over it; the man who had died for it had bought it at a low price from the absconding clerk of a diamond merchant.

"It ought to have been smuggled out of the

mines by the man who found it at Kimberly, or somewhere, and sold to an I. D. B.," she said, "to make the story complete. Don't you think so, Mr. Tarvin?"

She asked all her questions with an arch of the eyebrow, and an engaging smile which required the affirmative readily furnished by Tarvin. He would have assented to an hypothesis denying virtue to the discoveries of Galileo and Newton if Mrs. Mutrie had broached it just then. He sat tense and rigid, full of his notion, watching, waiting, like a dog on the scent.

"I look into it sometimes to see if I can't find a picture of the crimes it has seen," she said. "They're so nice and shivery, don't you think so, Mr. Tarvin, particularly the murder? But what I like best about it is the stone itself. It *is* a beauty, is n't it? Pa used to say it was the handsomest he'd ever seen, and in a hotel you see lots of good diamonds, you know." She gazed a moment affectionately into the liquid depths of the brilliant. "Oh, there's nothing like a beautiful stone—nothing!" she breathed. Her eyes kindled. He heard for the first time in her voice the ring of absolute sincerity and unconsciousness. "I could look at a perfect jewel forever, and I don't much care what it is, so it *is* perfect. Pa used to know how I loved stones, and he was always trading them with the people who came to the house. Drummers are great fellows for jewelry, you know, but they don't always know a good stone from a bad one. Pa used to make some good trades," she said, pursing her pretty lips meditatively; "but he would never take anything but the best, and then he would trade that, if he could, for something better. He would always give two or three stones with the least flaw in them for one real good one. He knew they were the only ones I cared for. Oh, I do love them! They're better than folks. They're always there, and always just so beautiful."

"I think I know a necklace you'd like, if you care for such things," said Tarvin, quietly.

"Do you?" she beamed. "Oh, where?"

"A long way from here."

"Oh—*Tiffany's*!" she exclaimed scornfully.

"I know you!" she added, with resumed art of intonation.

"No; further."

"Where?"

"India."

She stared at him a moment interestedly. "Tell me what it's like," she said. Her whole attitude and accent were changed again. There was plainly one subject on which she could be serious. "Is it really good?"

"It's the best," said Tarvin, and stopped.

"Well!" she exclaimed. "Don't tantalize me. What is it made of?"

"Oh, diamonds, pearls, rubies, opals, turquoises, amethysts, sapphires—a rope of them. The rubies are as big as your fist; the diamonds are the size of hens' eggs. It's worth a king's ransom."

She caught her breath. Then after a long moment, "Oh!" she sighed; and then, "Oh!" she murmured again, languorously, wonderingly, longingly. "And where is it?" she asked briskly, of a sudden.

"Round the neck of an idol in the province

(To be continued.)

of Rajputana. Do you want it?" he asked grimly.

She laughed. "Yes," she answered.

"I'll get it for you," said Tarvin, simply.

"Yes, you will!" pouted she.

"I will," repeated Tarvin.

She threw back her gay blonde head and laughed to the painted Cupids on the ceiling of the car. She always threw back her head when she laughed; it showed her throat.

SURSUM CORDA.

UP and rejoice, and know thou hast matter for revel, my heart!
Up and rejoice, not heeding if drawn or undrawn be the dart
Last winged by the Archer whose quiver is full for sweeter than thou,
That yet will sing out of the dust when the ultimate arrow shall bow.

Sing thou! for now thou mayst sing, though slender thy note were, and harsh;
Sing as but once sings the swan borne down the loved stream of his marsh!
In this thou hast matter for revel,—that, sick and undone as thou wast
(Thy wit and thy will in curious mazes frustrate and lost),
Emerged art thou now, neither darkling, nor blinded by fullness of light;
Struck through are the fetters of law by a Freedom unseen, in the height.

Now thou couldst laugh, nor thy laughter with sinister burden be fraught;
Now thou couldst weep where once were the eye-strings tensioned with drought;
Now thou couldst bless and God-speed, without bitterness bred in thine heart,
Loves, that, outworn and time-wasted, were fain from thy lodge to depart:
Though dulled by their passing, thy faith, like a flower upfolded by night,
New kindness should quicken again, as a flower feels the touch of new light.
Ay, now thou couldst love, undefeated, with ardor instinct from pure Love,—
Warmed from a sun in the heavens that knows not beneath nor above,
Nor distance its patience to weary, nor substance unpierced by its ray,
Though world-shadows utter abroad the figment of night and of day!
So should not error and evil enchain thee a mourner for aye;
Now couldst thou pity, and smile, where once but the scourge thou wouldst lay;
Now to thyself couldst show mercy, and up from all penance arise,
Knowing there runneth abroad a chastening flame from the skies.

Doubt not thou hast matter for revel, for once thou wouldst cage thee in steel,
And, wounded, wouldst seek out the balm and the cordial cunning to heal;
But now thou hast knowledge more sovran, more kind, than leech-craft can wield:
Never Design sent thee forth to be safe from the scath of the field,
But bade thee stand bare in the midst, and offer free way to all scath
Piercing thee inly—so only might Song have an outgoing path.
And now thou couldst sing—not as once, in one voice, an iterant strain,
But sounding all measures organic, unstinted of pleasure or pain!
Thou fearest no more, avoidest no more, a fiat decreed,
Nor hopest thou fearingly, reaching forth impotent hands for thy meed.
Now thou couldst love—couldst sing—holding measureless cheer in thy gift,
For such as ungirded and baffled sit down 'mid Time's wreckage and drift.

But now 't is not thine to bestow, to abide, or be known in thy place;
Withdraweth the voice into silence, dissolveth the form and the face.
Death—Life thou discernest! Enlarged as thou art, thy ground thou must shift!
Love over-liveth.—Throb thou forth quickly.—Heart, be uplift!

Edith M. Thomas.

WHAT ARE AMERICANS DOING IN ART?

BY THE VICE-PRESIDENT OF THE NATIONAL ACADEMY OF DESIGN.

THIS question arises naturally from the one so often asked and more or less satisfactorily answered: "What are we doing for art?" It is not easy to give a definite reply to the first question without considering them both together. We may, without prejudice, date back the present revival of art interest in this country to the Philadelphia Exhibition of 1876. First, the extensive and important collection of representative works of art from all countries had a wonderful influence on the public no less than on the artists; secondly, about that time an unusual number of young painters and sculptors returned home after years of study abroad, and established schools and societies, and initiated a movement in art which has since become widespread and popular. At that period there were but two or three art schools of any importance in the country. Even Boston, large as it was, gave no better advantages to an art student than those afforded by the Lowell Institute, where a model was posed one evening in the week for young artists to draw from without instruction. A course of study abroad was open only to those who had private means of their own, or who could rely on the assistance of friends. Europe was, as it is now, the Mecca of young artists, but in the majority of cases the aspirant for European training was obliged to spend the most impressionable years of his life in earning sufficient money to enable him to pass a certain time in the French or German art schools. We doubtless owe to the difficulties of early training much of the impulse which has urged our artists to persist in the effort to establish art schools, but, on the other hand, who shall number the geniuses whose lamps have flickered and gone out in the atmosphere of what Mr. Howells calls "belated puritanism," hostile to art, hostile to sentiment, hostile to all imaginative production?

In the consideration of the status of our art we must recognize first the popular impression that our best artists are disloyal to American art because they do not draw their inspiration from motives to be found within our political

boundaries. There is a species of patriotic glamour which invests the phrase "American art" with an importance and with possibilities which surely do not exist in this cosmopolitan age. It is a favorite theory with those who make art a study without practising it that an American artist should treat American subjects. They forget that the majority of European artists who have made fame and fortune have sought their subjects outside the bounds of their own nationalities. They ignore the fact that the true elements of art which make it characteristic of a people, and therefore a national art, are found, not in the subject, but in the mind of the artist himself. Also, we have to take note of the growing confidence in the powers of our temporarily expatriated artists, and in the belief that, if these same men would pursue their profession at home, their artistic impulses would remain as keen and their enthusiasm continue without a check. The success of our artists in the exhibitions abroad appears to prove that, if we can successfully compete with foreign artists in their own field, we can retransplant these young trees into our own soil and confidently expect them to grow into sturdy oaks and elms. Experience, however, shows us that the contrary is most often the case. It is a discouraging fact that few of those whose names have been prominent among the promising young artists abroad have kept up the high standard of excellence, much less have continued to make progress, after a short season at home. What is the nature of the blight that attacks them, and is there any antidote for this insidious poison that destroys the germs of progress?

To answer these questions we must eliminate from this complex situation all elements of patriotism, and look upon our artists as forming a notable proportion of the great body of men who are to-day wooing the fickle goddess the world over. We may well be gratified with our position in modern art, it is true, but we must confess that we are as yet but in the second stage of artistic growth. It is beyond dispute that individuality marks the highest point of development in art, and is notably present only when there is a high standard of technical excellence. The artist who is so far a master of his materials that, in being able to forget the mechanical operations of execution, he is best prepared to work out his

own individuality, is the result of a succession of steps in art education, a result not accomplished by short methods nor without great personal sacrifice and persistent effort. Primitive art, on the other hand, however much it may be the embodiment of distinctly artistic ideas, is never so free from traditions and limitations of methods that the individual stands out in distinguished preëminence. There is no royal road to good art. The intermediate stages between the crude first attempts and the finished productions are necessarily devoted to the study of means and methods, to the drudgery and mechanics of the profession. These stages are marked, in general terms, by the temporary bewilderment of the artist, and by the apparent annihilation of the highest qualities of the artistic impulse.

This system of growth is true of the community as it is of the individual. When, after the Philadelphia Exhibition, we began to see art schools springing up all over the country, and art museums rising on foundations laid out with regard to the possibilities of the future, we hailed this new spirit, and welcomed this contagious enthusiasm for art as a sure promise of the speedy development of a large and well-equipped body of artists, whose importance in the world of art would be commensurate with our national rank in the world of modern science and commerce. Fifteen years have elapsed, a new generation of artists has sprung up, having had at home facilities for rudimentary education quite as efficient as any to be found abroad. They have sought more advanced instruction in the schools of Europe; they have been recognized there as among the most capable and most promising of pupils; they have taken prizes in the classes, medals in the exhibitions, and have, in general, more than fulfilled all that was expected of them. Many of them have come home again, and are teaching in their turn in the art schools. Of those who have remained abroad many have European reputations.

But the verdict of the world has been often given, and is always the same — namely, that the works by American artists as they are seen in the foreign exhibitions cannot be distinguished from those of their masters and associates; that, indeed, we are still in that stage of artistic development in which the highest acquirement is ability to execute with distinguished skill in the methods of others, and which is still in the leading-reins of school tradition and the glorification of technique.

This characterization is not harsh nor unjust, but rather appreciative and hopeful, and we may as well frankly recognize the truth of the verdict. We have, after all, made more rapid progress in art than any other people in the

world's history. Let us curb our impatience, take what satisfaction we can out of this fact, and content ourselves with the absolute certainty that we are on the rapid road to the best development of all the artistic spirit there is in us. If our artists do not at present show extraordinary signs of original impulse and individuality, it is no proof that these qualities do not exist. Indeed, there is every reason to believe that they are dormant or temporarily suppressed by the force of circumstances. Most of the young men who have returned since the Philadelphia Exhibition have, with a rare self-denial and enthusiasm, devoted themselves to teaching. There is a vast difference between teaching the rudiments to beginners and giving advice and assistance to those who are struggling with the higher problems of the profession. In the one case the labor of instructing is compensated by little or no gain to the teacher beyond his salary; in the other the artist finds himself encouraged in his own work, gains new ideas and fresh impulses, experiences constant rejuvenation from the intimate contact with younger men. Many of the prominent French and German artists have for years and without compensation devoted much of their time to the higher instruction of art students. By a complete system of elementary art education the pupils come into the foreign ateliers well grounded in all the rudiments, and depend on the master for suggestion and encouragement only in the direction in which his own knowledge is increased by the endeavor to impart it to others. The price of this constant effort is some loss of time and energy, but the reward to the master is the most precious of all rewards, stimulus to production and encouragement of singleness of purpose.

We cannot give too much praise nor too hearty recognition to those of our artists who have spent many of the best years of their lives in teaching the rudiments of their profession, for it is to them that we owe the present hopeful stage of progress, and it is by their self-sacrifice and devotion to the most intimate interests of art that we are fast approaching the time when we can no longer afford to allow them to dissipate their powers and exhaust their energy over the A B C of art education. When that time arrives, when our elementary schools are, as they should be, in the hands of those who either by nature are fitted for the work, or who may be in their own stage of advancement profited by such experience, then, with all the new and important fields now opening up before the serious artist, with the phenomenal increase of culture in the great West, with the extraordinarily contagious spirit of liberality among rich men, with the practical annihilation of the distance

between the United States and Europe, then and not before shall we find our artists free to put forth the best that is in them, unhampered by the sordid considerations which now beset them, and by the tardiness of recognition which is the most potent and baneful factor of discouragement. Then, surely, shall we see develop one element in our art which is now conspicuously absent—style. This element, the most intangible, the most worthy of encouragement, and, indeed, the most precious, can only exist under conditions similar to those just spoken of. Style without a high degree of skill is like musical taste without ability of execution. Style can be successfully developed only when the methods are mastered, for although it is in a measure superior to technique, it may be cramped and distorted by mechanical effort. The soul of all best art, it can only exist in its most attractive form in healthy and vigorous surroundings.

In the near future, too, we shall see encouraged and nourished the one branch of figure-painting and sculpture for which this country affords quite as good a field of effort as any other community—portraiture. We have a distinct type of feminine beauty, distinguished for symmetry and refinement; we have a strongly accentuated masculine type, full of character and picturesqueness. The first thing that strikes the observant eye of an American who, after a season abroad, returns to this country sensitive to fresh impressions of his native land, is the peculiar, nervous, high-strung, keen type of face, which has in it great elements of beauty, prominent marks of character, and an accentuation of lines which are particularly fascinating to the painter. The immortalization of this type is a task which may well fire the ambition of any painter.

It is natural to be impatient of processes, and it is difficult to wait for the fulfilment of the promise of planting, transplanting, and grafting. We already have a system of art education, which, though by no means so good as it can be and will be,—and perhaps not even justly to be called a system,—sends its students into the foreign schools quite as well founded in the rudiments of the profession as any other beginners; even, as it is often claimed, better prepared for rapid advancement. From California to Maine, from Texas to Wisconsin, there is scarcely a town of note that has not its art school and its art club. Art museums are numbered almost by the score. Private collections of works of art are increasing in numbers and importance with bewildering speed. Bequests to add private acquisitions to public collections are more and more numerous. The United States has now become the most active picture-market in the world.

A decade ago a few young artists in Paris met for the purpose of attempting to raise money enough to establish a European scholarship for American art students. The effort, although an earnest one, met with little success at the time; but the idea took firm hold on the minds of those who were interested in the scheme, and the enthusiasm, while it was somewhat checked by the indifference of the public, was still kept alive. Recently there have been established without any ostentation several such scholarships in different parts of the United States, all of them supported by private generosity, and now any young man who proves that he has sufficient talent and application to entitle him to a period of study abroad may secure one of these prizes.

Within the past few years also there has arisen here a coterie of picture-buyers who make a point of purchasing none but works by American artists, thus stimulating home production, softening the harshness of foreign competition, and gathering together, as is amply proven by occasional exhibitions, most interesting and choice collections of contemporary art which are revelations even to the most hopeful and enthusiastic friends of our artists. In various institutions there have been established funds for the purchase of works of art for permanent public exhibition. The library building of the city of Pittsburgh given to the city by Mr. Andrew Carnegie has, with equally unparalleled generosity, been endowed by him with a fund the annual income of which, fifty thousand dollars, is to be expended in the purchase of works of art for the permanent collection, and at least ninety per cent. of this sum is, by the terms of the endowment, to be spent for the productions of American artists. The extent of this gift is scarcely to be realized at first sight. What a museum of modern art will in a few years be built up by this fifty thousand dollars per annum *in perpetuo*! The income from the fund of the Chantrey bequest in England for the purchase of modern pictures is but twenty thousand dollars a year, and, so far as is known, was, up to the date of Mr. Carnegie's endowment, the largest sum in the hands of any institution for such a purpose. What a stimulus to production this fund in Pittsburgh will become! and what a power in the hands of the committee to urge our artists to turn from the tentative to the genuine accomplishment! The prospect is as encouraging as it is novel, and as bewildering in its possibilities as it is encouraging, for the Carnegie fund is doubtless the precursor of other similar endowments in different cities, and almost before we are aware of it we shall find this new factor one of the most important ones in our artistic development.

Enough has been said to show how widespread the interest in art has become in the past fifteen years, and how this interest has materialized, so to speak. The weakness of the situation lies in a measure in the absence of centralization. Not that a rigid system of centralization in art education is necessary, or even desirable, but some kind of a harmonious relation between the schools of the metropolis and those of other places might easily be brought about, so that the superior advantages of the larger communities might be held out as an inducement to the best pupils all over the country as a primary step in advancement toward the goal of higher artistic education. The difficulties in the way of giving the young artist all the necessary preliminary training are diminishing every year. There is no reason why our schools should not, in a very short time, send the best pupils abroad in much the same way, and with quite as good an equipment, as the students are sent from the foreign ateliers for travel and independent study in the art centers of the Continent. Most of the exterior advantages are now at our command in New York. There are excellent examples of the old masters in our Museum; the best work of modern men is seen here more easily than anywhere else; the photograph supplements these advantages to a degree which it was impossible to prophesy a dozen years ago. The one nourishing condition and the one which is most desired and the most necessary to the artist, the so-called art atmosphere, is beginning to be felt as a gentle, zephyr-like current which, before we are aware of it, will envelop us in its stimulating embrace. Architects have

long since recognized this current, and by the thoroughness of their schools and the seriousness of their advanced studies they have raised up a class of men whose taste and skill are leaving enduring monuments in this country which rank with any modern constructions, if they do not surpass them. Remote as it may seem, the suggestion, recently made, that the Government establish a department of art and architecture is an indication of the extent of the influence of this current. With excellent examples constantly before our eyes of tasteful architecture erected by private enterprise, we naturally feel the necessity of some central and responsible, not to say intelligent, control of the public decorations and constructions, so that we shall be more or less sure of protection from the monuments of bad taste and vulgarity which, in the confusion of public business, may be accepted by a political committee. Some national recognition of the profession of fine arts must soon result from the public estimation of the value of this element of civilization, and although we cannot legislate an art atmosphere, legislation may do much toward encouraging its growth. The taxation of works of art has been not the least powerful of the various causes which have retarded the progress of art in this country, and this will undoubtedly soon be removed in deference to the extensive popular sentiment against it, and in recognition of the wishes of a very large majority of American artists. What we have done in art and for art during the past quarter of a century is unparalleled in the history of nations. What we are now doing gives promise of speedy and gratifying results.

F. D. Millet.

THE HUNGER-STRIKE.¹

FROM other hands let fragrant roses fall
 On victors' paths; / look past Volga's flow
 To Hell's true Frozen Circle, realm of snow,
 Where rises Kara's evil prison wall!
 There fettered heroes did gaunt Famine call
 To be their Savior, when bent prone below
 The heavy yoke; racked Nature's throb and throe
 Steadfast they bore, till silence folded all.
 In the dim light, shoulder to shoulder, lay,
 In awful triumph, the mute, ghastly band,
 And tyrants cowered!—O Strong Spirits! we,
 Sons of this New World, glad in Freedom's day,
 Greet you! and with eyes wet, bowed lowly, stand
 Awe-struck before your mighty constancy.

Elizabeth W. Fiske.

HOW OLD FOLKS WON THE OAKS.

AFTER supper all the stable gathered round the big wood fire in Colonel Bill's room, even to the boys who walked the horses; for it was a bitter night outside, and the rain, driven before the raw, northern blasts, cut like bits of ice. Very pleasant it was within. The yellow blaze crackled gleefully about the logs and flooded the old room with its mellow light. It played hide-and-seek with the heavy shadows that clung about the corners, touched playfully the black faces of the stable-boys sprawling on the bare floor, and merrily sported with their ragged trousers and their patched cotton shirts. It dashed recklessly up the rickety ladder at the end of the room, and for a moment peeped into the loft above, and there finding the darkness uncongenial, rushed down and took absolute possession of the massive figure of Colonel Bill, dreaming with unclosed eyes in his favorite broad-armed, cane-bottomed chair. It made odd shadows on the strong, ruddy face and under the wide-open blue eyes, and threw against the whitewashed wall a fantastic image of the Colonel's tawny mustache.

Colonel Bill was thinking of the great meeting at New Orleans, where he had won race after race, and particularly did his mind dwell on every incident of the cup when the Mare had galloped away from the pick of the Mobile stable. Then he thought of the rich stakes and purses soon to be run for at Memphis, and especially the Oaks, where the Mare would have a chance to beat all the cracks of the South. He had been at the Memphis track a week now, and the horses had stood the trip from New Orleans well; there was not an unsound animal in the stable, and never in all her life had the Mare been in such perfect condition. The season thus far had been a most successful one; and as for the future, well, when a man is looking at the future from the sunny side of thirty, it is only the silver linings of the clouds which he sees. Colonel Bill did not earn his title in active service. He inherited it, together with his horses and his amazing capacity to absorb much whisky without affecting either his temper or his complexion. These things were his birthrights; for Colonel Bill was a Kentuckian.

So deep were the Colonel's musings that he paid no heed to Jim and Ike, two black mites of stable-boys, who were engaged in a bone-

breaking wrestling-match; and even when they fell under his feet he promptly kicked them away without awakening. Now and then some one belonging to an adjoining stable hurried by, seeking shelter from the driving rain. Loose doors, knocked about by the wind, creaked dismally on their hinges. Jim and Ike butted their heads against the floor in an ecstasy of mirth. Old Elias, yellow and solemn, "de kunnel's assistant, sah," sat bolt upright in his chair in the chimney-corner snoring ponderously. All these sounds came to the Colonel's ears like far-away echoes in a thick wood. Presently it seemed to him that there was a faint tapping at the door; or was it the ghost of the thundering hoofs of which he had been dreaming? Soon it came again, louder, stronger, more assertive.

"Come in," called the Colonel, rousing himself with a great effort.

The door opened, and, in a gust of wind and rain, a most remarkable figure entered. The visitor was scarcely three feet high, and his queer little wrinkled and puckered-up face was as black as ink. Cocked rakishly on the side of his head was an enormous silk hat, whose top was open to the winds of heaven and whose sides bore the marks of many a stubborn battle. The hat evidently caused its wearer much inconvenience, despite the jaunty manner in which it was worn; for it had a chronic habit of falling down on his neck, and it was only by unceasing care that this was prevented. The stranger's body was enveloped in a Prince Albert coat, originally intended for a man of six feet or more. The tails of the coat, although prudently trimmed, still trailed on the ground; and even with the sleeves rolled up, the tiny black hands were utterly lost in their cavernous depths. The trousers must have belonged to the same suit as the coat. The wearer carefully tucked them up at the bottom; but they refused to remain in that position, and fell down in the most embarrassing way.

When the Colonel saw this extraordinary figure, he rubbed his eyes and stared hard. Jim and Ike stopped playing and the whites of their eyes looked as big as snowballs. Old Elias woke with a snort, and for the first and last time in his life showed intense surprise. The visitor closed the door and walked up to the fire. After carefully warming himself in front he turned around and stood with his legs wide apart, his head on one side, looking at the group about him.

The Colonel drew a deep breath. Then, as he recovered from his surprise, he asked curiously:

"Well, Gen'r'l, whar 'd you come from?"

The little man arranged his hat, which had fallen forward instead of backward, entirely covering his face, and said in a high, childish treble:

"I come from Plastah Par's."

"Now, Gen'r'l," replied the Colonel, shaking his head solemnly, "how can that be so? Plastah Par's is white, an' yore the blackest niggah I ever laid eyes on."

Jim and Ike rolled over in convulsions of laughter. The visitor simply stared at the Colonel with his little beady black eyes, and repeated:

"I come from Plastah Par's."

"What 's yo' name?" asked the Colonel.

"Dey call me Ole Folks," said the boy, and then an expression of absolute vacantness settled over his little black face. It was in vain that the Colonel asked him how he got to Memphis, who his parents were, or how he reached the race-track. The only reply he received was a vague statement about a boat and a river. At last the Colonel grew weary and told Jim and Ike to give the stranger something to eat and let him sleep in the loft with them.

As the boys were tumbling up the ladder, Colonel Bill turned to old Elias.

"What do you think of him?" he asked.

"Kunnell Bill," cried the old man, earnestly, his eyes never leaving the stranger for a moment till he disappeared, "don't keep him around de stable. Befo' God, I b'lieve he 's onhuman."

The next morning the sun triumphantly climbed up into the sky, sweeping away the last traces of the storm, and, with the heat of that semi-tropical climate, driving the cold air before it like a conqueror. The boys were up with the sun, feeding the horses, walking them under the long open sheds, and galloping them out on the track. Old Folks helped them, and when their work was done, he went with them into the kitchen, a shed adjoining Colonel Bill's room, where fat Aunt 'Liza, enveloped in an aroma of fragrant coffee, was busily cooking crisp brown breakfast-bacon and golden corn-bread.

"Lawd sakes, honey," cried Aunt 'Liza, waddling across to where Old Folks sat, perched on a stool at the corner of the table, and for the third time generously filling the tin plate in front of him; "Lawd sakes, honey, you got de mos' pow'rfullest appetite I eber come across." It was not till every one else had finished that Old Folks left the kitchen, licking his lips, a look of tranquil happiness on his face.

Old Folks found a dozen of the boys lying on a load of fresh hay in front of the stable, their faces turned up to the sun. He was soon in the midst of them, and if he were uncommunicative about his affairs to the Colonel he more than made amends for it now. He told

them with many impressive gestures and rollings of his eyes how he came from a country where there were a king and a queen, where there were music and flowers, and where everybody wore "store clo'se an' had chicken five times a day." In this grand country Old Folks was the court dancer; and all he had to do to get any favor he wanted was just to dance. Ike listened to this story with growing signs of suspicion.

"Um," said Ike at last; "ef you could dance in yore own country, why can't you dance yere?" The crowd looked at Old Folks. The proposition struck them as being an eminently fair one.

"Dance yere!" cried Old Folks with great scorn. "Dance yere! How kin I dance when I ain't got no shoes?" Sentiment straightway shifted back to Old Folks. Ike was silent a moment. Then without a word he kicked off his shoes and pitched them over to Old Folks. Sentiment began setting back toward Ike. Old Folks, holding up one of the shoes for general inspection, said disdainfully:

"Ef I had *shoes*, I'd show you how ter dance; but how kin I dance a-standin' on things like them?"

Sentiment paused undecided.

Complaining bitterly of his tools, Old Folks nevertheless put on the shoes and jumped down from the hay. Just in front of them lay a stable door, torn from its fastenings by last night's storm. Old Folks propped up the corners with bits of wood and stone, and soon improvised a firm and safe stage. Then, with a look of triumph at Ike, he began to dance. The shoes were thick and heavy, and the door, as it lay, acted as a sounding-board, so that the boys for a dozen stables heard the dancing and came running over. They gathered in an admiring circle about Old Folks, who was dancing away with an absorbed look on his little face. Wherever Old Folks picked up his accomplishment, he was a master of it. The Mobile shuffle, the pigeon-wing, the old buck, and the hoe-down followed each other in hot succession. The audience yelled and cheered. Soon some trainers lounged up. The crowd kept growing and growing until half the track was gathered around Old Folks, who was every moment displaying some new grace, some fresh variation of one of the old favorites. Among the latest to arrive was Colonel Bill; and when Old Folks saw him he was inspired with renewed energy. Faster and faster he danced. The sweat stood out on his face in great drops. The corners of his mouth were drawn down. There was a tense look about his eyes. Occasionally he added to the artistic effect by yelling, "Oh, my!" "Come, my honey!" "Yes, indeed!" The stable-boys shouted and swayed their bodies, keeping time to the rhythm of the

sound. On and on danced Old Folks. A gray pallor showed through his black skin. The tense look deepened about his eyes. His breath was coming in gasps; but he kept up unflaggingly. Colonel Bill's big, lazy-looking blue eyes had been fixed on the boy for several minutes. At last he pushed through the ring of men and caught Old Folks by the arm.

"Perfahmance is pos'poned till another occasion, ladies an' gen'l'm'n," said the Colonel, waving his hand gracefully; and then, as he led the boy away, and saw that he was so weak he could hardly stand, he looked admiringly at him and muttered:

"He'd 'a' been dancin' there till he dropped ef I had n't come along. He 's the gamest little niggah I ever saw."

AND now for Old Folks, as the orators say, there dawned an era of unparalleled prosperity. He was the king of the race-track; and his subjects gave him a royal welcome wherever he went. For not only could he dance, but he could pick the banjo in a way no one had ever heard it picked before, and he could sing all the good old songs to its accompaniments; he could rattle the bones after such an inspiring fashion that every foot went to dancing without asking its owner, and he could tell a series of the most remarkable stories. Indeed, in the reminiscential line, Old Folks found that he had a virgin field to work. The only limit set to his imagination was his own forbearance. Perched on the sunny top of a bale of hay with the boys of a dozen stables around him, his head on one side, his little, withered, black face now drawn long with solemn import and now broad with mirth as his story demanded, Old Folks was inimitable. In addition to his other accomplishments he was a marvelous mimic; and even Colonel Bill himself, Old Folks's staunchest friend and supporter, was not spared. The Colonel had a habit of putting his thumbs in the arm-holes of his waistcoat, throwing his chest out, and whistling. Old Folks reproduced it with life-like accuracy. As a touch of local color he always ended by swearing at Ike.

There was one thing lacking, however, to make Old Folks's rule a permanent one. He hated riding. Indeed, he possessed a royal disinclination for work of any kind. He even protested against exercising the horses. He positively refused to feed them, and he would sooner have starved than rub them. But riding was especially disagreeable to him. The few times that he had been compelled to give the horses their exercise, he had displayed such judgment and skill that the Colonel, as a mark of special favor, had said to him one day:

"Old Folks, you kin gallop the Mare every mawnin'."

The morning after this permission had been so graciously given the Mare was not galloped, and the Colonel in a rage hunted up Old Folks. He found him in the stable, carefully wrapping a strip of blanket around his left ankle.

"Why did n't you gallop the Mare this mawnin'?" asked the Colonel sternly.

Old Folks looked up innocently. "Kunnel Bill, do you see dat lef' leg?" said he, and he pointed to the ankle, swathed a foot deep in many-colored rags. "Dat lef' leg ob mine am bogus."

"Seems to me," retorted the Colonel, "ef yore lef' leg 's bogus yo' dances mighty spry."

"Kunnel Bill," replied Old Folks, while a sly look crept into the corner of his eyes, "ef you eber took notice ob me a-dancin', you see I duz all ob it wid my right leg. Dat 's a powerful good leg, dat right leg, and dat lef' leg he jes' kind-a look on."

The Colonel turned away to keep Old Folks from seeing his face. That night old Elias, who had not recovered from his first prejudice against Old Folks, received orders from the Colonel to let the boy do as he pleased about riding.

It was not long, however, before Old Folks learned how fatal to his power was his inability to ride. In the community in which he lived everything turned on the race; and the most important factor in the race was the rider. Everybody around him who was not too heavy rode. Jim and Ike were given mounts frequently. Ike especially was a capital jockey; only his fondness for candy and the constant indulgence of his appetite made him a trifle too heavy for ordinary mounts. All the other boys had ridden in races at one time or another, and lived in the hope of some day being great jockeys. When they were all together, and the conversation by any accident was permitted by Old Folks to turn on horses, it was Ike's day and hour; and he gloried in it. He told all about his great races in the past, and about that one in particular where the Great Isaac had to "hump hisself" to beat him. He told, illustrating the words with copious gesticulation, of glorious bursts of speed in the stretch, due entirely to his superior skill, where he brought his horse from the rear when defeat seemed certain, and "won easy, an' me a-pullin' his head off." Ike had the stage all to himself; for he was an authority, and all Old Folks could do was to wrap himself up into a scornful little black ball and pretend to be sent to sleep by such stupid stories. But not a word of what was said did he miss; and after scenes like this it was always noticed that Old Folks told of some adventure more astonishing than any of the past, and that he danced, and picked the banjo, and handled the bones with unaccustomed vigor.

When the races began Old Folks felt his

power slipping away from him rapidly. The boys were riding horses to victory every day; and nothing was talked of from morning till night but the races. Little groups met around the stables and went over each race in detail. A boy's riding was criticized with marked candor, particularly if he was unfortunate enough to lose when the horse carried stable money. On the other hand, if he won, his lightest wish was law to a host of obsequious followers who hung on his words. All that he said was either oracularly wise or irresistibly funny. The stable and all that was in it were laid at his feet.

Of all the boys at the track Ike was the luckiest. All that seemed necessary for a horse to win was to have Ike on his back. It was an open secret that the Mobile stable wanted him, while half a dozen outsiders were fighting for second call upon his valuable services. It was the happiest period of Ike's life. He spent the pleasant sunny afternoons strutting up and down in front of the stables, his hat on the back of his head, his hands stuck deep into his pockets. He scorned the humbler duties of exercising and walking the horses, and treated the former friend of his bosom, Jim, with lofty contempt.

As Ike waxed great, Old Folks dwindled. Indeed, these were grievous days for Old Folks. All his old-time fire and dash were gone. Scarcely could he muster up courage to tell a story, and as for the banjo and the bones, the dust of neglect lay thick upon them. All day long he did nothing but think how he could regain his lost prestige; and at night he was tormented by disordered dreams in which, in all kinds of extraordinary situations, Ike was forever getting the better of him.

One day he was lying moodily on the grass in front of the stable when Ike, with a troop of admirers at his heels, came swaggering up. Ike evidently had something on his mind, for he stopped when he reached Old Folks, and after several efforts to appear entirely at his ease, he made them all "cross their hearts three times looking up," the most sacred oath the stable-boy, white or black, can take. Then, when their eyes were nearly popping out on their cheeks with curiosity, Ike told them that he was going to ride for the Mobile stable. He had seen Colonel Bill, and the Colonel with a terrific volley of oaths had told him he might ride to — if he wanted to. Then Ike lowered his voice and concluded in a frightened whisper:

"Kunnel Bill, he done said, 'Ike, if eber I ketches sight ob yo' ugly mug round dis yere stable, I 'll skin yo' 'live an' cut yo' black yeres off.'"

"Thought you wuz goin' ter ride de Mare in de Oaks to-m'a'h?" inquired Old Folks with a sneer.

"I can't get down to de weight," replied Ike, apparently ignoring the challenge, "an' anyhow, dat white kid from Nashville's comin' on. But he don't know no mo' 'bout ridin' dan, dan,"—Ike paused a moment for rhetorical effect, and then, looking at Old Folks, concluded crushingly,—"*dan you do, little nig-gah.*" And with this final shot Ike and his train, all of whom, of course, laughed uproariously at this repartee, left Old Folks to his own bitter reflections.

To-morrow the big race would be run, thought Old Folks, and Ike would of course win it, enabling him to climb to still greater heights of glory, while for himself were reserved corresponding depths of oblivion. He was roused from his reverie by Colonel Bill's passing him, giving the Mare her exercise walk, followed close behind by the faithful Elias. Suddenly an idea struck him.

"Kunnel Bill," he cried, jumping up and touching his hat, "Kunnel Bill, plea', sir, kin I ride de Mare to-m'a'h?"

Colonel Bill stopped and looked at the boy with an amused twinkle in his eyes.

"Why don't you git Archer to let you ride fur him in the Derby, Old Folks? He jes' cabled to me he wanted you." For once Elias failed to laugh at the Colonel's wit. He looked at the boy with unspeakable indignation. At the slightest hint from the Colonel he would have tossed him over the fence, but the Colonel only walked on with the Mare, chuckling to himself. On his return trip Old Folks was still standing in the same place. Again he touched his hat deferentially.

"Kunnel Bill," said he, appealingly, a little tremor in his voice, "plea', sir, kin I ride de Mare to-m'a'h?"

The Colonel was on the point of uttering some chaffing reply, when his eye chanced to light on the eager, strained look in the small black face before him.

"Why, Old Folks," he said kindly, stopping the Mare, "I 've got a good boy. You can't ride; an' this yere 's a great big stake. Matter co'se I can't let you ride."

Old Folks stood looking after him, big tears rolling down his cheeks. The Colonel, happening to glance back, saw him standing there, and his heart smote him; for he had a great liking for the queer little black, and besides the Colonel dreaded seeing anything suffer, man or beast. He threw the boy a silver dollar. "There, Old Folks," he cried cheerily, "go an' buy yo'self somethin'." The boy looked at the coin which had fallen at his feet, and then, his eyes sparkling with passion, he began kicking it in an ecstasy of savage fury. He never stopped until it was buried deep in the soft earth. Then, with his hands tightly clenched

and his little figure trembling with rage, he strode off down the track. The Colonel looked after him in amazement.

"Well," said he, "ef that ain't the funniest niggah ever I seen," and he walked on meditatively with the Mare, while Elias, following after, shook his head many times.

THE morning of the great race dawned bright and clear. The sun came rolling up into a cloudless sky. The air was redolent of the breath of the spring. If the weather could make it a success, the Oaks would be a memorable one. Colonel Bill had been up with the Mare before daylight. No other hand but his was ever allowed to touch her; for she was the very apple of his eye. And as he led her out into the morning air, and the sun shone on her glossy coat, the Colonel felt that so fine an animal had never before pressed the turf. Her large, soft eyes, so full of courage and intelligence, had that look which only comes with perfect health; and her every motion showed the fruits of the patient care and loving training of Colonel Bill.

Her trial, made before daybreak two days before, had been so good that Colonel Bill had kept quiet about it. He wanted long odds against her, and proposed making the winning of the season on the race. There was nothing to be done now but to wait; and as Colonel Bill finally closed the stable door on the Mare, he exultantly heard the cheering thousands, and saw his beauty led back by the grand stand to receive proudly the ovation of the victor.

Only one thing worried him. He had not heard from Grubbs. The boy ought to have come down the day before; still there was a train at noon, and that was three hours before the race. Grubbs had ridden her at New Orleans and knew all her peculiarities thoroughly. There was no absolute necessity for his presence, but, all the same, Colonel Bill would have had a load lifted from his mind if the boy were on hand. He sent Elias with a carriage to the depot an hour before the train was due, with orders to let Grubbs neither eat nor sleep, but to come straight to the track. From twelve o'clock on the Colonel scarcely had his watch a moment out of his hands. What was the matter? Why did they not hurry? What was keeping them? The Colonel fretted and fumed. When 12.30 came, with no Grubbs in sight, the Colonel could hardly contain himself; and when 12.45 arrived without Grubbs, he walked nervously down to the road to look for him. It was nearly one o'clock when Elias came dashing out to the track, his horses' necks covered with foam. Colonel Bill was standing at the gate and ran up to the carriage. Elias gave him a despatch, his hand shaking so he could

hardly hold it. It was from a friend in Nashville and contained one line:

Grubbsy can't come: dead drunk.

Those most familiar with Colonel Bill's well-known abilities as an artist in the use of forceful English unanimously declared afterward that he did full justice to the occasion. When he finished, hypercriticism could suggest nothing to be said. The sound of the storm penetrated through the stables to a loft into which Old Folks had crept to suffer alone and not be present at the triumph of his enemy. From the fierce energy of the sounds he knew something had happened, and a vague hope that in some way he might be benefited sent the blood tingling through his veins. He swung down from the loft, not waiting for the ladder, and rushed out in front of the stable. The Colonel was coming toward him, his eyes blood-shot. He was still talking about Grubbs. At last, exhausted, he walked over to the race-track fence, crossed his hands on the top plank, rested his chin on them, and glared into space.

What could he do? There was not a boy at the track capable of riding at the weight who was not already engaged for the race. It was absurd to think of sending elsewhere for a jockey. No, he would have to give it up. All his months of labor, of care, and trouble went for nothing. All those winter-evening dreams by the big wood fires were only dreams, hopeless of realization. While the Mobile stable was galloping off with the prize, the Mare would be standing in her stall; perhaps they would even say that he was afraid to start her. And then he thought of the recreant Grubbs, and lapsed into another transport. When he had grown quiet, only a few oaths rumbling in his throat like distant thunder in the gorges of the mountains, he felt something tugging at his coat-tails. He turned around, and there stood Old Folks. The boy touched his hat respectfully.

"Kunnel Bill," he cried with nervous eagerness, "Kunnel Bill, plea', sir, lemme ride de Mare."

Colonel Bill felt a little gleam of hope. It was with no change of expression, however, that he said shortly:

"Why, you can't ride; what do you know 'bout ridin'?"

"Kunnel Bill," cried Old Folks sharply, "ef dat fool niggah Ike kin ride, I kin ride. Ef de Mare don't win, you kin jes',"—here Old Folks paused a moment for a comparison, and then the Colonel's awful threat to Ike came back to him,—*"you kin jes' skin me an' cut my black yer'es off."*

"Why, you could n't sit on the Mare," responded the Colonel in a more mollified tone.

"Jes' try me," urged Old Folks with a voice of keenest entreaty. "Jes' try me, only plea', sir, try me once."

The Colonel looked at his watch. It was nearly two o'clock. The horses would be at the post in an hour. There was no possible hope of getting any one else. Then came a thought of the Mobile stable and the treacherous Ike.

"Old Folks," said the Colonel with great solemnity, "you kin ride the Mare; an' ef you beat that niggah Ike I'll give you mo' money than ever you heard tell of in all yo' life."

THE Oaks was the big race of the meeting, and all Memphis turned out to see it run. The crowd filled the grand stand and overflowed into the inner field, lining the track on both sides. Up in the boxes young ladies in gay attire made little exclamations and picked out horses to win because they had pretty names. On the lawn the crowd bubbled up into excited groups and fell away in quiet eddies, moving hither and thither, filled with the fever of unrest, as shifting and uneasy as the yellow waves dancing away off yonder on the bosom of the Mississippi, while all the time the brazen-throated ring brawled forth its odds. Everywhere there was motion, life. The entry of the Mobile stable, Cleopatra, was the strong favorite. The newspapers had been discussing her for weeks, and the public had concluded that she was invincible.

"What 's the matter with the Colonel's Mare?" asked Joe Sutton, the biggest book-maker in the ring, of a trainer who bet him on the favorite.

"Oh, she can't win," was the reply; "Grubbsy's went off on a toot and they've got nobody to ride. It's a walk for Cleopatra. There won't be nothing else in it."

"I never heard of that boy before," mused the book-maker, looking up at the list of jockeys. "O. Folks; who is he?"

"Only a stable-boy," answered the trainer. "A little nigger that don't know no more about ridin' than you book-makers knows about horses."

Joe laughed good-naturedly and went on with his book, lengthening the odds against the Mare. A strong tip was out on Catalpa and Fairy Rose, the Californians, and they were hotly played. The Johnsons of Alabama sent a commission in on their entry, Kathleen and Elizabeth. Blue Eyes found friends, and so did Tantrum. The rank outsider was the Colonel's Mare.

"I'll lay fifty to one against Bill's Mare," yelled the Chicago plunger, one of the heaviest betters in the Southern Circuit.

"I'll jes' go you a hundred," cried a big, ruddy-faced young man with wide-open blue eyes and a tawny mustache, pushing his way

through the crowd. The book-maker hesitated a moment, and then, rubbing his odds at the same time, called out to his sheet-writer:

"All right, \$5000 to \$100," and then, as the stranger walked away with the ticket in his pocket, he asked curiously: "Who is that fellow?"

"Don't you know him?" responded the sheet-writer. "Why, that 's Colonel Bill himself."

The Chicago plunger watched the Colonel going down the line, and he noticed that wherever the odds were particularly long, there the Colonel would stop, and wherever he stopped the odds were promptly shortened. He saw the Colonel at last leave the ring in the direction of the paddock with a big bundle of tickets in his hand.

THE last bell had rung and the jockeys had begun to mount. A big crowd was around Ike, who wore the blue-and-gold stripes of the Mobile stable, and who never looked more important in all his life. He pulled on the stirrups, to see if they were all right, looked wisely at the arrangement of the bridle, struck his whip jauntily against his leg, and strutted about, keenly enjoying the incense wafted up to him by the crowd. He never even deigned to glance at Old Folks, who looked smaller and blacker than ever, sitting on the Mare's back in Colonel Bill's all-white colors. Old Folks pulled his cap over his eyes and said nothing.

"I ain't got no orders fur you, Old Folks," said Colonel Bill, as he gave the girth a little final tightening. "You just lay with the bunch and don't go out and make no runnin'. Ef you manage to stick on till you come to the head of the stretch the Mare'll eat them up. You don't need no whip, for she ain't never been hit in her life and would n't understand it. Now go on and do your best. I'll never forgit you ef you win."

Old Folks answered never a word. He pulled his cap down harder over his eyes and set his teeth together grimly, and with Colonel Bill at the Mare's head, started out of the paddock.

They made a pretty picture as they galloped up the brown stretch of track, one by one, with the sun lighting up the party-colored jackets of the jockeys; and the crowd cheered them all good-naturedly. The first from the paddock was the favorite, Cleopatra, a handsome chestnut. The coal-black Tantrum followed. Behind her, dancing across the track from side to side, was Blue Eyes, a coquettish bay, drinking in with eager ears the applause she loved so well. Then came the Californians, two noble chestnuts. Hard behind were Kathleen and Elizabeth, the Johnson entry, each with a white star in her forehead. Last of all was the Mare. But so

lithe and graceful was she, with her haughtily arched neck and her dainty step, that the applause she received equaled that which greeted the favorite herself; and the Colonel, from his position on a little knoll beside the judge's stand, listened to it with a thrill of passionate joy.

All faces are now turned toward the head of the stretch where the start will be made. For a few moments the horses and the jockeys are blended together. Then the red flag in the starter's hand goes down like a flash; there is a leaping line of color, swiftly moving before a column of dust, and the race for the Oaks has begun.

The line which has extended across the track from fence to fence narrows toward the inner rail, like a fan closing; the dust has become a flaming yellow banner behind, the sunlight shifting through it; the jockeys' colors have begun to take separate form, and the figures of the horses to regain their identity. The first to catch the eye is Tantrum, who has shot out from the bunch, her gleaming black body clear of the field. The Californians are close behind her, with Kathleen and Elizabeth at their shoulders, while Ike and Old Folks are locked half a length away. Sweeping by the grand stand Tantrum opens up a gap of daylight. The Californians are still second, a length before the Johnson pair.

The pace is growing hotter. The long necks of the horses are stretched, and the race is on in earnest. As they round the first turn, Tantrum is still leading, but the distance has been cut down to a length. The field behind her are a solid body with the horses' heads so close together they touch each other. Suddenly there is a jumble. A half-suppressed cry comes up from the grand stand; and out from the mass, like a cat tossed from a balloon, come Old Folks and the Mare. They look to be standing still, so fast do the field leave them. Colonel Bill, whose trained eye has not lost a movement of the race, turns his head away and groans, "Cut down." Five lengths, ten lengths, twenty lengths, the others are leaving them as the waves leave a wreck.

And now the grand stand utters a cheer of encouragement. The jockey once more has his mount in her stride. At the sound of the cheering the Colonel looks up. But his heart is like lead when he sees the awful gap between the foremost horse and the Mare. He wonders, too, what's wrong with the saddle; for the boy's left foot is not in the stirrup.

They are well up the back-stretch, with poor Tantrum slowly falling back, her race run. The Californians are forging to the front, with Cleopatra at their saddle-skirts, Ike merely steadying her. A length away are the field, well bunched; while twenty lengths behind, out of the race, are Old Folks and the Mare.

As they thunder by the third quarter-pole, the Colonel rubs his eyes. Is he dreaming? Is the Mare really closing up the gap? He looks again. Old Folks is humped up on the Mare's shoulders like a monkey; and without pushing her, he is surely gaining ground. The Colonel's heart is beating so hard he can hear each throb as he closes his eyes to test the truth of what he sees. When he opens them again, he gives a whoop that sounds across the reaches of the track like a bugle-call, for the Mare is within ten lengths of the bunch, and on her back, still cool and unfurled, sits Old Folks.

They are nearing the fourth quarter-pole. Cleopatra is leading, the Californians at her throat-latch. Blue Eyes and Kathleen have improved their positions. Ike has not yet moved on the favorite, and even at this distance the Colonel can see a satisfied smirk on the traitor's face. Slowly, slowly the Mare is gaining. To the tense-nerved Colonel with his blood on fire it is a snail's pace; but inch by inch until the inches make feet, foot by foot until the feet make lengths, almost imperceptibly, yet as surely as the tide creeps in over the sand, Old Folks and the Mare are closing up their ground.

The leaders have reached the head of the stretch. Cleopatra is still in front. The star-faced Kathleen is beside her. The Californians are dropping back, dying hard. Elizabeth and Blue Eyes are just behind. And then, clinging so close to the inner rail that his horse's side seems to scrape it, to lose not an inch of space, is Old Folks.

Down the stretch they come, all fighting. Off in front are Cleopatra and Kathleen. The pace is a killing one, and the field are beginning to falter. The Mare alone is gaining. At last there is no longer daylight between her and the hindmost horse. It is poor Tantrum, sorely pressed. And now she is leaving Tantrum and is at Blue Eyes' throat-latch. And now Blue Eyes is passed, and she is at Elizabeth's saddle-skirts. And now Elizabeth is behind her, and she is abreast of the Californians. There is an instant's hot, sharp fight, and she has shaken them off, and only Cleopatra and Kathleen are left out there in front, neck and neck, just five lengths away. But five lengths! And that black rascal Ike is still holding Cleopatra back, with something up his sleeve.

Ten thousand eyes are upon the Mare. Ten thousand voices cheer her onward. Can she close the gap? Can she catch the leaders? Half the journey down the stretch is passed. As they swing by the eighth pole, Ike looks over his shoulder. He sees Old Folks's vengeful black face, just two lengths behind him! He loosens his last wrap and drives the spurs in deep. Cleopatra darts away from Kathleen like an unleashed hound. A moment more and

OLD FOLKS AND HIS AUDIENCE.

ENGRAVED BY J. H. E. WHITNEY.

the Mare has rushed by; and Kathleen is struggling in a ruck behind.

Ike is riding the race of his life. His whole heart and soul are burning up. He is lifting his mount along; whispering to her; sparing the whip with the wisdom of the great jockey; helping her by knee and hand and voice. But each time he glances behind, he sees the hated face of Old Folks, a little nearer.

They have reached the first of the wall of faces that lines the track. All about them is an ocean of whirling sound. For the last time Ike looks over his shoulder. The final gleam of light between them has gone. Without looking he can see the Mare's head gaining steadily, resistlessly. The head is at Cleopatra's flanks. It has reached her saddle-skirts. Ike can feel the hot panting breath against his cheek. But swiftly the head passes the saddle-skirts, passes the shoulders, passes the neck, and only the width of another head is between it and victory. And the judges and the timers, with their watches in their hands, silent and solemn, are standing over the finish-line just twenty yards away. Only a head between victory and defeat! Ah! Many's the race won and lost by that fateful space.

Old Folks's highly prized cap has blown off in that wild fight down the stretch. His round, black head is bent so low over his horse's neck that his face can only be seen in glimpses, as he urges the Mare onward. One thing alone he knows. Ike is so close to him, he can touch him. The shouting of the thousands is only a dull, distant rumble. Can he never pass that head rising and falling there, just before him? He is gaining, but slowly, slowly. And the distance is so terribly short. The calm-faced men with the watches in their hands are hardly a

dozen yards away. If they were only a furlong further, or half a furlong even. As they pass the Colonel not ten feet from the judge's stand, the two heads are rising and falling together, not an inch of space in favor of the one or the other.

The crucial moment has come. Old Folks digs his knees deep into the shoulders of the Mare, catches the reins with a grip like steel, and inspiring the high-strung animal beneath him with the fierce courage that burns in his own little black breast, with a last desperate, despairing effort he fairly carries the Mare across the line winner by a clear good head.

Out from the howling thousands, like one shot from a cannon, comes Colonel Bill. With a bound he is over the fence and is off down the track to the Mare, his face purple from much cheering. As the Colonel springs toward her, he sees Old Folks with the reins still in his hand, swaying backward and forward in the saddle, his lips the color of ashes, and his face all pinched with pain. He barely reaches the Mare's head when the boy pitches over into his arms.

"What's the matter?" ask a hundred voices as Bill, carrying the little bundle as tenderly as could a mother, shoves his way through the crowd to the Secretary's office.

"Nothin'," cries Colonel Bill fiercely, swallowing a lump in his throat. And then, as his big red hand wanders gently down the little leg to where the left foot is dangling helplessly to and fro, and he feels the edges of the broken bones sticking out through the skin, the tears gather so fast that the crowd becomes a blur. The boy winces and opens his eyes for a moment.

"Kunnel Bill," he says feebly, with a ghost of the old sly look in the corners of his eyes, "Kunnel Bill, I allays tole you dat lef' leg wuz a little bogus."

J. J. Eakins.

AFTER THE RACE.

BRONTË.

THERE are two ghosts upon the stair!
One is so slender and so fair —
The grave-light faints upon her hair,
And falls and follows as she stirs
With the old grace that once was hers,
Stirs on that chill and furtive breath
Blown from the frozen halls of death.
A dream, a film, along the air —
There are two ghosts upon the stair.

There are two ghosts without the door,—
One lofty as when first she wore
The purple of her youth, and bore
Her state like some young queen. Full white
And icy as the northern light
The death-mask on her face. And see,
A cold flame where her heart should be!
Calm, bitter calm, and fair and frore,
There are two ghosts without the door.

There are two ghosts beyond the pane —
In all the void and vast inane,
In all the vernal fall of rain,
In all the drifting of the mist,
When winds are high, when winds are whist,
In all the long sighs of the gale,
Two hovering wavering shapes and pale,
In all the wide night's dark domain,
There are two ghosts beyond the pane.

On wintry driving of the sleet,
Between those graves whose furrows meet,
She sees a yearning face and sweet.
All night she hears the great winds blow,
And sees the wild white whirling snow
Sweep up the black vault of the sky,
And sees a shadow fleeting by
That treads the storm with royal feet,—
There are two ghosts upon the sleet.

Out on the high brow of the moor,
Night lifting all her clear-obscure,
Or morn with primal tides washed pure,
While skies and larks together soar,
And the rime glimmers fresh and hoar,
Out in the glorious golden weather,
Knee-deep and lost in plummy heather,
In lonely space from lure to lure
There are two ghosts upon the moor.

And when along heaven's shining coasts
The summer evening leads his hosts
In the great train the pole-star boasts,
She sees from purple hollows shine
Eyes with a sorrow half divine,

And in a mist of stars will note
Ethereal weft of garments float,—
Pressing from faintest farthest posts
In heaven itself there are two ghosts.

Or dreaming there beside the hearth
Of lightsome days of ancient mirth
That cast a bloom upon the earth,
Of shapes that filled those happy years
Seen through the halo of her tears,
She feels them stealing nigh and nigher
To take the last flash of the fire,—
Woe to that house of gloom and dearth,
There are two ghosts beside the hearth!

Sometimes at night about her bed
The moonlight, in a glamour shed,
Puts on the likeness of the dead.
The glamour creeps along the wall,
Far off soft voices seem to call,
Soft footsteps falter through the room,
She cries, and reaches in the gloom,
And life, and light, and joy are fled,—
There are two ghosts about her bed.

The gentle cunning fails her hand,
Here where they woke, they wrought, they
planned,
While day slides o'er the lonesome land,
The needle poised, the pencil prone,
Pale fingers moving with her own,
The book, that once strange witchery threw,
Forgotten slipt,—they read it, too,—
Awake, asleep, astir, at stand,
There are two ghosts at her right hand.

What memories nestling in her heart
With wild, sweet wings of longing start!
The things they touched — with awful art —
The clock's dull tick, the walls, the doors,
The very shadows on the floors,
The old smiles, wake an aching fret.
Barbed with the poison of regret
Each moment gives a keener smart,—
There are two ghosts within her heart!

There are two ghosts upon the stair.
Long since Fame spread his splendid snare;
Love came and camped about her there.
Oh, love was sweet, and life was dear,—
But hark! those voices, strong and clear,
They wail, they thrill, she must not stay —
Out, to the open, and away!
Oh, love past death and death's despair,
There are three ghosts upon the stair!

Harriet Prescott Spofford.

THE AUTOBIOGRAPHY OF A JUSTICE OF THE PEACE.

BY EDGAR W. NYE.

Y father was a native of the State of Maine and a relative of Joshua Nye, whose prohibitory efforts have so long afforded entertainment for man and beast. The family record extends back to Cape Cod, where many of our people may still be found on Buzzard's Bay and toward the interior of Massachusetts. This fact I have kept concealed from the Nyes of Cape Cod up to this time, but I can no longer do so.

My birthplace consisted of a small hamlet called Shirley, now a station on the Bangor and Moosehead Lake Railroad, but at that time a happy and peaceful neighborhood clustering about a red sawmill in the midst of a rich belt of white birch and gum-arabic trees.

Few would have selected this as a birthplace, perhaps, but I have never had cause to regret it. Having now served its purpose, however, it seems content to recline on its laurels, and is in fact smaller to-day than when I chose it as a suitable site for my object.

Our humble home lay in the valley of the bright Piscataquis, within the shadow of the pine-clad pinnacle of Squaw Mountain, where the moldy blue bloom of the huckleberry slumbered in the quiet shade of the hemlock, or wooed with sweet and cunning coolness the advances of the wild bear and the woodchuck of the Katahdins.

We grew for the Boston and Bangor market the spruce gum that rounded the cheek of beauty in the high schools at Waterville and the Christmas tree that gladdened the hearts of the children of the prairie. In the rich soil of the valley, under the tropical sun of the Skowhegans, we reared the large red apple of commerce, and fashioned the richly carved ox-yoke which hung about the well-rounded shoulders of the bright red steer of the Kennebeckers.

My early life was uneventful after the 25th day of August, 1850, at which time I decided upon Shirley, and utilized it as the birthplace of greatness. It was, for the first three years, such a history as might be written of an ordinary person. Beyond getting strangled in a set of knitted harness by accidentally hanging myself over a stone wall till cut down by the authorities, and afterwards developing a style

of somnambulism which frightened the neighbors almost to death, I led a quiet life for three years.

Yet we were well thought of even then, and were acquainted with prominent people, especially the Hamlins and the Brownes, Stephen and Ephraim Browne, the uncles of Artemus Ward, being my father's schoolmates. So we were well connected even then, and I was already receiving a training which was to fit me so well in after years for the atmosphere of courts.

In the early part of the latter half of the present century, and while yet a child, I girded up my loins and, without other luggage, traveled westerly, taking with me my parents, who pleaded so hard to go that I could not well refuse them, especially as I had no other people with whom to leave them. Our journey was extremely exciting and filled with strange events. The latter part of it especially, which lay through the dense forests of Wisconsin, under the guidance of an old trapper named Thomas G. Nesbitt, was full of hairbreadth escapes and a noticeable paucity of food.

For quite a space of time we journeyed on by short stages, compelled each day to eat such wild animals as crossed our path, whether in season or not, and also the unbolted meal made of unsifted oats, with which we also fed the beasts of the outfit, so that even unto this day the oatmeal of civilization is to me a *bête noir* of great virulence. Finally our caravan came to a halt in the valley of the river Kinnick-Kinnick, and founded a settlement by treaty with the Indians, who, we found, had already preceded us. With the permission of the Government, and at the earnest solicitation of the Indians, we settled upon one hundred and sixty acres of beautiful ferns and bright young rattlesnakes, and it was here that my younger brother and an uncle were bitten by the cheerful fauna of that region. Whisky internally and plug tobacco externally, however, soon overcame the poison of the rattlesnake.

The Indians were extremely friendly at times, and preferred our salt-rising bread to the bread of idleness, which they had been using before we got there. We built up a good trade with them by exchanging brass rods, tin roofing, and pain-killer for beaver, buckskin, and ginseng-root, which we afterward bartered with the merchants of St. Paul for salt and other

delicacies, such as molasses, salt mackerel, embroidery, gunpowder, horse medicine, and saleratus. We constructed a low chalet of bass-wood, shingling it with swamp grass, and the following year put in a glass window. In this region I grew to ladhood, studying the benefits of industry and early attaining among the Indians a degree of social recognition of which I am still justly proud.

My life thus far had been one of earnest endeavor and vigilance, but I can see now that

TRADING WITH THE INDIANS.

it was fitting me even then for the position which I was afterward to occupy, of Justice of the Peace, during six of the most eventful years in the life of the nation. If I had thought of it in time, I would have studied a good deal more by the light of the pine-knot, but it did not occur to me until too late to be of use to me in an autobiography.

It is fair to say that my parents were very poor, but they were so honest that it occasioned comment. As they grew older they found that their integrity had become so fixed upon them that they could not throw it off. I shall never forget the time when it came over them like a clap of thunder from a clear sky that this habit had fastened itself upon them. "We are now past middle life," they said, "and it is hard to teach an old dog new tricks. We shall no doubt die as we have lived. But you," they said, with much feeling, "you are yet young. Your principles are still plastic; you are like versatile clay in your own hands. You can be what you will. Shun, if you can, the errors we have made. Do not allow any habit whatever to obtain entire control over you."

I now budded into manhood. It was a great hit. I had obtained quite an education—that is, mostly a practical education. I had attended school off and on, between massacres, by working out in summer by the month and then attending school winters, by dint of building fires and sweeping out the school-house for my board. Of course the board was not extensive, but almost every day some well-to-do and forehanded scholar would leave a doughnut or a piece of "bread and jelly" in his desk and forget it, or else voluntarily give me a nice, durable boiled egg for writing his composition for him, and so I got along real well and always with a blithe heart. That is one thing which aroused the admiration of one and all, an admiration in which I was at last compelled to join, viz: I had a blithe heart.

Passing on rapidly over this perhaps dull and uninteresting portion of a biography, let us proceed to the actual moment when a boy really blooms into manhood, and has singlehanded and with bare knuckles to meet the great, coarse, brutal world.

I remember very well when the day came on which I was gently but firmly invited to angle, cut bait, or go ashore. It was when I had outgrown the home nest. I was timid and of a shrinking nature. So were my clothes. At this time I was invited to buy into the farm with the privilege of allowing my wages to go in toward the payment of principal and interest,—interest first, then principal, like the motto of a political patriot from New York. I made a few rapid calculations covering one side and part of one end of the barn, showing that I would have to give up operas, balls, cigars, wine, underwear, summer vacations at Newport, and my club; that I would have to let my beard grow, cover myself with metallic paint, and work very hard all the pleasant weather in the field, and all the bad weather in the barn or cellar. Thus, as crops and prices were, I found that my wages and my own share of the crop would pay the interest and leave a small sum each year which would help to make up the deficiency between the actual cost of the crop and the price received.

I hope I make this entirely clear to the reader.

So I said: "No, I think that farm life, of course, for those who can afford it, is the most independent, the most chaste and lonesome one of which I know; but I am not worthy of it. I am too restless. I am too dependent on my fellow-man. I want to see him and look in his face and catch his reflected sunshine. I cannot milk a cow a month without drying her up.

"THE BOYS."

I cannot impress my own indomitable spirit of push and enterprise upon the hens as some can. I cannot pay for a team each year with gopher pelts as others do. I cannot stack wheat so that all the rain for thirteen miles will not come and run into the very midst of it. I am also too selfish to farm it, and besides, I have n't the money. Give my place to some more worthy man."

There was another thing about it which made it seem imperative that I should go away. Where I lived I was still regarded as a boy. I saw that where I had grown up and been whipped repeatedly I should never be able to secure absolute reverence. There are grizzly persons there now, three-score years old, who have not yet found out that they are men, because the community call them "the boys" yet, and address them by their first names, and so they have never shucked their boyhood; thus the smell and the sound of the battle of life have never been borne to them. They are silver-haired children yet, with big, fat, dimpled minds on which the world has made no scar. So one day, with tears, I turned my back upon the old home, which, although it had made rather a disagreeable specialty of industry, it seemed to me, yet held every element of a good home. Not as a fugitive with bruises and bitterness only to show for the past,—that would have been easier,—but as a boy whose home had been made always as cheerful for him as circumstances would permit, I plumed my wings for the wild and woolen West.

Securing second-class passage and not knowing exactly whither, so that it was west, I slept the nights away sitting upright in a coach, and landed finally in a territorial town accompanied

by thirty-five cents, with which I desired to aid the flourishing young city in her wonderful growth. I was also associated with a pale yellow trunk which cost three dollars and had been rained on, so that when I landed at Cheyenne the inflated thing peeled.

I cannot think of anything sadder than to be associated with a trunk which has made claims to respectability which it was not able to maintain. This trunk when new had aimed to impress people with the idea that it was a leather trunk, but when adversity came, it surrendered and peeled. When the wall-paper came off it was quite a plain trunk, and those who came in contact with it did not treat it with respect. I went to the best hotel, registered, and by some strange accident got a pretty good room; but I had to hurry and do it before my trunk got up there. Some would not have gone to the best hotel under such circumstances. They would also have said that I had no right to do so, but there is another way to look at that. Every hotel runs its business on a basis calculated to make it pay, allowing a percentage for losses in cases of this kind. I have been paying my percentage ever since, and probably paid it also when I paid my bill there several weeks afterward, which I did. But this was the nearest I ever came to being on the dividend side of the ledger of a hotel.

It would take some time to tell how I got the money to pay this bill, and how the lonely little lop-eared, écru-colored trunk stood there in the baggage-room waiting for the day of its redemption to draw nigh; but suffice it that a lucky accident put me in the way of earning ten dollars by copying the minutes

of a military court-martial then in session, and a tall angel with wings concealed under the cape of a Chumley overcoat was the means. His name was Remington, and I earnestly hope that he will find, when his life is over, that suitable arrangements have been made for his comfort.

Later I struck hard pan again, but the idea of despair did not enter my head. There is a general air of picnic and irresponsibility about a new country which certainly goes far to take the sting out of poverty. Stranded in New York, I would be tempted to fall from some elevated structure, perhaps, or with a shriek of despair to throw myself from the prow of some swift ferry-boat into the moaning tide; but where all is new, and where prosperity is ever generous, knowing that swift changes may in a few years or even months darken its own horizon, hope is the most hardy shrub that hangs upon the trellis of the heart.

(The above sentiment was written in an album at the age of eighteen years.)

If a boy could be made to believe that this one hour or day of battle with adversity may be the hand-to-hand fight of his life, compared with which all others following it may be mere skirmishes; if he could only know or even believe that the sky would never be again so somber, or his horizon so opaque — in nine cases out of ten he would win; but he fears too often that this is the beginning only of a long life of despair and disappointment. At that time I fully expected for a few days that I would have to assist in taking care of the Union Pacific Railroad, as a lawyer friend of mine had already done — going to California in considerable style and returning by easy stages as a section hand.

But the opportunity to do reporting at a small salary came to the surface soon after, and I improved it. The salary was not large; it was not oppressive. It was not calculated to canker the soul. By putting handles on it every Saturday evening, I was enabled to carry it home by myself, the distance being short. I used it wisely, not running through it as some would have done. In this way at the end of the year I had two dollars in money

and a nice new set of whiskers. I also had acquired a gum overcoat, whose views one could easily get by being thrown in its society for a few minutes on a warm day.

It was at this time that I was chosen by the will of the people to go and sit on the woolsack as Justice of the Peace. I do not quite remember the name of my predecessor, but I think it was Twitter. I know that I trembled for fear that I should not successfully fill his place, and so I used to go over to the penitentiary, where he was stopping for a few years, to get points from him as to my course of action. It strikes me now that his name *was* Twitter. At first I sought to evade the great responsibility, and told the people to search far and wide and that possibly they would find a more worthy man. They went away and were gone quite a long time. Then they came back and said, No, they could not find any one who seemed to be raised up as I was, to lead our people through the doubts and dangers of the coming years, up into the glorious light of peace and prosperity.

"Oh, go away," I was heard to say to them; "I fear that you are joshing me."

I was elected quite vociferously, for the people of the West are a humor-loving people and so entered into the thing with great glee. Therefore, on the first of January I procured a compressed room with a real window in it, through which the glad sunlight and 'most any other medium-sized object came softly stealing. Furnishing this room by means of a little bright red stove and a copy of the Revised Statutes,

THE MARRIAGE OF BEAUTIFUL SNOW.

BRONCO SAM.

I was ready to mete out substantial justice to those who would call and examine stock and prices.

It was really pathetic to see the poor little miserable booth where I sat and waited with numb fingers for business. But I did not then see the pathos which clung to every cobweb and darkened the rattling casement. Possibly I did not know enough.

I forgot to say that the office was not a salaried one, but solely dependent upon fees, the county furnishing only the copy of the Revised Statutes and a woosack, slightly and prematurely bald. So while I was called Judge Nye, and frequently mentioned in the papers with great consideration, I was out of coal about half of the time, and once could not mail my letters for three weeks because I did not have the necessary postage. Friends in the Eastern States may possibly recall the time when my correspondence, from some unknown cause, seemed to flag. That was the time. Of course I could have borrowed the money, but I had, and still have, a foolish horror of borrowing money. I did not mind running an account, but I hated to borrow.

The first business that I had was a marriage ceremony. I met the groom on the street. He asked if I could marry people. I said that I could to a limited extent. He said that he wanted to get married. I asked him to secure the victim, and I would get the other ingredients. He then wished to know where my office was. It occurred to me at that moment that there was no fire in the stove; also, no coal; also, that the west half of the stove had fallen in during the night. So I said that I would

marry them at their home. He maintained that his home was over eighty miles away and that it would consume too much time to go there.

"Where are you stopping at?" I inquired—using the Pike County style of syntax in order to show that I was one of the people.

"Well, we met here, Squire. She come in on the Last Chance stage, and I'm camped up in Gov'ment Cañon, not fur from Soldier Crick. We can go out there, I reckon."

I did not mind the ride, so I locked my office, secured a book of forms, and meeting the young people at the livery stable went out with them and married them in a rambling, desultory sort of way.

The bride was a peri from Owl Creek, wearing moccasins of the pliocene age. The rich Castilian blood of the cave-dwellers mantled in her cheek along with the navy-blue blood of Connecticut on her father's side. Her hair was like the wing of a raven, and she wore a tiara of clam-shells about her beetling brow. Her bracelet was a costly string of front teeth, selected from the early settlers at the foot of Independence Mountain. With the shrewdness of a Yankee and the hauteur of the savage she combined the grotesque grammar of Pike County and the charming naiveté of the cow-puncher. She was called Beautiful Snow. But I think it was mostly in a spirit of banter. She was also no longer young. I asked her, with an air of badi-

nage, if she remembered Pizarro, but she replied that she was away from home when he came through. The cave-dwellers were a serious people. Their plumbing was very poor indeed; so also were their jokes. Her features were rather classic, however, and—I was about to say clean-cut, but on more mature thought I will not say that. Her nose was bright and piercing. It resembled the breast-bone of a sand-hill crane.

The groom was a man of great courage and held human life at a very low figure. That is why he married Beautiful Snow without any flinching; also why I have re-

ONE OF THE ROAD-AGENTS.

frained from mentioning his name; also why I kissed the bride. I did not yearn to kiss her. There were others who had claims on me, but I did not wish to give needless pain to the groom, and so I did it. He had no money, but said that he had a saddle which if I could use I was welcome to. I did not have anything to put the saddle on at home, but rather than return empty-handed I took it.

It was soon after this that I decided to give my hand in marriage to my present wife. Concluding that I had more poverty than one person was entitled to, I made up my mind to endow some deserving young woman with a part of it. There was really something rather pathetic in the transaction, viewing it from this distance across the level plateau of gathering years. But it did not seem so then.

The sorry office with its hollow-chested wood-box and second-hand stove, red with the rust of time and the rain of heaven, the empty docket, the shy assault and battery, the evasive common drunk, the evanescent homicide, the far-away malice prepense, the long-delayed uxoricide, the widely segregated misdemeanor, the skittish felony,—all, all seemed to warn me and admonish me against matrimony, for there were two other justices and they got all the business.

I was elected fourteen years ago, and it never occurred to me that it was a piece of political humor until last week, when I was thinking over my past life.

Thus I married, and one evening while the town lay hushed in slumber, and only the mountain zephyr from the grim old Medicine Bow range rustled the new leaves of the quaking aspen and the cottonwood, I moved. Not having any piano or sideboard I did the moving myself. It did not take long.

Later on, the legislature, seeing that the county would have to provide for me in some way, decided to abolish one of the other justices. Then trade picked up. I was also *ex-officio* coroner. I would marry a quick-tempered couple in the morning, sit on the husband in the afternoon, and try the wife in a preliminary way in the evening for the murder. Thus business became more and more brisk. Sometimes a murderer would escape the grand jury and get lynched, but he did not escape me. If I could not try him in life's bright summertime, I could sit on him and preside over his inquest after the lynching. We had considerable excitement, too, in those days, for the town was young and laws were crude. Lawyers were still cruder. I know this because I was admitted to the bar at that time myself.

I rose early each morning while my heart and the dawn were breaking, and while the coyotes sang in the suburbs of the city. I

lived on the side facing the cemetery, for rent was cheaper there. In the early dawn a coyote band of soloists used to come over between the cemetery and my 'dobe house and sing. Those who have never heard a coyote's chastened welcome to the jocund day do not know what compressed despair and unavailing regret can be concealed in the wail of a wild animal. To a man who was doing his own work, and cutting enough jack-pine firewood before breakfast to do for the day, the shrill notes of the coyote, echoing among the gray slabs which marked the lonely resting-places of the dead, were not filled with delicious joy. I judge that the coyote has been politically on the wrong side for three or four thousand years, and that his sorrow has become chronic and his nature soured. Possibly it is something else, but the bitterness, the diatonic hopelessness and forbidding despair which he gets into one little bar of music would do a good business in the drama if it could be properly staged.

The most attractive day's work that I remember was the preliminary examination of a band of stage-robbers, captured by Sheriff Boswell and a posse in the early morning. I examined them in the forenoon and held a double inquest in the evening on two gentlemen from a tie camp in the mountains. That was my busy day. I think Bronco Sam called that day also to be married to Mademoiselle Walk-Around-the-Block. Bronco Sam was a semi-Greaser, whose parents on his father's side came from the Congo Basin and settled among the peanut vines and citron groves of Middle Georgia. I was too busy to marry him that day, and so he went elsewhere, fearing that if he put it off he might change his mind. Later he shot his wife, and then blowing out his brains instead of turning them off he closed his career with the regular red fire and fortissimo bass-drum of the new West.

The stage-robbers had among them the gentlemanly, genial, and urbane Irvin and the brainy but somewhat erratic and felonious "Kid." They were captured by a band of gritty frontiersmen under Sheriff Boswell. Boswell was not a toy frontiersman with long, accordion-plaited hair, tied back with blue ribbon, in which at springtime the swallows come to build their nests and rear their young. He was a plain, quiet man, with the scars of Indian arrows all over him, the record of an early day when you could not fight Indians by means of a Pullman car. I always admired him because he cut his hair and manicured his nails even in the early days. Boswell was not reckless of human life, and in fact killed very few people, but if a bad man had to be captured and brought to camp in good order, he generally had the job.

Once I heard a shot in the hallway of my place, and going to the porch on the second floor rather cautiously, I saw the rest of the tragedy. Windy Smith had been shot by a gambler whose name I've forgotten, though I had to try his case a day or two afterward. Some shouted, "Take away his gun."

I said, "Yes, certainly, take away his gun." I am not a good hand to remove guns at such a time, but I can direct others. I was born to command.

Then some one yelled, "Lynch him." A dozen healthy men made a grab for him, but Boswell came along then and took the gentleman home with him. A day or two after, fearing that he would be lynched if brought to my office, I examined him at the courthouse, which also contained the jail.

Reading a charge of wilful murder to him, I asked him to plead, but he said nothing. Then I asked him his reason for killing Smith. He had none. His reason had fled. The scare he got at the time when he expected every moment to be lynched had driven him mad.

These road agents, however, were a picturesque little picnic party. They had probably not slept in a house for two or three years, and they needed repairs. They removed their spurs and piled them up in the corner of the room like a large bed of cactus. Their side-arms and Winchesters made quite a little hardware store on top of my desk. They were disagreeable men in some respects, and yet they did much to elevate the stage, especially the Rock Creek and Black Hill stages. Irvin was tried finally for some minor felony and got nine years. On top of this, in some way, he was also indicted for murder in the first degree and got a life-sentence. The jailer found him in tears afterward, in his cell.

"Why do you weep?" asked the gentle jailer, looking sadly into the uncertain light.

"Because," said the sobbing outlaw, "I shall be so busy serving out my life-sentence that I do not see how in Sam Hill I am going to get time to serve out those nine years for plain robbery."

But incidents of six years' life on the bench would require too much time and space for a short sketch like this, and so I will not add to those given already, except one which will show that courts do not always receive that respect and reverence to which they are entitled.

We had a German *restaurateur* who could cook well, but prosperity overthrew his good resolutions, and so about every thirty days he would give way to a taste for the native-grown wines of Kentucky, and he would then start out as a painter and decorator of an otherwise quiet

and gentlemanly little town. At such times it became necessary to extend the strong arm of the law, and to issue the ukase for the arrest of Wilhelm in order that the peace and dignity of the Territory might be maintained. After several such arrests, and a fine with its attendant trimmings, Larry Fee, an officer, was again required to take him to the fountainhead of justice.

"Who makes ovid dot vorrand?" asked Fischer.

"You will have to go before Judge Nye," said the officer.

"Chudge Nye!" says Fischer. "Chudge Nye! Dot feller dot comes down py der debo fen der drain gomes een? You baid your sweed life he ish no chudge. He looks more like dot beenuts poy on der drain."

At another time I was alone with a criminal called Dirty Murphy. The officer had gone to get witnesses for the prosecution of Murphy on the charge of larceny. I needed some more coal on the fire and I had no valet. The coal was down a flight of stairs in a crypt under the sidewalk. I could not leave D. Murphy alone for fear that he would steal the rapidly cooling stove and fly with it; so I asked him if it would be too much trouble for him to go down and get a hod of coal for me, so that at his trial we could make it warm for him. He said certainly not. I gave him the hod, and although it has been something over thirteen years he has not yet returned. On leaving the woolsack to my successor I told him about Dirty Murphy, and said that he was liable at any moment day or night, footsore and weary, to come back, and that it would be a good idea to leave the door ajar for him; but it was not done, and so at this writing I do not know where he is.

Of course, during the six years of my judicial life I met with many reverses, especially at the hands of the Supreme Court, but I am proud to say that during all that trying time I was sustained and soothed by an unfaltering trust in the people even though the higher courts did not sustain and soothe my decisions as I wish they had.

Looking back over those eight years of life in the new West where a State has since blossomed into being, and where the eagle's nest of the snow-capped Rocky Mountains has given place to the mare's nest of doubtful political methods, I am forced to ask myself this question: Is there anything in the way of official triumph and official honor in all this that cannot be attained by most any bright young American? Certainly not. Patient endeavor, untiring industry, and political purity, coupled with a profound intellect and massive thought-works, will surely win in the struggle for prefer-

ment, and there is no reason why any young man so equipped who reads these lines may not ultimately rise also to a position as justice of the peace.

Every year, and in fact almost every month, some justice of the peace dies. Who are to fill these places? The young men of the nation. The bright-eyed students and farm

hands who are just attaining their majority. Fit yourself, therefore, young man, that you may be able, when the time shall come, to occupy the woolsack thus left vacant by the death of older justices of the peace, and if you do so with credit to yourself I shall feel that this brief bit of autobiography has not been written in vain.

Edgar W. Nye.

MAZZINI'S LETTERS TO AN ENGLISH FAMILY.

IT has been the privilege of the writer to see the originals of Joseph Mazzini's letters to an English family, now for the first time to be given to the public by Madame Venturi, the surviving daughter of William Henry and Elizabeth Ashurst.

The name of Ashurst is not altogether unknown in America. Frequent mention of it occurs in the life of William Lloyd Garrison written by his sons, and Mr. Garrison himself has told us, in his introduction to a volume upon "Joseph Mazzini: His Life, Writings, and Political Principles," issued shortly after the exile's death, that it was at Mr. Ashurst's beautiful home at Muswell Hill that he first met the great Italian. "There," he says, "our personal friendship began [1846], which revolving years served but to strengthen." Twenty-one years later, on a visit to England in 1867, Mr. Garrison and Mazzini met again. "The interviews I had with him — alas, all too brief! for of his company one could never tire — were," says Mr. Garrison, "at the residence of Mr. Ashurst's son . . . and of his son-in-law, James Stansfeld, M. P." . . . His "altered appearance affected me sadly. There were, indeed, the same dark, lustrous eyes; the same classical features; the same grand intellect; the same lofty and indomitable spirit; the same combination of true modesty and heroic assertion, of exceeding benignity and inspirational power, as in the earlier days, but physically he was greatly attenuated, stricken in countenance, broken in health, and evidently near the close of his earthly pilgrimage. But no marvel! During our long absence from each other what mighty intellectual forces he had brought into play! . . . What hairbreadth escapes, what fiery trials, had been his!"

The intimacy between the Italian exile and the Ashurst family began soon after he succeeded in proving the fact that his correspondence had for a long period been violated by the English Government. His letters were sys-

tematically "opened and resealed, with all the ignoble arts of a Fouché," before being delivered at his house. This, incredible as it may seem, was done in a room set apart for such purposes at the Central London Post-office, and the information obtained by this means was regularly forwarded by the English Ministry to the Austrian Government, which was thus enabled to entrap and arrest the brothers Bandiera and other Venetian exiles at Naples, and to cause them to be shot by the Neapolitan Government in cold blood, without even the semblance of a trial. All these things, and the indignation they called forth in England, are matters of history, matters upon which it would be more interesting to dwell had the popular wrath been carried to the point of compelling the abandonment of the system; but that, unhappily, survives to this day. Special interest, however, lies for us in the fact that indignation at the wrong and sympathy for the personal sorrow thus inflicted upon Mazzini impelled Mr. Ashurst's son and eldest daughter to seek his acquaintance and to invite him to their father's house. It is obvious that the exile was as much attracted toward them as they were drawn toward him; for although it was his habit to shun English society, he at once agreed to go to Muswell Hill on the following Sunday, and it quickly became, to use his own phrase, "an established institution" that he should there pass his Sundays with those whom he called his second family. The tone of his letters when separated from them is indeed that of a son and brother, and they regarded the relationship given and accepted as their highest honor.

The first idea of publishing some, at least, of Mazzini's letters occurred to Madame Venturi as far back as 1851, during a conversation with the exile's mother. Madame Mazzini then suggested that her young friend should write her son's life, and, as a portion of the necessary materials, gave her the complete collection of his letters home, and allowed her to note down certain details and anecdotes concerning his childhood and early youth which

she related. Madame Mazzini said she could not doubt that future generations would do justice to the patriot, the thinker, and the statesman in him, yet, owing to the life of solitude and concealment he had been compelled to lead, she feared the man would never be rightly appreciated and understood. "It is only through his letters to those whom he deeply loved," she added, "that that heart of gold can be known."

Mazzini was compelled, in every part of the Continent, to lead this life of concealment, because, being condemned to death by the seven governments of Italy, he was liable to extradition in all monarchical countries save England. Thus "correspondence was the sole method of his ceaseless, persistent apostolate of Italian unity; correspondence, revolutionary and political, formed his only weapon of offense or defense in the 'lifelong duel between himself and the ignoble governments of Italy'; and correspondence was, in very truth, *communion* with those he loved; the one consolation of what he sadly alludes to as 'the life I have led for twenty years out of thirty,¹ a life of voluntary imprisonment within the four walls of one little room.'"

That such communion was a real necessity of his loving nature explains the childlike spontaneity of the letters themselves. He wrote as he would have talked to his adopted family had he been again in England, a return to which he often spoke of as "coming home."

The special charm of the letters now before us consists in the fact that even when they treat of political matters they remain essentially intimate, personal, and confidential. They show us, so to speak, the other side of the medal. All the world is familiar with the picture drawn of Mazzini by the monarchical press of Europe, all the world has heard of the dark conspirator, the teacher of assassination and rapine, who, actuated solely by reckless ambition, aroused the rash, unthinking youth of Italy to rebellion against the paternal governments of the seven states into which the peninsula was divided, and drove them into revolts the danger of which he had not the courage to front himself. But in these letters we see for the first time the tender, loving nature of the man, who, during the years in which they were written, was tracked by the police of Europe like a hunted animal.

Mazzini's English, though by no means faultless, is extremely picturesque and at times even eloquent, and the public will certainly agree that Madame Venturi has done wisely in leaving his occasional errors uncorrected, except in the rare instances in which, to those unaccustomed to his style, they might obscure his meaning.

Madame Venturi, being at the time of Madame Mazzini's suggestion very young, and moreover diffident of undertaking the

task assigned to her (quite unnecessarily, for it would be impossible for the great subject of the projected work to have had a biographer more completely equipped with the requisite gifts of insight, sympathy, and literary ability), wrote to Mazzini informing him of his mother's request, and expressing her desire to accede to it (subject to his approval), in association with Maurizio Quadrio, his trusted and devoted friend. Although it was Mazzini's habit to attach very scant importance to matters personal to himself, he promised to help wherever help was possible, but added:

My life is all contained in my writings and in the dominating idea of my soul — to help to create an Italy; a nation powerful in faith, in unity, and in the social European idea pre-announced by her emperors, her popes, her great thinkers, and her martyrs. My individual existence, concentrated in a few affections, might well be left where it is — in a few tombs and in the hearts of those who love me.

The nomadic and agitated life Mazzini led during the years that followed rendered it impossible for him to furnish his would-be biographers with the requisite materials to enable them to carry out his mother's wish; but chiefly owing to their urgent and repeated reminders, he began the autobiographical notes which embellish Messrs. Smith and Elder's edition of his "Life and Works," and helped to rescue from oblivion his scattered political and literary writings which were collected for that edition.

Visiting at Muswell Hill forty years ago appears to have been a far more serious matter for Londoners than it is now. By night no help could be obtained from railway or stage, and chartering a cab for the day was too expensive a proceeding for exiles, or indeed for the majority of the English *habitués*. The little group of friends who had passed the afternoon and evening at Mr. Ashurst's delightful home generally assembled in the porch at about half-past ten, to light their cigars and to journey together on foot as far as the Angel, Islington, where cabs and omnibuses were available.

Muswell Hill quickly became to him what he called it, his heart's home; and the little family festivities, which usually have no charm for outsiders, were his chief pleasure. Being unable to make one of the circle on the first day of 1847, he wrote to Miss Ashurst, "The initiating day must not be allowed to pass without two words of mine reaching Muswell Hill." And his letter concludes, "Pray for me that the year do not elapse without my finding an occasion for acting and proving myself worthy of your esteem and affection."

The peaceful gatherings at Mr. Ashurst's house were indeed soon disturbed by the news

¹ Written in 1861.

of uprisings in Sicily and Naples; but the movements were partial, lacking in organization and quickly quenched in blood. "The Sicilian and Neapolitan affairs are saddening me to the heart's core," he wrote. "Ah me, how long it takes to teach men their duty, and, consequently, victory!" But in September, 1847, he writes:

On the whole, things [in Italy] are improving. Our *moderates* are left behind by the people; never mind what they print or shout in the danger, the real danger, that which unsettles me, is the one concerning unity; unity, not a *political* crotchet, but the thing upon which every other depends, our power of doing good, our mission in the world, the dream of all my life, the one condition on which alone the Word may come to the world again from Italy. There is real danger for *that*. Between our princes yielding, our *moderate* leaders preaching, our having never been *one* country, our hopes, our fears, our absolute political ignorance,—for all that is done springs from instincts, not from thoughts just now,—it is rather difficult to see one's own way clearly to *that*. To such uncertainty you can attribute the enthusiasm for the Pope. . . . I consider this as the last agony of popedom authority. And in my own way of feeling I would not be sorry to see a great institution dying, for once, in a noble manner; transmitting the watchword of the future before vanishing, rather than sinking into the Crockford or Tuileries mud of the English aristocracy and French monarchy. A moral power, like a great man, ought always to die so; uttering the words of dying Goethe, "Let more light in." . . .

The true cause of the English enthusiasm about the Pope's reforms, or intended reforms, is this: they do not esteem us; they feel toward us with Christian charity . . . they sincerely wish us to be better fed, clothed, lodged—made more comfortable, on the whole. As for unity, nationality, a mission in and for Europe—these are treated like dreams, things to which we have no claim. I speak of course of the generality. . . . There is too much of the passive tendency in Christian courage; a logical consequence of the little value given by Christianity to our earthly life, which, after all, is the only implement that has been given to us for us to reach a superior life.

When the news of the proclamation of the French Republic (February, 1848) reached London, Mazzini went immediately to Paris to confer with the members of the Provisional Government and to ascertain their probable international policy. He was requested by the People's International League, an association formed at his suggestion, to present an address of sympathy to the new government, and was accompanied by Mr. Stansfeld¹ and two other members of the league.²

A month later the victorious insurrection

of Milan and the expulsion of the Austrian army from lower Lombardy took place, and Mazzini hastened to Italy. April 7 he wrote:

I am in Italy, at Milan. At the frontier the custom-house officers knew me; they quoted to me some words from my writings. At Como I was surrounded by people, priests, and young men. . . . I felt moved, deeply moved, when I entered Italy, but, strange and sad to say, without joy. Never mind; if I am, as I fear, dead to joy, I am not dead to duty. I write by night, before going to bed, tired as I am. To-morrow I shall plunge in the midst of all sorts of men, and try to see clearly the state of things.

On the 11th he says:

I send a paper containing an account of my reception here: it was such that I wished you all here, because I knew you would have felt happier than I did. I had felt far more in the morning in seeing some two thousand of our Italian soldiers belonging to the Ceccopieri legion, and who had left *en masse*, at Cremona, the Austrian flag, passing under my windows in the midst of the people frantic with joy; and they themselves looking intoxicated with the feeling of being, once in their life, loved by their countrymen. Still there was an importance in my own reception; it was a republican manifestation . . . it was such that five minutes after there came a deputation from the Provisional Government to invite me to go to them. . . . I tell you all these things because I know that you will be delighted with them. As for me, alas! it is evident that the power of rejoicing for myself is dead within me. I found myself crying like a child at the sight of the soldiers of the Ceccopieri regiment, and I feel almost frightened at those demonstrations, and very much disposed to run away.

I crossed the St. Gothard; there was danger, but the scene is sublime, Godlike. No one knows what poetry is who has not found himself there, at the highest point of the route, on the plateau, surrounded by the peaks of the Alps in the everlasting silence that speaks of God. There is no atheism possible on the Alps.

The government here is composed of heterogeneous elements; a majority under secret engagements to Charles Albert, a minority belonging to our men, but rather timid and wavering.

It is characteristic of Mazzini that his thoughts were not hindered by the fact that "there was danger" from turning to those left behind in his English "home." In this letter he inclosed a violet, "the first *viola dell' Alpi* I saw." It must have been gathered on the Italian side of the pass, where the spring flowers first thrust their tender heads through the melting, and therefore dangerous, snow. By "our men" Mazzini means the party of Italian Unity, who were desirous of taking advantage of the actual defeat of Italy's most formidable foe to carry on the war and to arouse the populations of the other Italian States to imitate the hero-

¹ Son-in-law of Mr. Ashurst, now member of Parliament for Halifax.

² Messrs. Dobson Collett and W. J. Linton.

ism of the Milanese, and to emancipate themselves from their foreign masters. The King of Piedmont had been compelled by the excitement of his Italian subjects to declare against the Austrians, to enter Lombardy with his army, and to pose as a protector; but he was naturally alarmed at the prospect of a popular war. As the son of a Savoyard Duke and an Austrian mother, he had no hereditary bias of Italian sentiment in the matter. The people of Italy are, by tradition and tendency, republican, and it was obviously probable that the various States, if once freed from foreign domination, would aspire to unity under a republican flag. Therefore, although for a while tempted by the bright vision of winning the crown of Italy, the king ultimately decided that his safest course was to sacrifice Lombardy by delivering up Milan to her former masters. He declared to the people that he came "to lend them that assistance which brother may expect from brother," and he caused the Provisional Government to issue a manifesto promising to await the settlement of the national question till every portion of Italy should be free; "when all are free, all will speak." But the despatches of English agents in Italy during this period inform Lord Palmerston that the king is entering Lombardy "in order to prevent the proclamation there of a republic," of which there was imminent danger. . . . "The situation of Piedmont is such that at any moment at the announcement that the Republic had been proclaimed in Lombardy, a similar movement might burst forth in the States of His Majesty," . . . and they go on to assure the minister that the king felt that by thus taking means "to maintain order in a territory left by force of circumstances without a master," he was acting "for the safety of all other monarchical states." Madame Venturi, in her memoir of Mazzini which prefaces the volume published by Mr. T. A. Taylor containing "Thoughts on Democracy" and the "Duties of Man," has given an admirably lucid though brief account of the betrayal of the republican party by Charles Albert and the Moderates. She quotes frequently from the despatches, which, of course, remained unknown to Mazzini until their publication in the Blue Books long after these insurrections were at an end. Mazzini's military instinct, however (which was so remarkable as to have amounted to genius, and which elicited the warmest eulogiums from old and tried commanders, signally from Moltke), confirmed his suspicion of royal treachery when the king ordered the withdrawal of the Italian volunteers from the passes of the Alps which they were guarding. This order left open the roads into Austria, and enabled the Austrian general Radetzky to revictual, rein-

force, and reorganize his army, demoralized by defeat. Mazzini continues:

The Charles Albert party is intriguing very actively, . . . still our party [the party of Unity, which had faithfully accepted the program of "awaiting the decision of the national question until all were free to speak"] is strong, and I am trying to organize it. . . . It will be impossible for me to write letters for a while, but read attentively the papers; you will be able to detect what I do.

And you all, my best friends, what are you doing? I know that you are thinking of me very often. I am full of faith in you; I thought of you when on the Alps, of you when the soldiers passed under my windows, and I will think of you whenever I will feel most deeply — *à la vie et à la mort*. . . . Think of me when you are at Muswell Hill. . . . Farewell, not for ever.

Your JOSEPH.

Could you know the *gachis* [muddle]! I have this morning an *ouverture* for an alliance of the republican party with Charles Albert on certain very liberal terms and for a "*rapprochement personnel*" [with the king]. They must feel us very strong to come down to such a proposal after fifteen years of relentless war. [Mazzini was still under sentence of death in Piedmont as well as in all the other States of Italy.] I have answered that I did not wish for any *rapprochement personnel*. Let Charles Albert break openly with every diplomatic tie, every connection with other places [Italian States], let him sign a proclamation to Italy for absolute unity, with Rome as the metropolis, and for an overthrow of all the other princes, we [the republicans] will be soldiers under his banner. *Se no, no*.

Of course the answer was no.

Madame Venturi tells us¹ that the "very liberal terms" of which Mazzini speaks with characteristic indifference to personal advancement were "that he should constitute himself patron of the royal scheme of uniting Lombardy to the crown, offering him, in that case, power to draw up the constitution of the new kingdom of the north, an interview with the king, and the position of first minister of the crown." His mode of rejecting this glittering program — his first important public act after his return to Italy — is a typical example of his conduct as a patriot, and a sufficient answer to the charge, persistently made against him to this day, that he invariably put the republic before every other question. He was then, as on every other occasion, ready to accept *unity*, which was the essential condition of Italy's taking her righteous place among the nations, at the hands of the king.

Notwithstanding all my aversion for Charles Albert as the executioner of my best friends [he wrote] and the contempt I feel for his weak and cowardly nature, notwithstanding all the demo-

¹ Memoirs.

cratic yearnings of my own heart, yet, could I believe him to possess enough even of true ambition to *unite* Italy for his own advantage, I could cry amen.

But Mazzini knew too much of Charles Albert to feel any real hope. He writes:

. . . I have refused to be a M. P. for Genoa and for I know not what place in Piedmont, refused to be more than that with the man Charles Albert, refused all the offers of the tempter, and I remain the republican Joseph you know. Do not believe (this not for you but for my male friends) that it has been owing to pride, reaction, or any other narrow feeling. No; I told all tempters the same words that I address to Charles Albert in my Manifesto. . . . Was I not right? Meanwhile I am here, disliked, dreaded, suspected, calumniated, threatened more than ever, and my writings are burnt in my native town, Genoa, almost under the eyes of my poor mother, and threatenings of death are uttered here in Milan. How the reaction has been produced, how they have spread amongst the lower class calumnies against me, how they contrive to make me appear a sort of ambitious Catiline, would form too long a story for me to write it. I feel quite strong and immovable and smiling at all this; but I cannot deny my feeling entirely an exile in my own country; feeding my soul with its own substance, like the pelican its little ones. Do not exaggerate to yourself my position here. . . . I am, politically, strong enough, and *that* is the cause of the uproar; but I was speaking about myself, about Joseph, and not about Mazzini. . . . Will you write me a long letter full with particulars about all your family? And tell them all that I *wish* to write every day to each of them, and cannot. Still, *they* can. . . . Tell me every bit of thing concerning you and the family, my life is so dreary! . . . Addio: writing or silent, I am, *ora e sempre*, yours,
JOSEPH.

But in spite of all calumnies, busily spread by both open and secret enemies, Mazzini had done much, as will be seen by many passages in his letters, to enlighten the people as to the illusory nature of the bulletins forwarded from the camp; and when at length the news came that Udine was retaken and that the Austrians were advancing upon Milan, he regained all his extraordinary influence. Even the Moderates, who had been denouncing him as an ally of Austria, turned to him in this hour of danger, and he, mindful only of how to rescue the people, at once organized a committee of defense. But his measures quickly alarmed the king, who, having failed to buy him over, now managed successfully to undermine him. The "wretched creatures of the Provisional Government" placarded the walls of Milan with the official announcement that the king was coming to defend the city, and "the people," wrote Mazzini, "believed themselves saved;

they were therefore irrevocably lost." Fully convinced, himself, of the king's treacherous intentions, but unable to convince the deluded people, alone he left the city, "God knows with what grief," and joined Garibaldi's volunteers at Bergamo. How entirely Mazzini's worst apprehensions were fulfilled by the king's stealthy withdrawal of his troops by night, so leaving Milan ready for Radetzky to enter with his reorganized army at daybreak, is well known.

Milan having fallen, the rest of Lombardy soon followed, and the Austrian rule was before long reinstated. Mazzini wrote to one of the Ashurst family (Emilie, now Madame Venturi):

Your note, dear, the beautifully noble letter of S—, and the very thought of you, even if you had been silent all, would have strengthened me in my trials. There are a few, very few, chosen beings on this earth and elsewhere who will always have the power of saving me from doubt or despair. I can [may] sink, but not in such a manner as to make them ashamed of me, and you belong to these, my guardian angels. I am up again and at work. Between Austria and me *c'est un duel à mort*. . . .

Do not feel too sad. We — not I — had to expiate the sin of having thrown at the feet, not of a principle, but of a wretched man, our sacred flag. . . . I have seen my mother at Milan before the end. God bless your mama; I have her carbine still.

This was a rifle which Mrs. Ashurst had given him just before he started for the scene of insurrection. She asked him one evening after his journey had been determined upon what he would best like to have as a parting gift. "A carbine," he exclaimed laughingly. His "second mother" scarcely knew what he meant, but when she remembered what the word stands for in Italian, she cried, "Very well. I will get you the best rifle there is to be had."

The carbine saw but short service, but we get an interesting glimpse of its intrepid bearer in a graphic letter from Colonel Medici, whose column Mazzini joined. He describes the enthusiasm of the volunteers at the "unexpected appearance among them of the great Italian, rifle on shoulder, demanding to fight in their ranks as a simple soldier. My column," says the colonel, "always pursued by the enemy and menaced with destruction every moment by a very superior force, never wavered, but remained compact and united, and kept the enemy in check to the last. In this march, full of danger and difficulty, the strength of soul, intrepidity, and decision which Mazzini possesses in such a high degree never failed, and were the admiration of the bravest amongst us. His presence, his words, his courage, animated our young soldiers, who were, besides, proud of partaking such dangers with him; . . . his

conduct has been a proof that to the greatest qualities of the civilian he joins the courage and intrepidity of the soldier."

It is difficult to realize that the man who could write thus of the great apostle of republican freedom actually, as the king's governor of Palermo in 1870, cast him into prison.

One of the most noteworthy points shown in this correspondence is the way in which upon Mazzini's mind "coming events cast their shadows before." Thus, after the disbanding of Garibaldi's volunteers, he writes that "things are going on in a certain way at Rome," and, having described how the Tuscan movement in favor of union with the other provinces of Italy had been "stifled by our own doctrinaires," he says, "I suppose that toward the end of the year I shall leave the Lombard frontier for another, *if they have sense enough at Rome.*" A little later he says, "I am well enough [*assez bien*] in health, which I mainly attribute to your mama's stockings." A little later he writes to Emilie:

I am obliged now to keep my curtains down on account of the sudden apparition of a man on a little roof dominating my window. The man was only looking for a hen, but it has been enough to frighten the friend who keeps me, and the consequence is that I cannot see the sky. . . .

You do not say a word, you ungrateful daughter, about Mr. Ashurst. What is he doing? Is he patronizing peace as when I visited him at Muswell Hill? I certainly must address myself to Mrs. Ashurst for a long, full-of-details letter on Muswell Hill and its inhabitants.

In the December of that momentous year he wrote to Emilie of his father's death. His grief is characteristically resigned.

But [he says] though a believer, I am a man. I wanted to see him before his going away. I was dreaming from time to time that I would still be able to give him a joy — one single joy — before, for I have given none in life, . . . to realize in part the idea through which I have been an exile, and to go to him and say, we have been separated, but our sufferings have achieved some good for our country, for our fellow creatures. To me success in lifetime is nothing; to him it would have been a supreme, all-compensating joy. . . . I think of my mother too, of her loneliness, and dream of joining her somewhere, but where, and when?

Less than two months later, on the 9th of February, 1849, the Republic was proclaimed at Rome, and the Pope fled ignominiously, in the disguise of a lackey, from a peaceful population only desirous that he should remain as their spiritual head. Mazzini was in Tuscany "vainly endeavoring to infuse one single spark of Italian life into the Provisional Government" constructed after the flight of the Grand Duke,

but he had already been declared a Roman citizen and elected a member of the Roman Assembly. On March 2 he wrote to the Ashursts that he was starting for the sacred city,

feeling very gloomy, wishing for physical action on a barricade more than for any other form of activity. Everybody — Austria, Naples, France, England — seem to be against us. The foreign press is shamefully hostile. . . . All the articles I occasionally see in your press, a tissue of lies. . . . A blessing upon you all. Yours with everlasting affection,
JOSEPH.

He entered Rome on foot, alone,

with a deep sense of awe, almost of worship. . . . Rome was to me, as in spite of her present degradation she still is, the temple of Humanity. From Rome will one day spring the religious transformation destined, for the third time, to bestow moral unity upon Europe.

Mazzini believed that twice already God had chosen Rome "as the interpreter of his design among the nations." His profound and philosophic study of history taught him what, among his predecessors, had been revealed perhaps to the genius of Dante alone, — namely, that the subjugation of so many nations by ancient Rome — "a mere city, a handful of men" — was the fulfilment of the Providential design to prepare the world, by subjecting it to a single power, for the teachings of Jesus to spread and to cause a new life to spring up everywhere in the earth. "God consecrated Rome to this mission; therein lay the secret of her strength." Rome for the second time gave the "Word" to the world by maintaining the unity of the spiritual hierarchy, by sustaining, in the name of the moral law, a desperate struggle against the arbitrary power of kings and feudal lords, and by the fruitful victory "of mind over royal arms," of spirit over matter, gained by one of the greatest Italians in genius, virtue, and iron strength of will, Pope Gregory VII.

Mazzini's whole being was lighted by the new, the coming gospel — unity of spiritual and temporal law, the end of the long divorce between earth and heaven, the fresh definition of politics as religion in action; his life was an exemplification of its truth, and now, in the movement within the Holy City, the presentiment, the aspiration of his soul, might begin to find fulfilment.

Shortly after Mazzini's arrival the Roman Assembly, foreseeing war to be inevitable, passed a decree investing three of its members — Mazzini, Saffi, and Armellini — with the supreme executive power. The new government was of course installed in the Quirinal, and Mazzini afterward comically related to the Ashursts how he uneasily searched for a room "small

enough to feel at home in." The letters to the Ashurst family during this period are of great historic interest, but the facts concerning the brief though glorious Roman Republic are so well known as to render quotation from them unnecessary here. Mazzini was able, for the first and only time in his life, openly to lead his countrymen before the eyes of the world, and personally to direct his country's course; Rome became the center of interest to all the European nations, and the eyes of all were fixed upon the figure of the great triumvir, whose measures and administration afterward caused Lord Palmerston to declare that "Rome was never so well governed as under Mazzini's rule."

But not even his genius, his supreme devotion, and the wonderful effect upon the people of his personal magnetism, could save Rome from the iron heel of treacherous tyranny. On July 2 he sadly writes, "We are conquered, dear Emilie; the French are in the town to the number of nearly 40,000 men, and Rome is *en état de siège*."

Mazzini remained in the city for a whole week after the entry of the French, wandering about the streets unable to tear himself away. It is well to mention this fact, because, even to the present day, numerous absurd stories are told of his disguises, etc., whereas he never condescended to any disguise in his life. The only means of changing his appearance, to which he occasionally, and always unwillingly, submitted at the earnest entreaty of his English friends, was shaving off his beard and mustache.

In May of 1850 he went to Paris, when he wrote to the Ashursts:

I am decidedly, unless arrested before, "the coming man." . . . I shall come straight forward to you, stop with you in half seclusion, and seeing people only by tickets of admission signed by you during *one week*, if you do not send me away before of course. Then I shall have a room somewhere and see *l'Univers*, taking refuge, if possible, every evening, . . . in any house belonging to the clan. . . . Eliza¹ is well; she is coming, it appears, with me to London.

After passing a few months in England, Mazzini returned to the "life of concealment" in Geneva. Toward the end of the year (1850) Matilda (Mrs. Biggs) and Emilie Ashurst went to Italy, and shortly after their arrival in Genoa they received, through Mazzini, the news of the death in childbirth of their eldest sister in Paris. Writing to Emilie, he says:

. . . Eliza is lost to us. It is strange that it is from me that you are to receive the sad news, but

I would have claimed the mournful task had I been with you. . . . I have lost two sisters during my exile, and I know that such a loss puts into one's life a shadow never to be removed, a blank never to be filled. I cast my arms and my soul around you and ask you to be strong for your mother's and Caroline's and my own sake. I could say for Eliza's sake, for I do not believe in such a thing as death. It is for me the cradle of a new existence.

To the mother he writes, November 29, 1850:

. . . Like the Macedonian legion, when one was falling, draw nearer all you that remain; love each other more dearly; see, help, advise one another more than ever; commune with her who has loved and loves you all by communing more intimately with one another, and remember, for God's sake, that there is no such thing as death for all that is best in us; that what people call death is only a transformation and step onward in life. Love is a vouchsafer for immortality. We would not scatter a single flower on a tomb if there was not an instinct in the soul teaching us that our love pleases the cherished one who is buried beneath, and depend upon me there is more truth discovered by these flashes of the virgin soul than by all the dim, painfully elaborated lanterns of analysis and reasoning knowledge. . . .

And this faith of mine, which I would give all my actual life gladly for feeling able to infuse into you all, and my grieving with you all over our loss, and my loving you all more dearly than before — that is all the consolation I can give to you, dearest friend. I wish I could be with you during these days, and it makes me feel bitterly the bondage of my condition. Still, I live, think, feel with you the best part of the day; and I dreamed of you all during the few hours of sleep I had last night. My dear, dear friend, how I should wish to be able to take on my own, poor, doomed life all your sorrows, and to yield to your own all the smiles that your affections have been yielding to it. . . .

Part of 1851 and 1852 was spent by Mazzini in England. In August, 1852, his mother died suddenly in Genoa. Emilie, to whom the news was sent, at once went round to him at his lodgings, which were close to the house (Belle Vue Lodge, Chelsea) where she and the Stansfelds were living. After telling him of his loss she left him, at his own request, alone. In the evening he did not appear as usual in the little circle at Belle Vue Lodge, but he sent the following lines, written in pencil:

I am strong, and I have nerved myself to this blow these last six months. Do not distress yourselves too much. My mother is too much a sacred thing for me not to be strong. Do not come. I want to be alone for one day. But write, each, one word of blessing; it will do me good. And you, Emilie, write what particulars you have.

God bless you.

Yours,

JOSEPH.

¹ Mr. Ashurst's eldest daughter, then married and living in Paris.

The next day, Sunday, he wrote :

I trust you go all to Muswell Hill. One day lost for your mother would be a sin. But if she is ill, and you think your news can do her harm, do not say the whole. Take Mazzoleni with you as agreed.

The blow is hard to bear, now especially that I had a hope to repay within the year her long years of loneliness with a moment of joy. Now, even if I reach that moment, I shall be an exile on my own land. Perhaps it is better so. Who knows what can happen? I feel as if they had taken from me some essential part of myself; but I am calm and firm. She has not lost me; and I deeply believe that I have not entirely lost her and her holy influence. Tell James that I know all that he feels. Your notes have done me good, and I feel your presence and love around me.

Yours,

JOSEPH.

On January 2, 1853, he left for Italy on account of the insurrection impending at Milan, organized by a wide-spreading secret association of working-men, who before acting appealed to him for assistance. From the frontier he wrote :

I am here. I write only a few lines, dear, but it will be a joy to you to know that so far I am safe. I arrived at four o'clock this morning, and as soon as I reached the place appointed I found that I could not stop there. A *commissaire de police* had been the evening before looking for Saffi, who has been, of course, walking everywhere and showing himself to everybody. So that I have been obliged to go through fields and valleys to another house. . . . I have been thinking of you all as much, I fancy, as you have been of me. I have been unusually well on board, and I fancied that it was owing to the warmth of my chest given by your mama's waistcoat. Tell her this, and tell Bessie that had I not wrapped myself in her own gift I would have been frozen to death.

In a letter to William Ashurst, describing his journey, he says :

The season suits the Alps, which looked to me, spite of cold and wind, the most sublime poem of eternity which has been written. It is poetry leading to action, stern and rugged as duty, strong as faith, pure and serene like hope and immortality.

The rising of the people at Milan failed, owing to the treachery of one of the leaders, who at the last moment betrayed the secret of the conspiracy to the Austrians, and fled. Mazzini, having remained in the midst of the "storm whistling round" him as long as his presence could serve any useful purpose, retreated to Switzerland across the difficult pass of the San Bernadino. He wrote to one of the Ashursts that he made the journey

in an open sledge, for the diligence could not pass, under snow, wind, and all the physical evils possible, my horse rolling twice in the snow until I really began to think . . . I would have to send you my last farewell from there. I could not help dreaming of Cain turned away from the terrestrial paradise, the wrath of God threatening him, the accursed—I, too, accursed now by all, by those especially who have ruined the scheme. All this I scorn; the thing itself is weighing on me . . . my best men persecuted here, in Piedmont, everywhere; all our arms seized . . . the leaders still in danger, the heroic workmen of Milan baffled, imprisoned, and worse . . . the leaders, with their faults, will remain unknown. They [their names] are nothing to Italy, and I must be the scapegoat on whom all the faults of Israel will be heaped with a curse. All this is very little to me, but it is this which keeps me here for a while. Were it not for this, I would fly to my harbor in grief or joy—Belle Vue.

In 1854 Mazzini's "second mother" died. Her increasing illness had been made known to him, and he had striven to reach England in time to see her once more, but absorbing duties withheld him. The beauty of what he wrote to the Ashursts could alone mitigate in some degree the pain to them of his absence in this time of sorrow.

I receive, dear Emilie, your sad lines. . . . I had feared, foreseen,—you know it. . . . I felt that I would not see her, my poor second mother, any more, when I left her for the last time, and I shall feel her loss almost as deep as my mother's. Am I not one of yours? Are you not all my family, my chosen family, the only beings whom I can now love here below? It will be a heavy, dark cloud on what remains of life, a new, deep furrow on the soul—one smile vanished forever, one touch of loneliness which through joys and griefs will never leave us. But oh, for God's sake, and for her own sake, let it be only that for you, for Caroline, for Matilda, for William! Let it not be the withering, dry, atheistical despair which she would blame and which would make her sad above, but the pious, loving, consecrating grief, making us better—better loving, more devoted to the truths she taught, more bound to all that she loved. Let us do nothing, feel nothing, which she would not approve. Let death be the Christening to a renewed earnestness, to the high religious belief, to all the immortal hopes, which nourished her angel soul.

Let you all feel, as I shall, her presence more now than ever. Let you all believe—as you believe in my undying affection—that death is the cradle of a new, purer, and happier life. It is so. God knows I would not give, at such a moment, a mere poetical instinct as a consolation. I know it is so. Every departure of loved beings—and except you, *all* have departed—has made me feel so more and more. Your mother is living, loving, wanting love; longing for your rising [some time], calmly and trustfully, to her, and rewarded for the love she had, for the good she did and wished

to do, with some more power to help you on, to influence you with holy, virtuous thoughts.

Mazzini's letters during the Neapolitan Revolution are of exceptional interest because even more full than usual of details, making clear to the minds of his adopted family the complicated and varying relations of parties and persons in Italy. His own situation was very similar to what it had been after the Milanese movement in 1849.

"What Louis Napoleon, Cavour, and *hoc genus omne* want," he wrote, "is to prevent what they call *revolution* spreading."

The story of Garibaldi's triumphs is well known, but the untiring efforts of Mazzini, the influence over the people of his unquenchable faith in nationality, and his complete self-abnegation, are still almost unknown, being overborne by the meretricious glory of the soldier of fortune who handed Italy over, for better, for worse, to the grasping hands of monarchy. Writing from his concealment in Genoa, on the 23d of May, 1860, he excuses the "terror in all the *bourgeoisie*" at his presence among them, "because they fancy that to honor me would be war with Louis Napoleon, which would be an immense danger for us until we get the South." He describes the military part of the scheme to which Garibaldi had agreed, and continues:

The great thing is not my position; it is the birth of a nation. It is worth while submitting to anything for that. . . . Nevertheless, what you say of my position is perfectly true, and certainly I think I have never been so faithful to duty as in this period; my moral suicide is complete.

But in another letter he unconsciously shows the amount of suffering he was enduring. He who rated matters personal to himself so low writes, "I really feel sick at the position in which I am—at the vile abuse which is poured on me whilst I am sacrificing all the dreams of my life for Unity's sake." And in this noble sacrifice he was to meet once more what he had already encountered so often, disappointment; for the material organizer of the movement upon Naples, Dr. Bertani, to whom Mazzini was "doomed to be the Egeria," meeting him secretly by night to instruct and inspire, received an unexpected visit from La Farina, Minister of the Interior, was "overwhelmed" by his representations, and Mazzini sadly wrote to Mrs. Stansfeld that "through plenty of reasons which I cannot explain I saw that the labor of two months, the *aim*, the whole scheme was at an end, destroyed at once, and the whole affair changed into a fifth or sixth reinforcement of Garibaldi, who wants none." Later he writes: "You saw Garibaldi declaring himself a dictator in the name of Victor Emmanuel. It is bad

and ungenerous in one who carries help, but *anything* from him just now would be welcomed."

Mazzini was extremely fond of birds, and wherever he went he was sure quickly to be known to the birds of the locality, who would soon allow him to handle them. In his place of concealment in Genoa he formed what he called a society of sparrows, who visited him assiduously at meal-times. At the end of one of his long political letters he says:

To the society of sparrows I have added two hens—I have always been fond of hens—whom I feed after dinner, sometimes with bread and wine, to strengthen their constitutions against shocks and adversities.

And again he remarks:

My two sparrows are getting more friendly; one especially, who is my favorite because he is deprived of his tail. I take him up very often, at which he pretends to be raging, and pecks me very hard; then, when I open my hand, he remains there and will not stir. He, or it, never goes to his cage in the evening unless put in by me. This is all my amusement and emotion.

Patiently, as usual, after the betrayal of Garibaldi, Mazzini took up the broken strands of the disrupted Italian party (those who aimed before all else at making Italy a nation), and for this purpose he again started a newspaper. He went to Naples, and worked incessantly at writing articles, seeing people, instructing, inspiring, organizing; but amid all the turmoil, sorrow, and labor he never forgot the dear ones in England, nor lost for a moment his sense of humor.

Lack of space forbids following Mazzini's further movements in Italy, though perhaps at no period had his life been more useful to his distracted country. His untiring vigilance seemed at times almost preternatural, and more than once the "Sword of Italy" and his "magnanimous ally" found their plans suddenly unmasked and their anti-popular ends frustrated by the dauntless writer of the "tiny missives which have shaken thrones." But before passing on to a few of his last letters it is well to revert to one dated 1858, written to Emilie, who was then at Newcastle. Speaking of his approval of the agitation for manhood suffrage led by Mr. Joseph Cowen, afterward M. P. for Newcastle, he says, referring to his Liberal friends' "Whiggish notions" in the matter:

They are all involved in the capital error of assuming the mission of the government to be that of welcoming and acknowledging the *educated* ones, whilst it is that of educating those who are still uneducated. I take the suffrage to be the starting-point of political education—the program, as it were, of education given to the masses; the

putting before their eyes a task to be fulfilled, which is the preliminary stage of all education.

In May, 1867, he wrote :

Dearest Emilie: I have less than you have to say. Besides, I am feeling between the unhappy and the furious about the Fenians condemned. To-day, I think, is the Queen's birthday. Does she read a newspaper? Cannot she find a womanly feeling in her heart and ask the Cabinet to commute the punishment? In point of fact, the killing of those men will prove an absolute fault.¹ Burke will be the Robert Emmet of 1867. A feeling of revenge will rekindle the energy of the discouraged Fenians. The dream will become, through martyrdom, a sort of religion. But that is not my ground. It is the legal murder reënacted against a *thought*, a thought which ought to be refuted, destroyed by thought only. Burke and others who are now doomed are perhaps the only noble characters² amongst those who led—the trial showed them to be genuine believers in Irish nationality. I think they are philosophically and politically wrong; but are we to refute a philosophical error with hanging? To-day a deputation of members, Mill, James, and others, were going to Lord Derby to insist. I have a very faint hope the Cabinet may reconsider.

This brief notice of the letters of a great genius cannot be better closed than by two quotations which exhibit the deep and manifold love that was the mainspring of his every thought and action. To Mrs. Stansfeld he wrote from Lugano in 1871:

Yes, dear, I love, more deeply than I thought, my poor, dreamt-of Italy, my old vision of Sa-

¹ It was his habit to use this word as the French do, as a grave mistake or error.

² Madame Venturi had written this, but doubtingly, wanting evidence.

³ Her Catholicism.

⁴ Lamennais.

vona [the fortress where he was first imprisoned]. Worn out, and clearly — to me — unequal as I now am to the task, or to rule the movement, I cannot get rid of the thought. I want to see, before dying, another Italy, the ideal of my soul and life, start up from her three hundred years' grave: this is only the phantom, the mockery of Italy. And the thought haunts me like the incomplete man in Frankenstein, seeking for a soul from his maker. It is the secret of all my doings, which you cannot, most likely, understand, and which I cannot explain by letter.

And in January, 1872, two months before his death, he wrote to the same correspondent:

I must tell you a little additional deception of these days. When I heard of the death of my sister's husband I wrote to her, offering to go and spend some time with her under the same roof, just to comfort her loneliness. She refuses on account of her principles,³ and of what she owes to the memory and presumed wish of the dead husband. It is the old excommunication, and from her it came rather bitter to me. I do not react, however, and remain as I have been toward her.

Madame Venturi has told us in her memoir of Mazzini how, striving to reach England in order to spend with the Ashursts a cherished anniversary, he crossed the Alps at the most inclement season, took cold, was seized with pleurisy, and died at Pisa. The longing to forget, if only for a brief moment in his stricken life, the sense of exile,—"that consumption of the soul,"—and to be with those who so truly loved him, was too great for resistance; but, alas! far from their ministering hands, far from the solace of their loving hearts, his spirit entered that mysterious pass "where two cannot walk abreast and where, for an instant, souls lose sight of each other."⁴

Stephen Pratt.

IN THE PAUSES OF HER SONG.

A SINGER who lived in a sunny land
Poured forth a song so full of cheer,
The murmurer, listening, forgot his plaint,
The mourner, to shed his tear.

Oh, what a happy lot is hers,
Said the toiling world as it heard,
To pour forth songs as carelessly
As joy from the throat of a bird.

Alas, I said (for Art is long:
I have trodden its weary way, and know),
Could you but dream of the struggle and woe
That come in the pauses of her song!

Orelia Key Bell.

A RIVAL OF THE YOSEMITE.¹

THE CAÑON OF THE SOUTH FORK OF KING'S RIVER, CALIFORNIA.

BY JOHN MUIR.

ITS GENERAL CHARACTER.

IN the vast Sierra wilderness far to the southward of the famous Yosemite Valley, there is a yet grander valley of the same kind. It is situated on the south fork of King's River, above the most extensive groves and forests of the giant sequoia, and beneath the shadows of the highest mountains in the range, where the cañons are deepest and the snow-laden peaks are crowded most closely together. It is called the Big King's River Cañon, or King's River Yosemite, and is reached by way of Visalia, the nearest point on the Southern Pacific Railroad, from which the distance is about forty-five miles, or by the Kearsarge Pass from the east side of the range. It is about ten miles long, half a mile wide, and the stupendous rocks of purplish gray granite that form the walls are from 2500 to 5000 feet in height, while the depth of the valley below the general surface of the mountain mass from which it has been carved is considerably more than a mile. Thus it appears that this new Yosemite is longer and deeper, and lies embedded in grander mountains, than the well-known Yosemite of the Merced. Their general characters, however, are wonderfully alike, and they bear the same relationship to the fountains of the ancient glaciers above them.

As to waterfalls, those of the new valley are far less striking in general views, although the volume of falling water is nearly twice as great and comes from higher sources. The descent of the King's River streams is mostly made in the form of cascades, which are outspread in flat plume-like sheets on smooth slopes, or are squeezed in narrow-throated gorges, boiling, seething, in deep swirling pools, pouring from lin to lin, and breaking into ragged, tossing masses of spray and foam in boulder-choked cañons,—making marvelous mixtures with the downpouring sunbeams, displaying a thousand forms and colors, and giving forth a great variety of wild mountain melody, which, rolling from side to side against the echoing cliffs, is

at length all combined into one smooth, massy sea-like roar.

The bottom of the valley is about 5000 feet above the sea, and its level or gently sloping surface is diversified with flowery meadows and groves and open sunny flats, through the midst of which the crystal river, ever changing, ever beautiful, makes its way; now gliding softly with scarce a ripple over beds of brown pebbles, now rushing and leaping in wild exultation across avalanche rock-dams or terminal moraines, swaying from side to side, beaten with sunshine, or embowered with leaning pines and firs, alders, willows, and tall balsam poplars, which with the bushes and grass at their feet make charming banks. Gnarled snags and stumps here and there reach out from the banks, making cover for trout which seem to have caught their colors from rainbow spray, though hiding mostly in shadows, where the current swirls slowly and protecting sedges and willows dip their leaves.

From this long, flowery, forested, well-watered park the walls rise abruptly in plain precipices or richly sculptured masses partly separated by side cañons, displaying wonderful wealth and variety of architectural forms, which are as wonderful in beauty of color and fineness of finish as in colossal height and mass. The so-called war of the elements has done them no harm. There is no unsightly defacement as yet; deep in the sky, inviting the onset of storms through unnumbered centuries, they still stand firm and seemingly as fresh and unworn as new-born flowers.

From the brink of the walls on either side the ground still rises in a series of ice-carved ridges and basins, superbly forested and adorned with many small lakes and meadows, where deer and bear find grateful homes; while from the head of the valley mountains other mountains rise beyond in glorious array, every one of them shining with rock crystals and snow, and with a network of streams that sing their way down from lake to lake through a labyrinth of ice-burnished cañons. The area of the basins drained by the streams entering the valley is about 450 square miles, and the elevation of the rim of the general basin is from 9000 to

and September, 1890. A national park on the lines proposed by Mr. Muir was established by Act of Congress, dated October 1, 1890.—EDITOR.

¹ See also by the same writer "The Treasures of the Yosemite" and "Features of the Proposed Yosemite National Park," in THE CENTURY for August

upward of 14,000 feet above the sea; while the general basin of the Merced Yosemite has an area of 250 square miles, and its elevation is much lower.

When from some commanding summit we view the mighty wilderness about this central valley, and, after tracing its tributary streams, note how every converging cañon shows in its sculpture, moraines, and shining surfaces that it was once the channel of a glacier, contemplating this dark period of grinding ice, it would seem that here was a center of storm and stress to which no life would come. But it is just where the ancient glaciers bore down on the mountain flank with crushing and destructive and most concentrated energy that the most impressive displays of divine beauty are offered to our admiration. Even now the snow falls every winter about the valley to a depth of ten to twenty feet, and the booming of avalanches is a common sound. Nevertheless the frailest flowers, blue and gold and purple, bloom on the brows of the great cañon rocks,

and on the frosty peaks, up to a height of 13,000 feet, as well as in sheltered hollows and on level meadows and lake borders and banks of streams.

At the head of the valley the river forks, the heavier branch turning northward, and on this branch there is another yosemite, called from its flowery beauty Paradise Valley; and this name might well be applied to the main cañon, for notwithstanding its tremendous rockiness, it is an Eden of plant-beauty from end to end.

THE TRIP TO THE VALLEY.

SETTING out from Visalia we ride through miles and miles of wheat-fields, and grassy levels brown and dry and curiously dappled with low oval hillocks with miniature hollows between them called "hog-wallows"; then through tawny, sun-beaten foot-hills, with here and there a bush or oak. Here once roamed countless droves of antelope, now utterly exterminated. By the end of May most of the watercourses are dry. Feeble

bits of cultivation occur at long intervals, but the entire foot-hill region is singularly silent and desolate-looking, and the traveler fondly turns his eyes to the icy mountains looming through the hot and wavering air.

From the base of the first grand mountain plateau we can see the outstanding pines and sequoias 4000 feet above us, and we now ascend rapidly, sweeping from ravine to ravine around the brows of subordinate ridges. The vegetation shows signs of a cooler climate; the golden-flowered *Fremontia*, *manzanita*, *ceanothus*, and other bushes show miles of bloom; while great beds of blue and purple bells brighten the open spaces, made up chiefly of *brodiaea*, *calochortus*, *gilia* of many species, etc., the whole forming a floral apron of fine texture and pattern, let down from the verge of the forest in graceful, flowing folds. At a height of 3000 feet we find here and there a pine standing among the bushes by the wayside, lonely and far apart, as if it had come down from the woods to welcome us. As we continued to as-

cend the flower-mantle thickens, wafts of balsam come from the evergreens, fragrant tassels and plumes are shaken above us, cool brooks cross the road, till at length we enter the glorious forest, passing suddenly out of the sun glare into cooling shadows as if we had entered some grand inclosed hall.

We have now reached an elevation of 6000 feet, and are on the margin of the main forest belt of the Sierra. Looking down we behold the central plain of California outspread like an arm of the sea, bounded in the hazy distance by the mountains of the coast, and bathed in evening purple. Orange groves and vineyards, fields, towns, and dusty pastures are all submerged and made glorious in the divine light. Finer still is the light streaming past us through the aisles of the forest.

Down through the shadows we now make our way for a mile or two in one of the upper ravines of Mill Creek. Stumps, logs, and the smashed ruins of the trees cumber the ground; the scream of saws is heard; a lumber village comes in sight, and we arrive at the Moore and Smith Mills, the end of the stage line. From here the distance to the valley in a direct line is only about eighteen miles, and two trails lead to it, one of which traces the divide between the waters of the Kahweah and King's rivers, while the other holds a more direct course across the basins of Big and Little Boulder creeks, tributaries of King's River. Both ways are fairly good as mountain-trails go, inasmuch as you are seldom compelled to travel more than two miles to make an advance of one, and less than half of the miles are perpendicular. A stout walker may make the trip to the valley in a day. But if instead of crossing every ridge-wave of these broad boulder basins a good carriage-road were built around the brows and headlands of the main river cañon, the valley could be reached in less than half a day, and with the advantage of still grander scenery. The lower trail is the one commonly traveled, and upon the whole it is the more interesting, for it leads all the way through glorious forests, amid which the stately shafts and domes of sequoia are frequently seen. Climbing a steep mile from the

mill we enter the General Grant National Park of Big Trees, a square mile in extent, where a few of the giants are now being preserved amid the industrious destruction by ax, saw, and blasting-powder going on around them. Still ascending we pass the little flowery Round Meadow, set in a superb growth of silver firs, and gain the summit of the ridge that forms the west boundary of Little Boulder Creek Basin, from which a grand view of the forest is obtained,—cedar, sugar-pine, yellow pine, silver fir, and sequoia filling every hollow, and sweeping up the sides and over the top of every ridge in measureless exuberance and beauty, only a few gray rock brows on the southern rim of the basin appearing in all the sylvan sea.

We now descend to Bearskin Meadow, a sheet of purple-topped grasses enameled with

violets, gillias, larkspurs, potentillas, ivesias, columbine, etc.; parnassia and sedges in the wet places, and majestic trees crowding forward in proud array to form a curving border, while Little Boulder Creek, a stream twenty feet wide, goes humming and swirling merrily through the middle of it. Here we begin to climb again; ever up or down we go, not a fairly level mile in the lot. But despite the quick, harsh curves, vertical or horizontal, and the crossings of bogs and boulder-choked gullies, the sustained grandeur of the scenery keeps weariness away. The air is exhilarating. Crisp and clear comes the bold ringing call of the mountain quail, contrasting with the deep blunt bumping of the grouse, while many a small singer sweetens the air along the leafy fringes of the streams.

The next place with a name in the wilder-

ness is Tornado Meadow. Here the sequoia giants stand close about us, towering above the firs and sugar-pines. Then follows another climb of a thousand feet, after which we descend into the magnificent forest basin of Big Boulder Creek. Crossing this boisterous stream as best we may, up again we go 1200 feet through glorious woods, and on a few miles to the emerald Horse Corral and Summit Meadows, a short distance beyond which the highest point on the trail is reached at Grand Lookout, 8300 feet above the sea. Here at length we gain a general view of the great cañon of King's River lying far below, and of the vast mountain-region in the sky on either side of it, and along the summit of the range. [See p. 81.] Here too we see the forest in broad dark swaths still sweeping onward undaunted, climbing the farther mountain-slopes to a height of 11,000 feet. But King Sequoia comes not thus far. The grove nearest the valley is on one of the eastern branches of Boulder Creek, five miles from the lower end.

CHIEF FEATURES OF THE CAÑON.

GOING down into the valley we make a descent of 3500 feet, over the south shoulder, by a careless crinkled trail which seems well-nigh endless. It offers, however, many fine points of view of the huge granite trough, and the river, and the sublime rocks of the walls plunging down and planting their feet on the shady level floor. [See p. 83.]

At the foot of the valley we find ourselves in a smooth spacious park, planted with stately groves of sugar-pine, yellow pine, silver fir, incense-cedar, and Kellogg oak. The floor is scarcely ruffled with underbrush, but myriads of small flowers spread a thin purple and yellow veil over the brown needles and burrs beneath the groves, and the gray ground of the open sunny spaces. The walls lean well back and support a fine growth of trees, especially on the south side, interrupted here and there by sheer masses 1000 to 1500 feet high, which are thrust forward out of the long slopes like dormer windows. [See p. 85.] Three miles up the valley on the south side we come to the Roaring Falls and Cascades. They are on a large stream called Roaring River, whose tributaries radiate far and wide and high through a magnificent basin back into the recesses of a long curving sweep of snow-laden mountains. But though the waters of Roaring River from their fountains to the valley have an average descent of nearly five hundred feet per mile, the fall they make in getting down into the valley is insignificant in height as compared with the similarly situated Bridal Veil of the old Yosemite. The height of the fall does not greatly

exceed its width. There is one thundering plunge into a dark pool beneath a glorious mass of rainbow spray, then a boisterous rush with divided current down a boulder delta to the main river in the middle of the valley. But it is the series of wild cascades above the fall which most deserves attention. For miles back from the brow of the fall the strong, glad stream, five times as large as the Bridal Veil Creek, comes down a narrow cañon or gorge, speeding from form to form with most admirable exuberance of beauty and power, a multitude of small sweet voices blending with its thunder tones as if eager to assist in telling the glory of its fountains. On the east side of the fall the Cathedral Rocks spring aloft with imposing majesty. They are remarkably like the group of the same name in the Merced Yosemite and similarly situated though somewhat higher.

Next to Cathedral Rocks is the group called the Seven Gables, massive and solid at the base, but elaborately sculptured along the top and a considerable distance down the front into pointed gothic arches, the highest of which is about three thousand feet above the valley. Beyond the Gable Group, and separated slightly from it by the beautiful Avalanche Cañon and Cascades, stands the bold and majestic mass of the Grand Sentinel, 3300 feet high, with a split vertical front presented to the valley, as sheer, and nearly as extensive, as the front of the Yosemite Half Dome.

Projecting out into the valley from the base of this sheer front is the Lower Sentinel, 2400 feet high; and on either side, the West and East Sentinels, about the same height, forming altogether the boldest and most massively sculptured group in the valley. Then follow in close succession the Sentinel Cascade, a lace-like strip of water 2000 feet long; the South Tower, 2500 feet high; the Bear Cascade, longer and broader than that of the Sentinel; Cave Dome, 3200 feet high; the Sphinx, 4000 feet, and the Leaning Dome, 3500. The Sphinx, terminating in a curious sphinx-like figure, is the highest rock on the south wall, and one of the most remarkable in the Sierra; while the whole series from Cathedral Rocks to the Leaning Dome at the head of the valley is the highest, most elaborately sculptured, and the most beautiful series of rocks of the same extent that I have yet seen in any Yosemite in the range.

Turning our attention now to the north wall, near the foot of the valley a grand and impressive rock presents itself, which with others of like structure and style of architecture is called the Palisades. Measured from the immediate brink of the vertical portion of the front, it is about two thousand feet high, and is gashed from top to base by vertical planes, making

GENERAL VIEW OF KING'S RIVER CANON, FROM GRAND LOOKOUT.

it look like a mass of huge slabs set on edge. Its position here is relatively the same as that of El Capitan in Yosemite, but neither in bulk nor in sublime boldness of attitude can it be regarded as a rival of that great rock.

The next notable group that catches the eye in going up the valley is the Hermit Towers, and next to these the Three Hermits, forming together an exceedingly picturesque series of complicated structure, slightly separated by the steep and narrow Hermit Cañon. The Hermits stand out beyond the general line of the wall, and in form and position remind one of the Three Brothers of the Yosemite Valley.

East of the Hermits a stream about the size of Yosemite Creek enters the valley, forming the Booming Cascades. It draws its sources from the southern slopes of Mount Hutchings and Mount Kellogg, 11,000 and 12,000 feet high, on the divide between the middle and south forks of the King's River. In Avalanche Cañon, directly opposite the Booming Cascades, there is another brave bouncing chain of cascades, and these two sing and roar to each other across the valley in hearty accord. But though on both sides of the valley, and up the head cañons, water is ever falling in glorious abundance and from immense heights, we look in vain for a stream shaken loose and free in the air to complete the glory of this grandest of yosemites. Nevertheless when we trace these cascading streams through their picturesque cañons, and behold the beauty they show forth as they go plunging in short round-browed falls from pool to pool, laving and plashing their sun-beaten foam-bells; gliding outspread in smooth shining plumes, or rich ruffled lace-work fold over fold; dashing down rough places in wild ragged aprons, dancing in upbulging bosses of spray, the sweet brave ouzel helping them to sing, and ferns, lilies, and tough-rooted bushes shading and brightening their gray rocky banks,—when we thus draw near and learn to know these cascade falls, which thus keep in touch with the rocks, and plants, and birds, then we admire them even more than those which leave their channels and fly down through the air.

Above the Booming Cascades, and opposite the Grand Sentinel, stands the North Dome, 3450 feet high. [See p. 87.] It is set on a long bare granite ridge, with a vertical front like the Washington Column in Yosemite. Above the Dome the ridge still rises in a finely drawn curve, until it reaches its culminating point in the pyramid, a lofty symmetrical rock nearly 6000 feet above the floor of the valley.

A short distance east of the Dome is Lion Rock, a very striking mass as seen from a favorable standpoint, but lower than the main rocks of the wall, being only about 2000 feet

high. Beyond the Lion, and opposite the East Sentinel, a stream called Copper Creek comes chanting down into the valley. It takes its rise in a cluster of beautiful lakes that lie on top of the divide between the South and Middle Forks of King's River, to the east of Mount Kellogg. The broad, spacious basin it drains abounds in beautiful groves of spruce and silver fir, and small meadows and gardens, where the bear and deer love to feed, but it has been sadly trampled by flocks of sheep.

From Copper Creek to the head of the valley the precipitous portion of the north wall is comparatively low. The most notable features are the North Tower, a square, boldly sculptured outstanding mass two thousand feet in height, and the Dome arches, heavily glaciated, and offering telling sections of domed and folded structure. [See p. 91.] At the head of the valley, in a position corresponding to that of the Half Dome in Yosemite, looms the great Glacier Monument, the broadest, loftiest, and most sublimely beautiful of all these wonderful rocks. It is upward of a mile in height, and has five ornamental summits, and an indescribable variety of sculptured forms projecting or countersunk on its majestic front, all balanced and combined into one symmetrical mountain mass. [See p. 89.]

THE VALLEY FLOOR.

THE bottom of the valley is covered by heavy deposits of moraine material, mostly outspread in comparatively smooth and level beds, though four well-characterized terminal moraines may still be traced stretching across from wall to wall, dividing the valley into sections. These sections, however, are not apparent in general views. Compared with the old Yosemite this is a somewhat narrower valley, the meadows are smaller, and fewer acres if cultivated would yield good crops of fruit or grain. But on the other hand the tree-growth of the new valley is much finer; the sugar-pine in particular attains perfect development, and is a hundred times more abundant, growing on the rough taluses against the walls, as well as on the level flats, and occupying here the place that the Douglass spruce occupies in the old valley. Earthquake taluses, characteristic features of all yosemites, are here developed on a grand scale, and some of the boulders are the largest I have ever seen—more than a hundred feet long, and scarcely less in width and depth.

With the exception of a small meadow on the river bank, a mile or more of the lower end of the valley is occupied by delightful groves, and is called Deer Park. Between Deer Park and the Roaring Fall lies the Manzanita Or-

GENERAL VIEW OF THE CAÑON, LOOKING EAST.

chard, consisting of a remarkably even and extensive growth of manzanita bushes scarcely interrupted by other bushes or by trees. Beyond the Roaring Fall the soil-beds are rather rocky, but smooth sheets occur here and there, the most notable of which is Blue Flat, covered with blue and fragrant lupines; while all the boulder-beds are forested with noble pines and firs.

The largest meadow in the valley lies at the foot of the Grand Sentinel. It is noted for its fine growth of sweet-brier rose, the foliage of which as well as the flower is deliciously fragrant, especially in the morning when the sun warms the dew. At the foot of the South Tower, near the Bear Cascades, there is a notable garden of Mariposa tulips, and above this garden lies Bear Flat, extending to the head of the valley. It is a rather rough, bouldery space, but well planted, and commands glorious views of all the upper end of the valley.

On the north side of the valley the spaces that bear names are the Bee Pasture, Gilia Garden, and Purple Flat, all lavishly flowery, each with its own characteristic plants, though mostly they are the same as those of the south side of the river, variously developed and combined; while aloft on a thousand niches, benches, and recesses of the walls are charming rock-ferns, such as *adiantum*, *pellaea*, *cheilanthes*, *allosorus*, etc., and brilliant rugs and fringes of the alpine phlox, *Menzies pentstemon*, *bryanthus*, *Cassiope*, alpine *primula*, and many other small floral mountaineers.

In passing through the valley the river makes an average descent of about fifty feet per mile. Down the cañon below the valley the descent is 125 feet per mile for the first five miles, and of course the river is here one continuous chain of rapids. And here too are several beautiful falls on streams entering the cañon on both sides, the most attractive of which is on Boulder Creek, below a fine grove.

TYNDALL CAÑON.

At the head of the valley in front of the monument the river divides into two main branches, the larger branch trending northward through Paradise Cañon, the other eastward through Tyndall Cañon, and both extend back with their wide-reaching tributaries into the High Sierra among the loftiest snow-mountains of the range, and display scenery along their entire courses harmoniously related to the grand gorge. Tracing the Tyndall Cañon we find that its stream enters the valley in a most beautiful and enthusiastic cascade, which comes sweeping around the base of the Monument, and down through a bower of maple, dogwood, and tall leaning evergreens, making a fall of nearly

eight hundred feet. A few miles above the valley the declivity of the cañon is moderate, and nowhere does it expand into meadows of considerable width, or levels of any kind, with the exception of a few small lake-basins. But the walls are maintained in yosemite style, and are striped with cascades and small sheer falls from 1000 to 2500 feet in height. In many places the cañon is choked with the boulders of earthquake avalanches, and these, being overgrown with tangled bushes, make tedious work for the mountaineer, though they greatly enhance the general wildness. Pursuing the upper south fork of the cañon past Mount Brewer, the scenery becomes more and more severely rocky, and the source of the young river is found in small streams that rise in the spacious snow-fountains of Mount Tyndall and the neighboring peaks.

PARADISE CAÑON.

RETURNING now to the main valley and ascending the Paradise Cañon we find still grander scenery, at least for the first ten miles. Beneath the shadow of the Glacier Monument, situated like Mirror Lake beneath the Half Dome of Yosemite, is a charming meadow with magnificent trees about it, and huge avalanche taluses tangled with *ceanothus* and *manzanita* and wild cherry, a favorite pasture and hiding-place for bears; while the river with broad, stately current sweeps down through the solemn solitude. Pursuing our savage way through the stubborn underbrush, and over or beneath boulders as large as hills, we find the noble stream beating its way for five or six miles in one continuous chain of roaring, tossing, surging cascades and falls. The walls of the cañon on either hand rise to a height of from 3000 to 5000 feet in majestic forms, hardly inferior in any respect to those of the main valley. The most striking of these on the west wall is the Helmet, four thousand feet in height; and on the east side, after the Monument, Paradise Peak. [See p. 92.] Of all the grand array only these have yet been named. About eight miles up the cañon we come to Paradise Valley, where the walls, still maintaining their lofty yosemite characters, especially on the east side, stand back and make space for charming meadows and gravelly flats, while one grand fall not yet measured, and several smaller ones, pouring over the walls, give voice and animation to the glorious mountain solitude.

A SUMMER SCENE.

How memorable are these Sierra experiences! Descending one day from the depths of the upper forest we rambled enchanted through the sugar-pine groves of Deer Park. Never did

LOOKING UP THE VALLEY FROM THE MANZANITA ORCHARD.

pinces seem more noble and devout in all their gestures and tones. The sun, pouring down floods of mellow light, seemed to be thinking only of them, and the wind gave them voice; but the gestures of their outstretched arms seemed independent of the wind, and impressed us with solemn awe as if we were strangers in a new world. Near the Roaring Fall we came to a little circular meadow which was one of the most perfect gardens I ever saw. It was planted with lilies and orchids, larkspurs and columbines, daisies and asters, and sun-loving golden-rods, violets, brier-roses, and purple geranium, and a hundred others whose names no one would care to read, though everybody would surely love them at first sight. One of the lilies (*L. Columbianum*) was six feet high and had eleven open flowers, five of them in their prime. The wind sifting through the trees rocked this splendid panicle above the rose-bushes and geraniums in exquisite poise. It was as if nature had fingered every leaf and petal that very day, readjusting every curving line and touching the colors of every corolla. Not a leaf, as far as I could see, was misbent, and every plant about it was so placed with reference to every other that the whole meadow-garden seemed to have been thoughtfully arranged like a tasteful bouquet. Bees and humming-birds made a pleasant stir, and the little speckle-breasted song-sparrow sang in the bushes near by, working dainty lines of embroidery on the deep, bossy tones of the fall, while the great rocks looked down as if they, too, were considering the lilies and listening to the music of their bells. That memorable day died in purple and gold, and just as the last traces of the sunset faded in the west and the star-lilies filled the sky, the full moon looked down over the rim of the valley, and the great rocks, catching the silvery glow, came forth out of the dusky shadows like very spirits.

FROM YOSEMITE TO KING'S RIVER ALONG THE SIERRA.

ONE of my visits to the great cañon was undertaken from the old Yosemite along the Sierra, and I was so fortunate as to get into the valley when it was arrayed in the gay colors of autumn. I was eager also to see as much as possible of the High Sierra at the head of it, and of the wild mountain region between the two great yosemites. Had I gone afoot and alone as usual, I should have had a glorious time, with nothing to do but climb and enjoy. But I took a party, and mules, and horses, which caused much trail-making and miserable carnal care. We followed the old trail to Wawona and the Mariposa sequoias, then plunged into the trackless wilder-

ness. We traced the Chiquita Joaquin to its head, then crossed the cañon of the North Fork of the San Joaquin below the yosemite of this branch, and made our way southward across the Middle and South Forks of the San Joaquin, to a point on the divide between the South Fork of the San Joaquin and the North Fork of King's River, 10,000 feet above the sea. Here I left the weary party and the battered animals in camp to rest, while I made a three days' excursion to Mount Humphrey, on the summit of the range, from the top of which, at an elevation of about 14,000 feet, I obtained, to the southward, grand general views of the thick crowd of peaks gathered about the headwaters of the three forks of King's River, and northward over those of the San Joaquin. Returning to camp after my fine ramble, rich in glaciers, glacier-lakes, glacier-meadows, etc., I climbed the divide above the camp with the other mountaineer of our party to gain another view of the King's River country with reference to our farther advance. The view was truly glorious—peaks, domes, huge ridges, and a maze of cañons in bewildering combinations— but terribly forbidding as to way-making. My companion gazed over the stupendous landscape in silence, then sighed and said he must go home, and accordingly he left us next morning. I had still two companions and four animals to make a way for. Pushing on with difficulty over the divide, we entered the upper valley of the North Fork of King's River, and traced its course through many smooth glacier-meadows, and past many a beautiful cluster of granite domes, developed and burnished by the ancient glaciers. Below this dome region the cañon closed, and we were compelled to grope our way along its forest-clad brink until we discovered a promising side-cañon, which led us down into the North Fork yosemite, past a massive projecting rock like El Capitan. This valley is only about two thousand feet in depth, and of no great extent, but exceedingly picturesque and wild. The level floor was planted with beautiful groves of live oak, pine, libocedrus, etc., and a profusion of Yosemite flowers, of which the large tiger-lily (*L. pardalinum*) is the most showy. The river enters the valley in a chain of short falls and cascades through a narrow gorge at the head, where there is a mirror lake with beautiful shores.

After resting and sketching awhile we at length made a way out of this little yosemite by a rude trail that we built up a gorge of the south wall, and on to the crest of the divide between the North and Middle Forks of the river. Here we gained telling views of the region about the head of the Middle Fork of King's River,—vast mountains along the axis of the range, seemingly unapproachable, a broad map

VIEW FROM TALUS AT FOOT OF NORTH DOME, LOOKING UP THE VALLEY.

of domes and huge ridge-waves and cañons extending from the summits far to the west of us in glorious harmony. Tracing the divide through magnificent forests we at length forded the main King's River, passed through the sequoia groves, and entered the great Yosemite on the 9th of October, after a light storm had freshened the colors. With the exception of a few late-blooming goldenrods, gentians, and erigerons, the plants had gone to seed; but the ripened leaves, frost-nipped, wrinkled and ready to fall, made gorgeous clouds of color, which burned in the mellow sunshine like the bloom of a richer summer. The Kellogg oak, willows, aspen, balm-of-Gilead, and the large-leaved maple were yellow; the mountain maple and dogwood red, and the meadow ferns and general mass of the small plants purple and brown. The river gently gliding amid so much colored foliage was surpassingly beautiful, every reach a picture; while the hazy Indian Summer light streaming over the walls softened the harsh angles of the rocks, and greatly enhanced their solemn grandeur and impressiveness. Rambling through the valley we found the squirrels busy gathering their winter stores of pine-nuts. All the nests in the groves were empty, and the young birds were as big as the old ones, and ready to fly to warmer climates. The deer were coming down from the upper thickets on their way to the chaparral of the foot-hills, while the bears were eating acorns and getting themselves fat enough to "hole up." Everything seemed to know that before long the storm trumpets would sound, announcing the end of summer and the beginning of winter.

At the Sentinel Meadow we found a mountaineer who had come across the range by the Kearsarge Pass to catch trout for the purpose of stocking a number of small streams that pour down the east flank of the range into Owens Valley. He said the settlers there had raised five hundred dollars for this purpose. By turning the courses of the smaller streams of the valley he caught large numbers in the shallows and put them into tin cans to be transported on mules. He had already carried a train-load over the pass, and said that by frequently changing the water at the many streams and lakes on the way, nearly all the trout were kept alive to the end of their long and novel excursion.

Leaving the lively mountaineer with his mules and fishes, we pushed on up the Tyndall cañon by the Kearsarge trail to the first tributary that enters from the north. Here I again left the party in camp to climb Mount Tyndall. Returning in two days, I found that they had gone up the trail, taking everything with them, so that, weary as I was, without food or blankets, I was compelled to go on in

pursuit. I overtook them in the pass at sundown, and when I asked why they had left me, they said they feared I would never return and that they too would be lost. They had simply lost their wits as soon as they were left alone. At the foot of the pass I again left the party, directing them to follow the trail to Fort Independence, and wait there in civilized safety while I turned southward along the base of the range to climb Mount Whitney.

From Independence we skirted the eastern flank of the range northward to Mono, passing many a flood of lava and cluster of volcanic cones, and gaining long, sweeping views of the High Sierra from the sage plains. From Mono I still held on northward through Faith, Hope, and Charity Valleys to Tahoe, walked around that queen of Sierra lakes, returned to Mono, climbed Bloody Cañon, went down through the delightful Tuolumne Meadows, down through the junipers of Clouds' Rest, down through the firs, and into Yosemite again, thus completing one of the wildest and most interesting trips conceivable.

DESTRUCTIVE TENDENCIES.

At first sight it would seem that these mighty granite temples could be injured but little by anything that man may do. But it is surprising to find how much our impressions in such cases depend upon the delicate bloom of the scenery, which in all the more accessible places is so easily rubbed off. I saw the King's River valley in its midsummer glory sixteen years ago, when it was wild, and when the divine balanced beauty of the trees and flowers seemed to be reflected and doubled by all the onlooking rocks and streams as though they were mirrors, while they in turn were mirrored in every garden and grove. In that year (1875) I saw the following ominous notice on a tree in the King's River Yosemite:

We, the undersigned, claim this valley for the purpose of raising stock.

MR. THOMAS,
MR. RICHARDS,
HARVEY & CO.

and I feared that the vegetation would soon perish. This spring (1891) I made my fourth visit to the valley, to see what damage had been done, and to inspect the forests. Besides, I had not yet seen the valley in flood, and this was a good flood year, for the weather was cool, and the snow on the mountains had been held back ready to be launched. I left San Francisco on the 28th of May, accompanied by Mr. Robinson, the artist. At the new King's River Mills we found that the sequoia giants, as well as the pines and firs, were being ruthlessly

turned into lumber. Sixteen years ago I saw five mills on or near the sequoia belt, all of which were cutting more or less of "big-tree" lumber. Now, as I am told, the number of mills along the belt in the basins of the King's, Kaweah, and Tule rivers is doubled, and the capacity more than doubled. As if fearing restriction of some kind, particular attention is being devoted to the destruction of the sequoia groves owned by the mill companies, with the view to get them made into lumber and money before steps can be taken to save them. Trees which compared with mature specimens are mere saplings are being cut down, as well as the giants, up to at least twelve to fifteen feet in diameter. Scaffolds are built around the great brown shafts above the swell of the base, and several men armed with long saws and axes gnaw and wedge them down with damnable industry. The logs found to be too large are blasted to manageable dimensions with powder. It seems incredible that Government should have abandoned so much of the forest cover of the mountains to destruction. As well sell the rain-clouds, and the snow, and the rivers, to be cut up and carried away if that were possible. Surely it is high time that something be done to stop the extension of the present barbarous, indiscriminating method of harvesting the lumber crop.

At the mills we had found Mr. J. Fox, bear-killer and guide, who owns a pack train, and keeps a small store of provisions in the valley for the convenience of visitors. This sturdy mountaineer we engaged to manage our packs, and under his guidance after a very rough trip we reached our destination late at night.

Arrived in the valley, we found that the small grove (now under Government protection) has been sadly hacked and scarred by campers and sheep-owners, and it will be long before it recovers anything like the beauty of its wildness.

Several flocks of sheep are driven across the river at the foot of the valley every spring to pasture in the basins of Kellogg and Copper creeks. On the south side of the valley, in the basin of Roaring River, more than 20,000 sheep are pastured, but none have ever been allowed to range in the valley.

GAME AND SPORT.

AFTER breakfast two anglers with whom we had fallen in on the way set forth to a big jam of flood timber on the south side of the river, and amid its shady swirls and ripples bagged the glittering beauties as fast as sham flies could be switched to them, a hundred trout of a morning being considered no uncommon catch under favorable conditions of water and sky. This surely is the most romantic fishing-ground in

the world. Nearly all the visitors to the valley are hunters or anglers; they number about four hundred a year, and nearly all come from Owens Valley on the eastern slope of the Sierra, or from the Visalia Plains. By means of ropes and log foot-bridges we got across the three streams of Roaring River, and, passing through the fragrant lupine garden of Blue Flat, which Fox calls the Garden of Eden, we made our permanent camp in a small log cabin on the edge of the meadow at the foot of the Grand Sentinel.

The fauna of the valley is diverse and interesting. The first morning after our arrival I saw the black-headed grosbeak, the Louisiana tanager, and Bullock's oriole, whose bills must still have been stained by the cherries of the lowland orchards. I also noticed many species of woodpeckers, including the large log-cock (*Hylotomus pileatus*) and innumerable finches and fly-catchers. The mountain quail and grouse also dwell in the valley, as well as in all the silver-fir woods on the surrounding heights. The large California graysquirrel, as well as the Douglass, is seldom out of sight as one saunters through the groves, and in the cabin we were favored with the company of wood-rats. These amusing animals made free with our provisions, bathed in our water-bucket, and ran across our faces in the night.

Besides our party there were two other persons in the valley, who had arrived a few days before us: a young student whose ambition was to kill a bear, and his uncle, a tough, well-seasoned mountaineer who had roamed over the greater part of the western wilderness. The boy did kill a bear a few days after our arrival, not so big and ferocious a specimen as he could have wished, but formidable enough for a boy to fight single-handed. It was jet-black, sleek, and becomingly shaggy; with teeth, claws, and muscles admirably fitted for the rocky wilderness. After selecting certain steaks, roasts, and boiling-pieces, the remainder of the lean meat was cut into ribbons and strung about the camp to dry, while the precious oil was put into cans and bottles. Bread at that camp was now made of flour and bear oil, instead of flour and water, and bear muffins, bear flapjacks, and bear shortbread were the order of the day.

The black bear is seldom found to the north of King's River. Of the other two species,—the cinnamon and grizzly,—the former is more common. But all the species are being rapidly reduced in numbers. From city hunters bears have little to fear, but many fall before the rifles of the mountaineer and prospector. Shepherds poison, and even shoot, many in the aggregate every year. Pity that animals so good-natured and so much a part of these shaggy wilds should be exterminated. If all the King's River bears

NORTH TOWER, FROM TALUS SLOPE AT FOOT OF GLACIER MONUMENT.

PARADISE PEAK, LOOKING EAST FROM SLOPES AT FOOT OF THE HELMET.

great and small were gathered into this favorite yosemite home of theirs, they would still make a brave show, but they would probably number fewer than five hundred.

EXCURSIONS FROM THE VALLEY.

THE side and head cañons of the valley offer ways gloriously rugged and interesting back into the High Sierra. The shorter excursions to points about the rim of the valley, such as Mt. Kellogg, Mt. Brewer, the North Dome, the Helmet, Avalanche Peak, and the Grand Sentinel, may be made in one day. Bear-trails will be found in all the cañons leading up to these points, and may be safely followed, and throughout them all and on them all glorious views will be obtained.

The excursion to Avalanche Peak by way of Avalanche Cañon and the Grand Sentinel is one of the most telling of the short trips about the valley, and one that every visitor should make, however limited as to time. From the top of the Sentinel the bottom of the valley, with all its groves and meadows and nearly all of the walls on both sides, is seen, while Avalanche Peak commands a view of nearly all the magnificent basin of Roaring River, and of the region tributary to the valley on the north and east. A good bear-trail guides you through the cherry brush and boulders along the cascades. A thousand feet above the valley you come to the beautiful Diamond Fall, 200 feet high and 40 feet wide. About a thousand feet higher a small stream comes in from the east, where you turn to the left and scale the side of the cañon to the top of the Grand Sentinel. After gazing up and down into the tremendous scenery displayed here, you follow the Sentinel ridge around the head of the beautiful forested basin, into which the cañon expands, to the summit of the peak. In spring the Avalanche basin and cañon are filled with compact avalanche snow, which lies long after the other cañons are clear. In June last I slid comfortably on the surface of this snow from the peak down nearly to the foot of the Diamond Fall, a distance of about two miles. Of course this can only be done when the surface is in a melting condition or is covered with fresh snow. In April one might slide from the summit to the bottom of the valley, making a fall of a mile in one swift swish above the rocks, logs, and brush that roughen the way in summer.

MTS. TYNDALL, KEARSARGE, AND WHITNEY.

THE excursion to Mt. Tyndall from the valley and return requires about three days. You trace the east branch of the river from the

head of the valley until it forks, then trace the South Fork past the east side of Mt. Brewer until it divides into small streams, then push up eastward as best you can to the summit. The way is rather rough, but the views obtained of the loftiest and broadest portion of the High Sierra are the most comprehensive and awe-inspiring that I know of. It is here that the great western spur on Greenhorn Range strikes off from the main axis to the southwest and south, bearing a noble array of snowy mountains, and forming the divide between the Upper Kern on the east and the Kaweah and Tule rivers on the west, while the main chain forms the eastern boundary of the basin of the Kern. Northward the streams fall into King's River, eastward into Owens Valley and the dead salt Owens Lake, lying in the glare of the desert 9000 feet below you. To the north and south far as the eye can reach you behold a vast crowded wilderness of peaks, only a few of which are named as yet. Mt. Kearsarge to the northward, a broad round-shouldered mountain on the main axis at the head of the pass of that name; Mt. Brewer, noted for the beauty of its fluted slopes; Mt. King, an exceedingly sharp and slender peak a few miles to the eastward of the Glacier monument, and Mt. Gardiner, a companion of King. Within two miles of where you stand rises the jagged mass of Mt. Williamson, a little higher than Tyndall, or 14,300 feet, and seven miles to the southward rises Mt. Whitney, 14,700 feet high, the culminating point of the range, and easily recognized by its helmet-shaped peak facing eastward. Though Mt. Whitney is a few hundred feet higher than Tyndall, the views obtained from its summit are not more interesting. Still, because it is the highest of all, every climber will long to stand on its topmost crag. Some eighteen years ago I spent a November night on the top of Whitney. The first winter snow had fallen and the cold was intense. Therefore I had to keep in motion to avoid freezing. But the view of the stars and of the dawn on the desert was abundant compensation for all that. This was a hard trip, but in summer no extraordinary danger need be encountered. Almost any one able to cross a cobblestoned street in a crowd may climb Mt. Whitney. I climbed it once in the night, lighted only by the stars. From the summit of Mt. Tyndall you may descend into Kern Valley and make direct for Mt. Whitney, thus including both of these lordly mountains in one excursion, but only mountaineers should attempt to go this gait. A much easier way is to cross the range of the Kearsarge Pass, which, though perhaps the highest traveled pass on the continent, being upward of 12,000 feet above the sea, is not at all dangerous. The trail from the valley

TEHIPITEE DOME, UPPER END OF TEHIPITEE VALLEY (MIDDLE FORK OF KING'S RIVER).

leads up to it along extensive meadows and past many small lakes over a broad plateau, and the views from there are glorious. But on the east side the descent to the base of the range is made in one tremendous swoop through a narrow cañon. Escaping from the shadowy jaws of the cañon you turn southward to Lone Pine. Then by taking the Hackett trail up Cottonwood Cañon you pass over into Kern Valley and approach the mountain from the west, where the slopes are easy, and up which you may ride a mule to a height of 12,000 feet, leaving only a short pull to the summit. But for climbers there is a cañon which comes down from the north shoulder of the Whitney peak. Well-seasoned limbs will enjoy the climb of 9000 feet required by this direct route. But soft, succulent people should go the mule way.

THE TEHIPITEE VALLEY.

THE King's River Cañon is also a good starting point for an excursion into the beautiful and interesting Tehipitee Valley, which is the yosemite of the Middle Fork of King's River. By ascending the valley of Copper Creek, and crossing the divide, you will find a Middle Fork tributary that conducts by an easy grade down into the head of the grand Middle Fork Cañon, through which you may pass in time of low water, crossing the river from time to time, where sheer headlands are brushed by the current, leaving no space for a passage. After a long rough scramble you will be delighted when you emerge from the narrow bounds of the great cañon into the spacious and enchantingly beautiful Tehipitee. It is about three miles long, half a mile wide, and the walls are from 2500 to nearly 4000 feet in height. The floor of the valley is remarkably level, and the river flows with a gentle and stately current. Nearly half of the floor is meadow-land, the rest sandy flat planted with the same kind of trees and flowers as the same kind of soil bears in the great cañon, forming groves and gardens, the whole inclosed by majestic granite walls which in height, and beauty, and variety of architecture are not surpassed in any yosemite of the range. Several small cascades coming from a great height sing and shine among the intricate architecture of the south wall, one of which when seen in front seems to be a nearly continuous fall about two thousand feet high. [See p. 96.] But the grand fall of the valley is on the north side, made by a stream about the size of Yosemite Creek. This is the Tehipitee Fall, about 1800 feet high. The upper portion is broken up into short falls and magnificent cascade dashes, but the last plunge is made over a sheer precipice about four hundred feet in height into a beautiful pool.

To the eastward of the Tehipitee Fall stands Tehipitee Dome, 2500 feet high, a gigantic round-topped tower, slender as compared with its height, and sublimely simple and massive in structure. It is not set upon, but against, the general masonry of the wall, standing well forward, and rising free from the open sunny floor of the valley, attached to the general mass of the wall rocks only at the back. This is one of the most striking and wonderful rocks in the Sierra. [See p. 94.]

I first saw this valley in 1875 when I was exploring the sequoia belt, and again two years later when I succeeded in tracing the Middle Fork cañon all the way down from its head. I pushed up the cañon of the South Fork in November when the streams were low, through the great cañon, and crossed the divide by way of Copper Creek. The weather was threatening, and at midnight while I lay under a tree on the summit I was awakened by the terribly significant touch of snow on my face. I arose immediately, and while the storm-wind made wild music I pushed on over the divide in the dark, feeling the way with my feet. At day-break I found myself on the brink of the main Middle Fork Cañon, and in an hour or two gained the bottom of it, and pushed down along the river-bank below the edge of the storm-cloud. After crossing and recrossing the river again and again, and breaking a way through chaparral and boulders, with here and there an open spot gloriously painted with the colors of autumn, I at length reached Tehipitee. I was safe; for all the ground was now familiar. The storm was behind me. The sun was shining clear, shedding floods of gold over the tinted meadows, and fern-flats, and groves. The valley was purely wild. Not a trace, however faint, could I see of man or any of his animals, but of nature's animals many. I had been out of provisions for two days, and at least one more hunger-day was before me, but still I lingered sketching and gazing enchanted. As I sauntered up to the foot of Tehipitee Fall a fat buck with wide branching antlers bounded past me from the edge of the pool within a stone's-throw, and in the middle of the valley he was joined by three others, making fine romantic pictures as they crossed the sunny meadow.

A mile below the fall I met a grizzly bear eating acorns under one of the large Kellogg oaks. He either heard my crunching steps on the gravel or caught scent of me, for a few minutes after I saw him he stopped eating and came slowly lumbering toward me, stopping every few yards to listen. I was a little afraid, and stole slowly off to one side, and crouched back of a large libocedrus tree. He came on within a dozen yards of me, and I had a good

PART OF SOUTH WALL OF TENIPITEE VALLEY.

quiet look into his eyes—the first grizzly I had ever seen at home. Turning his head he chanced to catch sight of me; after a long studious stare, he good-naturedly turned away and wallowed off into the chaparral. So perfectly wild and romantic was Tehipitee in those days. Whether it remains unchanged I cannot tell, for I have not seen it since.

THE NEED OF ANOTHER GREAT NATIONAL PARK.

I FANCY the time is not distant when this wonderful region will be opened to the world—when a road will be built up the South Fork of King's River through the sequoia groves, into the great cañon, and thence across the divide and down the Middle Fork Cañon to Te-

hipitee; thence through the valley and down the cañon to the confluence of the Middle and South Forks, and up to the sequoia groves to the point of beginning. Some of the sequoia groves were last year included in the national reservations of Sequoia and General Grant Parks. But all of this wonderful King's River region, together with the Kaweah and Tule sequoias, should be comprehended in one grand national park. This region contains no mines of consequence, it is too high and too rocky for agriculture, and even the lumber industry need suffer no unreasonable restriction. Let our law-givers then make haste before it is too late to set apart this surpassingly glorious region for the recreation and well-being of humanity, and all the world will rise up and call them blessed.

John Muir.

[The illustrations of this article were drawn by Charles D. Robinson from nature or from sketches from nature made by himself or, in three instances, by Mr. Muir.—EDITOR.]

A THEFT CONDONED.

NE of the seven houses in Pawnee faced toward the south. It was the house where Mrs. Dyer lived. The other houses faced the west. The railroad track was across the street from these houses, with a broad plank walk and

a little unpainted box of a station.

The houses in Pawnee were all one-story wooden buildings, with the gable-ends toward the street. Mrs. Dyer's house was painted a dull red; the other houses were not painted.

It had been a warm day and the sun had shone glaringly on the unbroken prairie around Pawnee.

The town was on a slight rise of ground. You could see more than twenty miles in three directions. A narrow strip of woods broke the view on the north, half a mile away.

Mrs. Dyer stood in her front door and looked off over the prairie. The railroad track wound away toward the south and disappeared where the earth and sky seemed to meet. The sun was going down and the short thin prairie-grass looked white and gold. The railroad track shone like silver. There were no clouds. In places the blue of the sky was so light that it was almost white. The air was cool and clear after the warm day.

"The sun's going down without any fuss to-night," Mrs. Dyer said, sitting down on the doorstep. "Just droppin' off the edge, like the string that held it had been cut."

She folded her arms in her lap and turned her face away from the bright light. She was a small, old woman with thin features. She wore her hair, which was still very black, combed smoothly behind her ears. Her eyes were black, with a keen look of resistance in them. This look was emphasized in the lines around her mouth.

Mrs. Dyer lived alone. Her son kept a little store and the post-office in the front room of one of the other houses. Two years before when her husband had died Mrs. Dyer had come west to be near her son. Her son had invited her to live with them, but she had refused.

"You ain't got room for your own. I did n't come out here to be beholden to anybody. I'll have my own place, and you'll see enough of me, dodgin' in and out, as it is."

She had spent the greater part of the time watching the carpenters at work on her house, during her forced stay at her son's, urging them to work faster, and at last in her impatience moved in before they had finished shingling the roof. She had decided to postpone the plastering until some time when she should go away on a visit.

The sun had gone down. The air was a soft gray and very still.

"Well, I mustn't sit here gettin' the cramps," she said, getting up from the step. "I do say I ain't seen them mover wagons before. I wonder now if they've stopped since I been sitting here. They camped near enough! I suppose they'll buy something up to the store. The movers bring in John quite a little, off and on. There comes John up this way. I wonder

now what he 's comin' up here for. What you want, John? They ain't anything the matter, is they?" she called.

John came slowly toward her. He was a large man, but his clothes, which hung loosely, gave him the appearance of being thin. He wore a soft felt hat pulled well over his forehead. His eyes were like his mother's in color, but there was none of the determination in them.

"Have you seen the movers campin' over yonder?" he asked, pointing across the prairie.

"Yes, I just was lookin' at them when I see you comin' up."

"Well, they was just two of them up to the store, and they was evil-lookin', I can tell you. Marthy was in the store and see them, and she would have it you must come over and stay to our house to-night."

"Why, I ain't afraid of movers, as I know of."

"She don't want to think of you stayin' here by yourself, and I 'll own I don't neither."

"Well, I ain't goin' to leave my bed 'cause some movers happen to be campin' near. There 's always movers comin' and goin'. I guess if they stole me they 'd drop me when it come light enough to see what they 'd got."

"Well, I think you 'd better come. Marthy won't feel easy unless you do."

"I ain't goin' to be so silly, to please Marthy or no one. I ain't got anything they want, without it 's that money I 've saved to have my carpet-rags wove up, and they 'd never think of lookin' in a can for it. It 's one of them cove-oyster cans. I 've made a pin-cushion that fits down into the can, and sewed a silk cover around the outside. You 'd never know it was a can to look at it. I see one made something like it when I lived east."

"You ain't got much money in it, have you?"

"It 's all in nickels. I 've been savin' of it up for near two years. Oh, I guess they must be four or five dollars. I ain't counted it just lately."

"Well, I think you 're foolish to stay here by yourself, when you can just as well come over. I think you 'd better change your mind and come along."

He turned and went back along the grassy road toward his own home. He walked with his head bent down and with a shambling gait. He was dreading his wife's reproaches that he had not been able to induce his mother to come back with him. He did not believe there was any real danger in letting his mother stay alone.

"I guess I ain't goin' to set up for a coward, at my time of life," said Mrs. Dyer. "I wonder now if Marthy really thought I 'd come!"

An express train was coming from the south. The light from the engine could be seen for

some time before there was any noise from the train. Night had come quickly. It was already quite dark.

Mrs. Dyer took off her gingham apron and put it over her head, and stood watching the light from the engine as it drew nearer, and finally when the train had dashed by the little station she turned and went into the house. There were but two rooms in the house—the living-room and a small bedroom opening out of it. Mrs. Dyer went over to the window and looked out.

"It does beat me how soon night comes out here," she said; "back in York State we had a little between-time. There 's the moon shinin' away as if the sun had n't only just left. You can see the movers plain as if 't was day. They 're much as half a mile away, too. They 've got a big fire. 'T ain't likely there 's any more harm in them than there 's in me. I 'm goin' to get out that money and count it. They must be most enough to have the carpet wove by this time. Six dollars, they say it 'll cost me. They never charge no such price as that back east."

The can in which she kept the money was on a shelf behind the stove. She went over and took it down, and then sat down in an old rocking-chair, not far from the window. The moonlight shone in brightly. She took the cushion out of the top of the can and emptied the money into her lap. There was quite a pile of it.

"One would think there was considerable more 'n there is to look at it," she said, fingering the money. "If you could call these pieces dollars 'stid of nickels, 't would be. Might as well say five-dollar pieces while I 'm about it, I suppose."

She began counting the money, dropping each piece into the can as she did so. She enjoyed the sound of the money's rattling. Two or three times she forgot her count, and emptied it back into her lap and began again. Suddenly she started, gathering the money up in her dress. She went over and looked out of the window. The prairie was flooded with moonlight. The light from the fire in the movers' camp lit up the white canvas-covered wagons. Everything was perfectly still. She went over and locked the door.

"It must have been a cloud passing over the moon. They ain't any chance of a person's gettin' out of sight so quick, unless he just went round the house."

She stood listening for some time. "It 's all my imagination. I 'm going to put the money right back and go to bed. They ain't no such great rush about its being counted, anyhow."

She sat down and put the money carefully

back into the can. She did not let it fall in this time, but put each piece in carefully, counting it as she did so.

"There, they 's five dollars and fifty-five cents,—'most enough," holding the can between her hands and looking toward the shelf and then toward the window.

"Now I 'm goin' to bed. I ain't goin' to be so silly as to think any one 's goin' to get it. They 'd never think of lookin' in this can anyhow. They 'd never know it was a can."

She put it back on the shelf, then turned and looked quickly toward the window, trembling.

"Well, I did n't think I was so silly, but seems like I see somebody goin' by that window again. I had n't any business countin' the money and thinkin' about it. That 's what 's upset me. If I 'd lit the lamp and put down the window-curtain and gone to bed in a natural way, I 'd been all right."

She lit the lamp and drew down the curtain. It was a dark-green papershade. Then she went into the little bedroom, undressed quickly, blew out the light, and got into bed, leaving the door into the other room open. She did not go to sleep, but lay there listening, the fear growing every minute stronger and more beyond her control.

Once she sat up and looked out into the other room. Then she got up and pulled aside the curtain in her little bedroom and looked out. The moon had gone under a heavy cloud and the night was growing dark. She could see the other houses of the town from this window. There was a light burning in the back room of her son's house. It gave her a wonderful sense of security. She went back to bed and was soon asleep. Some time near one o'clock she woke suddenly and sat up in bed. The wind was blowing around the house and it was raining.

"There, that rain-trough ain't put up, so 's I 'll catch any water in that barrel! The tubs ought to be put out, too. I ain't had any soft water to wash with I don't know when."

All the fear that she had had in the evening was gone. She began to think of putting on her clothes and going out to place the tubs. As she sat there in bed, the window in the other room was opened softly. A spool of thread that stood on the upper casing fell to the floor. She heard the green paper shade give way—then she knew that some one was in the room.

"Well, I wonder if I 'm goin' to set here stiff and let them take that money," she thought. "Just as like as not they 'd kill me if I 'd interfere. They no doubt have their weapons ready."

Everything was perfectly still for some time. Then she heard the movement of some one crossing the room.

"Sounds as if they was makin' straight for that shelf! They are! I can feel their hand movin' right along the shelf toward it!"

She sprang out of bed and shut the door between the two rooms with such force that the house trembled. At that minute the can containing the money fell with a crash to the floor. The coins flew in all directions. Mrs. Dyer partly opened the door and looked out. In the dim light she could see the form of a man. He had one hand on the window-sill ready to spring through the open window.

"If you 've got any of that money, you drop it!" Mrs. Dyer screamed, forgetting all fear and coming out into the room. "Don't you leave this house till you drop every cent you stole!"

The man disappeared through the window. Mrs. Dyer went and looked out. She could see him for a short distance running across the prairie. He was going in the direction of the wagons. She put down the window and lit the lamp and dressed. Then she found a nail and fastened the window securely. After this was done she got down on her hands and knees and began creeping around the floor, picking up the scattered money. It was a long and difficult task. The money had rolled and hidden itself in every conceivable nook and crack in the room.

At last she gave up the search. She had found all but six of the pieces, and these she decided the man must have taken. Her loss could not have troubled her more if it had been her entire hoard.

"To think of my standin' in there and lettin' him pick it up after I 'd scared him into knockin' it off the shelf! As soon as it begins to get light I believe I 'll go down to the wagon and make him give it up. Like 's any way he 'll hitch right up and get off without waitin' for it to be light."

She decided that it would not do to risk the safety of the money in the can again, and after counting it the second time, she tied it into an old stocking-leg and buried it in the depths of the paper-rag bag that hung behind her bedroom door.

"There ain't any use goin' to bed again now; it 'll soon be mornin'. I believe I 'll look over those beans I 'm goin' to cook, and then get the carpet-rags down out of the loft and look them over and see if they 're in a condition to send away. I half believe I 'll take them over to the woman to-morrow or next day and not wait to save up the rest of the money the way I begun. Or perhaps she 'll wait for the balance."

The morning was clear, and the sun, which came early at that time of the year, lit up the wet prairie-grass and made it dance and sparkle like jewels.

Mrs. Dyer waited impatiently for the first light to see if the movers had broken camp. When it came she saw that they were still there, though evidently making preparations to go.

It was broad daylight when Mrs. Dyer put on her sunbonnet and started across the prairie toward the wagons. Her courage had nearly forsaken her, and at one time she had given up the idea of going at all, but when she saw that they were getting ready to go the sense of her loss was too strong to let her remain.

It was a longer walk to the wagons than she had thought. The prairie-grass was still very wet and dragged her dress. She was tired after the long night, and before she had reached the wagons she wished she had not come.

She found the men hitching the horses. There were two of them. The one woman of the camp was sitting up in one of the wagons, ready to go. She was very thin and looked sick. Her blue calico sunbonnet hung loosely about her face. She looked so weak and child-like that it went to Mrs. Dyer's heart.

"Good mornin'!" she said, looking first at the men and then at the woman.

No one made any reply. The woman looked at her absently with pale blue eyes.

"You 're sick, ain't you?" Mrs. Dyer said, going up to the side of the wagon.

"Yes, I be," she said, in a whining tone, hardly looking at her visitor.

"What 's the matter with you? I should not think you 'd be travelin' over the country this way when you can't hardly sit up."

"That 's what we 're trav'lin' for. Jeff's taking me out to Arkansas Springs. They say it 'll cure me. I don't believe it will. We 've got out of money and I don't get enough to eat. I feel like I 'd die before I get there. I wish I would, I get so tired ridin' all day."

The other wagon with one of the men had started. The woman's husband went around to the other side of the wagon and sprang in, sitting down beside his wife.

"Stop your gabblin' to everybody that comes alongside of the wagon," he said roughly, and taking up the lines he started off across the prairie after the other wagon.

Mrs. Dyer stood watching them for a minute, and then walked slowly back toward the house.

"To think of that sick woman ridin' clear out to Arkansas Springs to get well, and they out of money and her goin' hungry? I declare I feel as if I ought to made them wait and give her every cent of that carpet-money. I 'll never look at that rag carpet but I 'll see just how sick and hungry she looked. I half believe I wish he 'd stole it all."

Gertrude Smith.

A SONG FOR ALL SEASONS.

AH! little one, it is a merry world:

Say so and be not thus forlorn!

'T is all in say-so.

Dare the sharp thistle and the prickly thorn,

And make thy lay so:

If 't is a merry world, then I

Will pluck the thorn, and whistle though I cry.

Thou, youth, since life is all in love, thou too

Say so, and be not thus cast down;

'T is all in say-so.

And if on thee a maid doth nought but frown,

Yet make thy lay so:

Since life is still in loving, I,

When my love frowns, will whistle though I sigh

Nay, man, a kindly and a merry world!

Say so, when thou art near thine end;

'T is all in say-so.

Murmur good-by to life, as thy best friend,

And make thy lay so:

Best life, if I must leave thee, I

Will speak thee fair and whistle though I die.

James Herbert Morse.

THE FOOD-SUPPLY OF THE FUTURE.

IS the evil time coming when population will exceed the capacity of the earth for production and the ever-fiercer struggle for existence will leave the weakest to starvation? Such is the direful import of the doctrine of Malthus, a doctrine which has weighed heavily upon the minds of philosophers and philanthropists, and which has greatly influenced thought if not legislation. But science to-day seems to offer a different answer to this question. Chemistry and physiology, in defining the laws of plant-growth, show that the old ideas which limit vegetable production by land-area and soil-fertility are incorrect, and imply that the capacity of the earth for yielding food for man is almost unlimited. In this view of the possibilities of plant-production, which the whole tenor of scientific research and practical experience makes more and more certain, the prospect for the future of the race is not one of Malthusian dreadfulness, but full of inspiring hope.

But before entering upon the main discussion I may refer to some of the ways in which we can better economize our present food-supply, and how it can be increased by fish-culture, by better tillage of the soil, and by irrigation.

In an effort towards obtaining information regarding the amounts and composition of the food of the people of the United States I have collated the figures for some fifty daily dietaries of several hundred persons in boarding-houses and private families—factory operatives, mechanics, and well-to-do persons in professional life—from the New England and other Eastern States. While these are insufficient for accurate generalizations, they accord with the impressions current among physicians, economists, and other students of the subject, and I am persuaded that when the needed data are gathered for judging as to the amounts of food consumed by people in the Southern and Western as well as in the Eastern States they will not differ greatly in the general outcome from those already collated. The available statistics of food-consumption in England, France, Italy, and especially Germany, are far more extensive. From these I have selected a number which seem to

be fairly representative for comparison with the American dietaries referred to, and with dietary standards proposed by the leading authorities on these subjects.¹ Comparing the American dietaries with the European dietaries and the dietary standards thus brought together, the differences are very striking. The quantities on the American side are very much the larger. This is shown in the figures for the fuel-values, which are taken as the measure of the power of the food eaten to yield heat to keep the body warm and strength to do its work, and are expressed in calories (heat units). The number of the calories in the European dietaries ranges from 3000 to 4200; in exceptional cases of men doing unusually severe muscular work it reaches 4600, and in a single and very exceptional case 5600. In the American dietaries the range is from 3500 to 7800, and in one case of laborers at hard muscular work reaches 8800. Standards by European physiologists for a laboring man at moderate work call for 3050 to 3150, and an American standard for 3500 calories. While men in professional life in Germany, with abundant means, are well nourished with food supplying from 2500 to 2800 calories per day, that of men in similar callings in New England in the cases examined ranges from 3400 to 4500 and more.

We are better fed than the people of Europe, and do more work, and it is doubtless fortunate for us that this is so, but we certainly use much more food than we need. Part of the excess is simply thrown away; the rest is eaten to the detriment of our health. The facts at hand imply that our chief wastefulness is with meats and sweetmeats. This is perfectly natural. People in the United States are generally able to have the kind of food they like and all they wish of it. Sugar is abundant and cheap, and we consume immense quantities, as the statistics of production and importation and our grocers' bills very clearly show. But the worst wastefulness is in the production and use of meats.

WASTE IN THE PRODUCTION AND USE OF ANIMAL FOODS, AND ITS PREVENTION.

FACTS which were briefly cited in previous articles, and which I hope may be given in detail in a later one, indicate that people in this

¹ A brief abstract of some of the more important results may be found in Vol. I. of the "National Medical Dictionary," edited by Dr. Billings and published by Lea Brothers & Co. For other facts see articles on "The Chemistry and Economy of Foods," in THE

CENTURY MAGAZINE for May, June, July, and September, 1887, and January, May, and June, 1888. More detailed data are to be given in the Report of the Storrs School (Connecticut) Agricultural Experiment Station for 1891.

country buy excessive quantities of meat, and especially of fat meat, that part of the excess is simply thrown away or used for other purposes than food, and that part is eaten to the detriment of health. A moderate amount of meat is, I believe, very desirable. The trouble is in our lack of moderation. We like the taste of meat, we can afford all we want, or at least think we can, we have the idea that we need it or that it is good for us, and we do not realize how much more we use than we actually need. Not only is the excess injurious to health, but the waste it involves is greater than is implied in the actual cost.

The chief use of meats in the nutrition of man is to supplement bread, potatoes, and other vegetable foods; in other words, to supply what they lack for our best nourishment. Our foods, animal and vegetable, furnish us material to build up the framework of our bodies and to repair their wastes on the one hand, and on the other to yield heat to keep us warm and to give us muscular strength for work. Blood and muscle, bone and tendon, are made from the so-called protein compounds, such as the myosin, which is the basis of lean meat, casein (curd) of milk, and gluten of wheat. For fuel to yield heat and muscular strength we use carbohydrates, such as starch and sugar, and fats like the oil of corn and wheat, the fat (butter) of milk, and the fat of meats. Vegetable foods, such as wheat, corn, and potatoes, have relatively little protein, and their nutritive material consists mostly of carbohydrates. Beef, mutton, fish, milk, and other animal foods furnish protein in large amounts, and in easily digestible forms. For our best nourishment we want sufficient protein to build up our bodies and to supply their wastes, as well as carbohydrates and fats to serve as fuel. We use meats and other animal foods to supply the protein, in which vegetable foods are relatively deficient.

Meat is a manufactured product for which a large amount of raw material is required. The manufacture of meat is a process of transforming the vegetable protein, fats, and carbohydrates of grass and grain into the animal protein and fat of beef, pork, and mutton. The same principle applies in the production of milk, eggs, and other animal foods. In the most economical feeding of animals it takes a number of pounds of hay or corn to make a pound of beef or pork. In other words, let the farmer make animal protein and fat from vegetable materials in the best way he can, and still he must consume a large quantity of soil product to produce a small amount of animal food. Hence animal foods are costlier than vegetable. This is the simple explanation of the fact that in most parts of the world meat is the food of only the well-to-do while the poor

live almost entirely on vegetable food. Thus ordinary people in Europe eat but little meat, and in India and China they have none at all. It is hard enough for them to get the nutriment they need in vegetable forms. Meats they cannot afford.

But meat-making in the United States to-day is far more wasteful than it need be, on account of the excessive fatness of our meats. This comes about very naturally. We have a great excess of soil-product in the valleys of the Ohio and the Mississippi and on the ranches of the West. At present the pork-maker and the ranchman convert a large portion of this into very fat meat. The pork-producers of the great corn-growing States select the breeds of swine which, as they say, "will take the most corn to market," and have thus got into the way of growing animals that are little else than masses of fat. The beef-growers of the western ranches, and those in the East as well, produce excessively fat meat. Part of the fat is trimmed out of the meat by the butcher, part is left on our plates at the table to go to the soap-man or garbage-barrel, and part is eaten. Unfortunately very many of us eat much more fat, both in meat and butter, than is needed for nourishment, and thus do injury to our health.

The agricultural production of the United States to-day is one-sided. Our animal and vegetable food-products, taken together, contain relatively too little of the flesh-forming ingredients,—that is, those which make muscle and tendon,—and too much of those which serve as fuel. Or, speaking in chemical language, they have relatively too little protein and too much carbohydrate and fat. The reason for this is simple. From careless culture and insufficient manuring, or other reasons, our vegetable products, and especially the grasses and grains, have come to contain small proportions of protein, smaller by from 25 to 40 per cent. or more than the same products grown in Europe. Furthermore, our great staple grain, corn (maize), is poor in protein at best. This helps to explain the relative fatness of our meats. Animals fed on products poor in protein and rich in carbohydrates tend to excessive fatness.

Our national dietary has likewise come to be one-sided. Our food has relatively too little protein and too much fat, starch, and sugar. This is due partly to our large consumption of sugar, and partly to our use of such large quantities of fat meats. In the statistics above referred to the quantities of fat in the European dietaries range from 1 to 5 ounces per day, while in the American the range is from 4 to 16 ounces. In the daily food of the well-to-do professional men in Germany, who were amply nourished, the quantity of fat was from

3 to 4½ ounces per day, while in the dietaries of Americans in similar conditions of life it ranged from 5 to 7½ ounces. The quantities of carbohydrates in the European dietaries are from 9 to 24 ounces, while in the corresponding American dietaries the carbohydrates were from 24 to 60 ounces.

People in this country eat what is set before them, asking no questions for economy's sake provided it suits their taste. We are a generation of sugar and fat eaters. The one-sidedness of our dietary is a result of the one-sidedness of our agricultural production.

To resume. A large amount of soil-product is required to make a small amount of meat. We eat much more meat than is needed to supplement our vegetable food. Our meat is much fatter than would be necessary anyhow. The sugary and starchy foods of which we consume an excess make the fat still less necessary. It is clear then that by the present method of meat production and use a very considerable amount of the grass and corn of our farms and grazing regions is wasted, and worse than wasted.

A reform must come, but it will come no faster than our farmers learn to produce crops richer in nitrogen, and to make more meat and leaner meat from less vegetable material, and consumers learn to buy and use meats and other foods of the kinds and in the proportions best suited to their actual needs. The agricultural reform will lead to the production of more food from less land. The dietary reform will result in the eating of less food per person and food better adapted to the demands of health, work, and purse.

THE SEA AS A SOURCE OF FOOD FOR MAN. FISH-CULTURE.

AFTER we have used our food, the refuse, which contains material that should serve to nourish plants to be used as food again, is to a greater or less extent wasted. In various ways an immense amount of plant-food ultimately finds its way through soils, sewers, and streams into the sea. What makes the matter worse is that the costliest and most precious of all the elements of plant-food, nitrogen, is the one which is most carried from the land into this great receptacle. The plant-food thus conveyed to the ocean is commonly looked upon as lost for future use. But we recover it to some extent, and may recover far more. Late research has shown that part of the nitrogen is transformed within the waters of the ocean to ammonia, which is continually evaporated from the ocean's surface and carried by winds to the land again, there to be brought to the soil by rain and to serve as food for grow-

ing plants. The nitrogen is thus passing through a ceaseless round, from air to soil, from soil to plants, from plants to animals and men who use them as food, and then to the sea, from which more or less returns to the air again. But this is not all the saving of nitrogen from the sea. There is vegetation in the sea as well as on the land. That on the land yields us bread and meat. That in the sea yields fish. Here is the source for an almost inexhaustible supply of nourishment for man. Such reliable authorities as the late Professor Baird, of the United States Fish Commission, and Professor Huxley, serving in a similar capacity in England, have made calculations of the quantities of fish in the rivers, the lakes, and the sea, and of the possibility of increasing this supply by fish-culture. The conclusion as to the amounts of fish which may be made available for food for man seems almost incredible until we look into the facts and find how well they are founded. But this is only part of the story. Fish is especially rich in protein. This fact is brought out very forcibly in a series of chemical studies of the more important species of fish and shell-fish used for food, made under the auspices of the Smithsonian Institution and the United States Fish Commission.¹ In other words, by the culture and use of fish we effect a three-fold saving. We obtain the protein which is needed to supplement vegetable products of the soil as food for man. We thus reduce the demand for meat, for the production of which the product of so much land is necessary. And, finally, we bring back from the sea in the protein of fish the precious nitrogen which is needed to restore fertility to our exhausted soils.

Incidentally we have here an argument for fish-culture the force of which is not usually understood. Fish-culture not only supplies most valuable nourishment for man, but does so by utilizing material that would otherwise go to waste. It makes the sea supplement the land by producing the very food-ingredient that is most lacking in the produce of the soil. It helps materially toward both the increasing and the balancing of products for human consumption which are so essential for the welfare of the race.

In short, if we make leaner pork and leaner beef, and thus use less soil-product to make fat, of which we now have an excess, and if we get more protein from the sea in fish, and raise correspondingly fewer animals to produce protein, we shall save large areas of soil for the cultivation of wheat and other vegetables for

¹ A detailed account of this investigation, which was conducted by the writer at Wesleyan University, is to appear in a forthcoming report of the United States Fish Commission.

food. In this way the soil can be made to supply far more nourishment for man than is otherwise possible.

INCREASE OF FOOD-SUPPLY BY TILLAGE AND IRRIGATION.

Few who have not studied the subject realize the possibilities of crop-growing by irrigation. The lands of Egypt, which would otherwise be a desert, have been kept in fertility for centuries by the overflowing of the Nile; the irrigated plains of Lombardy can yield nine crops of grass in a single year; the sewage-farms of England, over which is spread the sewage of cities that usually flows direct into the streams, yield almost fabulous produce. In the geographies that were used in our schools a generation or two ago a large portion of the territory between the Mississippi and the Pacific was designated as the Great American Desert. The largest yields of corn in the United States, now and for years past, have come from the midst of this region and without increase of water-supply, except that which comes with tillage; by irrigation portions of it are made to rival the plains of Lombardy and Egypt. Already our Government is preparing the way for a vast system of irrigation. It is proposed to build dams and to make reservoirs in the mountains of the West to hold the waters of winter until the time arrives for them to bring their store of food for the nourishment of plants and to enable them to withstand the summer's drought. In the belief of those who have studied the matter most thoroughly such an enterprise put into effect will make the region which covers two fifths of the whole United States include the garden of the continent, and capable of sustaining a population as dense as that of Italy or Spain.

There are those who prophesy that the agriculture of the future will be carried on largely by irrigation, and the more one looks into the matter the more plausible the idea appears. But tillage and manuring work wonders in farming. The produce which the Prussian farmer gets from his sandy plains excels that of our virgin prairies. Countless illustrations of this could be cited. Prince Kropotkin describes a case in point.¹

Is it possible that the soil of the United Kingdom, which at present yields food for one half only of its inhabitants, could provide all the necessary amount and variety of food for 35,000,000 human beings when it covers only 78,000,000 acres, all told—forests and rocks, marshes and peat-bogs, cities, railways, and fields? The current opinion is that it by no means can; and that opinion is so inveterate that we even see a scien-

tist like Mr. Huxley, who is always so cautious when dealing with current opinions in science, indorse that opinion without even taking the trouble of verifying it. It is accepted as an axiom. And yet, as soon as we try to find out any argument in its favor, we discover that it has not the slightest foundation, either in facts or in judgment upon well-known facts.

If we want, however, to know what agriculture can be, and what can be grown on a given amount of soil, we must apply for information to the market-gardening culture in this country, in the neighborhoods of Paris, Amiens, and other large cities [in France], and in Holland. There we shall learn that each hundred acres, under proper culture, yield food, not for forty human beings, as they do on our best farms, but for 200 and 300 persons; not for 60 milch cows, as they do yield in the island of Jersey, but for 200 cows, and more if necessary. . . . They [the gardeners there] have created a totally new agriculture. They smile when we boast about the rotation system having permitted us to take from the field one crop every year, or four crops every three years, because their ambition is to have six, nine, and twelve crops from the very same plot of land during the twelve months. They do not understand our talk about good and bad soils, because they make the soil themselves, and make it in such quantities as to be compelled yearly to sell some of it; otherwise it would raise up the level of their gardens by half an inch every year. They aim at cropping, not five or six tons of grass on the acre, as we do, but from fifty to one hundred tons of various vegetables on the same space; not £5 worth of hay, but £100 worth of vegetables, of the plainest description, cabbage and carrots. That is where agriculture is going now.

Of this *culture maraîchère*, the distinctive feature of which is replanting, Prince Kropotkin says:

In such a culture the primitive condition of the soil is of little account, because loam is made out of the old forcing-beds. . . . No less than 2125 acres are cultivated near Paris in that way by 5000 persons, and thus not only the 2,000,000 Parisians are supplied with vegetables, but the surplus is also sent to London.

The above results are obtained with the help of warm frames, thousands of glass bells, and so on. But even without such costly things, with only thirty-six yards of frames for seedlings, vegetables are grown in the open air to the value of £200 per acre, and even, with some most successful gardeners, £200 on the half-acre. . . . In fact we are totally unable to realize what the soil can give, unless we have seen its liberality with our own eyes. Let me add also that all this wonderful culture is a yesterday's growth. Thirty years ago the *culture maraîchère* was quite primitive. But now the Paris gardener not only defies the soil,—he would grow the same crops on an asphalt pavement,—he defies climate. His walls, built to reflect light and to protect the wall-trees from the northern winds, his wall-tree shades and glass protectors, his frames and *pépinières* have

¹ In an article on "The Coming Reign of Plenty," in "The Nineteenth Century" for June, 1888.

made a real garden, a rich southern garden, out of the suburbs of Paris. He has given to Paris the "two degrees less of latitude" after which a French scientist was longing; he supplies his city with mountains of grapes and fruit at any season; and in the early spring he inundates and perfumes it with flowers. But he does not only grow articles of luxury. The culture of plain vegetables on a larger scale is spreading every year; and the results are so good that there are now practical *maraîchers* who venture to maintain that if all the food, animal and vegetable, necessary for the 3,500,000 inhabitants of the departments of Seine and Seine-et-Oise had to be grown on their own territory (3250 square miles), it could be grown without resorting to any other methods of culture than those already in use, methods already tested on a larger scale and proved to be successful.

The essential features of this system are the selecting of vigorous plants, providing them with proper warmth and moisture, especially in their earlier growth, transplanting them so as to give them the best opportunity for development, and supplying them with abundant food. All this is simply the practical application of the principles which modern science is coming to explain. It is improvement of varieties of plants and the economizing of plant-food and energy.

The selection of the better and the rejection of the poorer individual plants are means for breeding better varieties. Of the variations of animals and plants under domestication Darwin and others have given us notable examples, and the utilizing of the underlying laws constitutes one of the great features of the advance of modern agriculture. Manures, sewage, and other waste products contain the chemical elements of the food of plants that are so precious, because essential for their growth. By the use of glass the direct heat of the sun otherwise reflected from the earth and lost is saved to soil and plant. In the fermenting of waste matters bacteria bring about the union of their carbon and hydrogen with the oxygen of the air, and in this combustion the heat which came from the sun to the plants of whose material the waste matters are composed is made available again. And in the warming by steam-pipes the heat of the sun which was stored in coal in past geologic time is turned to use once more. The power used to carry the water for moistening the soil, whether that of machinery fed by coal, or of animals and men fed by the product of the soil, is part of the energy which the sun supplies.

Thus provided with the proper conditions of growth the plants avail themselves of the stores of material in the air. The product is many times greater than is realized in ordinary farming.

Prince Kropotkin adds "that in the hands of

men there are no unfertile soils; that the most fertile soils are not in the prairies of America, nor in the Russian steppes; that they are in the peat-bogs of Ireland, on the sand-dunes of the northern seacoast, on the craggy mountains of the Rhine, where they have been made by man's hands." The experience of tillers of the soil past and present, explained by modern science, upholds his statement. More than this, there is valid ground to expect that the food-production of the future may far exceed anything that these statements can even suggest.

Toward the realization of all these things that agency which is the fruit of rationally interpreted experience, and to which we give the name of science, is an indispensable and most efficient aid.

About the middle of the last century, a lighthouse, known as the Dunston Pillar, was built on Lincoln Heath, in Lincolnshire, England. It was erected to guide travelers over a trackless, barren waste, a very desert, almost in the heart of England; and long it served its useful purpose. The pillar, no longer a lighthouse, now stands in the midst of a rich and fertile farming region, where all the land is in high cultivation. For many years no barren heath has been visible, even from its top. Superphosphate of lime, a chemical invention first applied to land by the British chemist Murray, and brought to the notice of reading farmers by Baron Liebig, has been the chief means through which this great change was effected. Superphosphate over great stretches of English soil makes, or once made, the turnip crop. Turnips there support sheep, and with sheep the English farmer has been able to get rich on the poorest light lands.

Had not chemists busied themselves to find out what makes plants grow, and had practical farmers not been ready to use their discoveries, Lincoln Heath would perhaps still remain a waste. What is true of this bit of English soil is true in greater or less degree of wide areas of our own and other lands. Whether poor by nature or exhausted by cropping without return of the plant-food taken away, soils can be made fruitful by proper treatment. How to do this, science helps us to find out. The veteran agricultural chemist Professor Johnson of Yale University, Director of the Connecticut Agricultural Experiment Station, who cites the above instance, tells the exact truth in saying further:

Agriculture, as well as other industries, has received large benefits from the systematic investigations of science. Chemistry, for example, has taught agriculture how to utilize the refuse of slaughter-houses and fisheries — the bones, the flesh, the blood, which but a few years ago were waste, a nuisance, and a peril to the public health. It has found vast mines of fossil phosphates in

England, Norway, Spain, France, Germany, Russia, in Austria, Canada, and many parts of the United States; and has shown how they may be quickly and profitably converted into a precious fertilizer.

Chemistry, by discovering and actually defining the food-elements of vegetable growth, and by revealing their sources and realizing the means of making them cheaply available to the farmer, has triumphantly overcome one of the previously insuperable obstacles to the development of national wealth.

Italy, Germany, France, Britain, and the United States have seen or are seeing the productiveness of thousands of their fields decline to a profitless minimum, until lands once beautiful with harvests are desolate and abandoned. But the artificial barrenness and exhaustion, like the natural barrenness of the heath or sand-down, yield to the touch of science; and in all the older countries I have named the work of reclamation is in full progress, and, barring some great calamity of politics or nature, we are confident that the producing power of their soil will never again be less than now, but will increase manifold in the future, until they become gardens in all their breadth and to the very hilltops.

THE DOCTRINE OF MALTHUS AND THE FOOD-SUPPLY OF THE FUTURE.

THIS last statement promises wonderful things. It also brings us to the gist of the whole matter.

The doctrine of Malthus regarding the future food-supply of the world and the ultimate starvation of a portion of the race has been greatly misrepresented, but even the most favorable interpretation is a gloomy one. Briefly stated the theory is that population increases in a geometrical and food-supply in an arithmetical ratio; and hence the time must come when there will not be food enough. Perhaps the simplest and most correct reply to this theory is that the assumption that the race increases and will continue to increase in geometrical ratio is not borne out by observed facts. The theory that the food-supply increases in only arithmetical ratio, and must ultimately reach its limit, is doubtless nearer the truth. But while there is a limit to the possible production of food, it transcends all the ideas that ever occurred to Malthus or to the people of his time. It has always been assumed that the capacity of the soil to produce plants is measured by what is popularly called its fertility—that is to say, the amount of production possible under ordinary conditions of culture. The science of to-day, however, shows this measure to be incorrect, and the practice of agriculture is already beginning to add its testimony to the same effect. And remarkable as is the story told in market-gardening, in the reclaiming of the desert, and in irrigation, it is only the first chapter of a tale

the already attested wonders of which almost rival those of the Arabian Nights.

The fundamental mistake out of which grew the gloomy doctrines of the older theorists was in measuring the possibilities of production by what they knew of soil-culture. Science had not revealed to them that, aside from proper temperature and moisture, the essential factor in vegetable production is plant-food; that this may be given to the plant without the aid of the soil; that what they understood by soil-fertility is a comparatively unessential factor of agricultural production; that, in short, the possibilities of the food-supply in the future are measureless. Since some of these facts are of comparatively late discovery and not very generally understood, and their bearing upon the present question is not always appreciated, they demand, perhaps, a few words of explanation here.

Modern research, in discovering the laws of nutrition and growth of plants, has shown that they can flourish on the most barren soil or even without any soil at all. Of the materials that make up the plant only a very small proportion—say two per cent. or thereabouts of the weight of grass when ready to be made into hay, and a still smaller proportion of the ripened grain of wheat or corn, for instance—has come from the soil, the rest having been supplied by the air from its stores, which are inexhaustible. If we heat a wisp of hay, a grain of wheat, or a piece of potato in an oven long enough it will be dried. The water thus driven out originally came from the air, though the plant obtained most if not all of it from the soil through its roots. If we put the dried material into the fire, the bulk of it will burn away, and only ashes will remain. The combustible portion consists mainly of four chemical elements, carbon, oxygen, hydrogen, and nitrogen. The carbon was obtained by the plant from the air, mainly through its leaves. Oxygen and hydrogen are the constituents of the water, which the air also furnished, and the nitrogen likewise came from the air, though a large part of it—until lately it has been claimed that practically all—was first accumulated in the soil and taken up by the plants. The only food which the soil supplies to plants from its original sources is the small quantity of mineral matter which we call ashes when the plant is burned. Of every hundred pounds of the flour we use for bread, or of the pasture grass from which cattle feed and our meat is made, only a little over a pound in the case of the flour, and about two pounds in the case of the grass, was furnished by the soil on which the wheat and the grass were grown. And that small quantity which the soil contributes from its own original stores is made up of a certain list of chemical elements the ma-

jority of which are contained in ordinary soils in such abundance that the cropping of ages would not begin to exhaust them.

It is hard to think of anything more barren, more destitute of fertility, than sea-sand. In connection with some studies of the chemistry of vegetable production in the laboratory of Wesleyan University we have been growing plants in just such sand, brought from the shore of Long Island Sound. To divest it of every possible trace of material which the plants might use for food except the sand itself, it was carefully washed with water and then heated. The young man who prepared the sand for use, in his zeal to burn out the last vestiges of extraneous matter, heated the iron pots in which it was calcined so hot that they almost melted. The sand was put into glass jars, water was added, and minute quantities of chemical salts, which plants take from the soil, were dissolved in it. In the sand thus watered and fertilized dwarf peas were grown. Peas of the same kind were cultivated by a skilful gardener in the rich soil of a garden close by, and grew to a height of about four feet, while those in the sand with the water and the minute quantities of chemical salts reached a height of eight feet.

This is an old story. For that matter, plants will thrive without even the sand. Experimenters have devised the method of water-culture, by which plants are grown, not in soil at all, but with their roots immersed in water in which are dissolved the ingredients of their food, which the roots ordinarily gather from the soil. The stems and branches are upheld by appropriate supports. Thus cultivated, they are in every way healthy, and attain a more than tropical luxuriance, a development rarely equaled in field-culture. This method of growing plants by water-culture, as it is called, has been developed in Germany more than anywhere else. Professor Wolff, of the Agricultural Experiment Station in Hohenheim, raised four oat plants in this way with 46 stems and 1535 well-developed seeds. Professor Nobbe, of the Experiment Station in Tharand, thus grew in jars of water a Japanese buckwheat plant nine feet high, weighing when air-dry 4786-fold as much as the seed from which it was produced, and bearing 796 ripe and 108 imperfect seeds. Wheat, maize, and other plants, and even trees, are grown in this way. Professor Nobbe now has some trees produced by water-culture from seeds of others which also had never been in soil at all, but had grown with their roots immersed in water. The requisites for such plant-growth are proper temperature, water, and certain elements of plant-food, of which very minute quantities suffice. Given these, and the air will supply the rest, and, if other conditions are right, abundant yield is sure.

The experimenters have found just what are the chemical elements that plants take up by their roots. The list includes phosphoric acid, sulphuric acid, chlorin, iron, lime, magnesia, potash, and, for many plants, at any rate, some compound of nitrogen. It happens that the most of these substances exist in abundance in even the most barren soils. Iron and chlorin never, magnesia rarely, and sulphuric acid and lime seldom, fail to be supplied in abundance. The elements most frequently lacking in our ordinary soils are phosphorus, which is contained in phosphoric acid, potassium, the basis of potash, and nitrogen. These soil-elements are quickest exhausted in our ordinary farming. They, more than any others, are wanting in poor and worn-out land, and they are the most precious constituents of manure. With plenty of these, and proper water-supply, we need have no fear for the agriculture or the world's food-supply of the future.

Although it has been reserved for the science of the present to show that warmth, water, and plant-food are the prime factors of successful crop-growing, the principle has been acted upon from time immemorial. It is at the basis of the irrigation that has been practised since the most ancient times. It is as actually applied in market-gardens about Paris, where such surprising results are obtained; on the sands of Belgium and Holland, that yield food for a dense population, and on the soils of North Germany, which, though they are naturally poor, and have been in cultivation for many centuries, excel to-day the rich soils of our new West in their produce. Not the natural fertility of the soil but its rational culture is what brings the largest, the surest, the most enduring harvests.

THE FUTURE SUPPLY OF PLANT-FOOD.

In discussing "The Economy of Nitrogen" from the standpoint of the then prevalent view, a writer in the "Quarterly Journal of Science" some fourteen years ago said:

To economize nitrogen, phosphorus, and potash, to recover these bodies from waste, and to find substitutes for their present profligate applications is the most sacred task which the chemist can take in hand. The reforms which may shield us from occasional pestilence sink into insignificance compared with those required to guard posterity, in a not very remote future, from chronic scarcity, from recurrent famine, and from a wolfish struggle for food, in which man must relapse into a worse savagery than that from which he has emerged.

But can we obtain the phosphoric acid, the potash, and the nitrogen? It seems to be a law of human progress that when a great want is

defined, the discovery of its supply soon follows. When advancing science had revealed the need of phosphoric acid in poor and exhausted soils, mines of phosphate were found in England, France, Germany, Spain, the islands of the Caribbean Sea, Canada, different parts of the United States, and elsewhere, and the already visible supply, that which has been discovered in the present century, is sufficient for the agriculture of untold thousands of years to come.

For the potash there was for a time no adequate promise. The soap-maker long ago outbid the farmer for the potash of wood-ashes; that of saltpeter is very limited in quality, and wanted for making gunpowder, for salting meat, and for other purposes. A process was invented for obtaining potash from sea-water, which contains a very minute percentage, but the cost of extraction was too great to make it feasible. But some years ago it was discovered that this costly process of evaporation had been carried out on an immense scale, in past geologic time, over an area of some sixty square miles in the region of Stassfurth in Germany, and that in this almost inexhaustible bed of sea salt the potash compounds were on the top. The use of the German potash salts speedily became common in European agriculture, and has extended to the United States and to the coffee-fields of Brazil and Ceylon. The results have been remarkable. Muriate of potash, mined and refined in Germany, brought to this country, and applied at the rate of 150 pounds, costing \$3.50, per acre, on the worn-out soil of a Connecticut farm within a mile and a half from where I am now writing, has made the difference between corn so poor as to be hardly worth the husking, and a crop of sixty bushels per acre of the finest shelled corn, and a most excellent growth of stalks. Even if, in the far-distant future, the Stassfurth potash mines should be exhausted, it is by no means improbable that others may be found. It is evident then that we need not be troubled about the phosphoric acid or the potash.

With the nitrogen the case has, until lately, been somewhat different. Although four-fifths of the air are made up of this element, and over every acre of land there are hundreds of tons of it, crops often fail for lack of it. The prevailing doctrine has been that plants do not avail themselves of the nitrogen of the air to any extent, but are dependent solely on that which has accumulated in the soil in past time or is supplied as manure. The scientific interest of the subject and its incalculable importance have made the question of the acquisition of atmospheric nitrogen by plants one of the hardest fought in the annals of biological and agricultural chemistry. That plants should be

without this power appears strange, and many observed facts in agricultural practice imply very decidedly that leguminous plants, such as clover, vetch, beans, and pease, somehow succeed in getting hold of the free nitrogen of the air and in using it for their growth. But the experiments of the most noted investigators have seemed to bring positive evidence to the contrary, and the prevalent doctrine has been that atmospheric nitrogen is not available to vegetation.

The evidence against the assimilation of atmospheric nitrogen by plants came from experiments in which the conditions differed considerably from those of ordinary plant-growth. In a series of experiments by the writer, the results of which were published in 1881-84, plants (pease) were grown in sand to which water with plant-food in solution was applied, but under conditions otherwise normal. They were found to contain, when ripe, much more nitrogen than was supplied in the nutritive solution and seed. The only possible source of this extra nitrogen was the air. A conclusion so opposed to the commonly accepted belief was received with hesitation, and very naturally so. But in the years following a number of other experimenters obtained similar results. Furthermore, several others, among whom is Professor Berthelot of Paris, have found evidence that soils as well as plants acquire nitrogen from the air to a much greater extent than was formerly supposed, and that they get this nitrogen very probably by the aid of microbes. And what is still more to the point, Professor Hellriegel of Germany has within the past six years made several hundred experiments and not only found that the leguminous plants—pea, lupine, and serradilla—which he has grown acquire large amounts of the free nitrogen from the air, but has brought very strong indications that microbes in the soil are the agents by which it is done. On the table where I write are the figures for somewhat over 250 experiments carried on during the last three years. They not only confirm to the fullest extent the conclusions published in 1881-84, and those of Hellriegel and others since, that the leguminous plants obtain large quantities of nitrogen directly from the air, but show in a no less convincing way that the amount of nitrogen acquired is more or less directly proportional to the number of nodules on the roots, called root tubercles, in which Hellriegel and others believe the microbes to act. With other plants, alfalfa is here found to obtain very large supplies of atmospheric nitrogen. Considering the great importance of alfalfa in a large part of the country, and especially in the irrigated regions of the West, its power to acquire nitrogen is certainly a weighty matter. Professor

Wolff in Germany has reported experiments which indicate that clover has this power of drawing its nitrogen from the air. His results are confirmed by Messrs. Lawes and Gilbert in England, who were formerly, with M. Bous-singault in France, the leading exponents of the opposite doctrine, but who, to-day, in the true scientific spirit, heartily accede to the conclusions which later research is bringing. Kindred results are being obtained by numerous other investigators, and it now looks as though the leguminous plants in general, at any rate those most commonly cultivated, are possessed of this remarkable faculty. Just what species of plants acquire nitrogen from the air, and how they get it, are problems still to be settled.

The connection of microbes with the supply of nitrogen to plants is very interesting. It has been long understood that the nitrogen of animal and vegetable matter in the soil is somehow made available to plants for food. Several years ago two French chemists, Messrs. Schlössing and Münz, discovered that the change is brought about by a ferment. Just what the organism is that performs this most beneficent office of transforming the effete matters of the earth so that they may again become food for plants and man, biologists have sought to learn, but without success, until a short time since, when Herr Winogradsky in Zurich, Switzerland, by a most ingenious series of experiments found evidence that bacteria are the agents. He has given to the group which he finds to cause the nitrification, as the change is called, the name *Nitromonas*. Still more remarkable is the action of microbes in helping plants to utilize the nitrogen of the air. What the species are and what is their exact connection with the process are questions which bacteriologists in Europe and the United States are now studying with the most eager activity. New facts are continually being brought to light, and we may hope for more definite answers to the problems before many years. But the interesting and withal inspiring thing is that these organisms, whatever they shall be found to be, are thus constantly providing for our welfare, that they are necessary and efficient ministers to our very existence. We are wont to think of microbes as only the germs of fever and cholera and consumption, the agents of disease and death; but they are no less truly the means of providing us with what is indispensable to life. The microbes that help plants to their nitrogen thus become, in the light of modern research, part of the beneficent system by which the earth is enabled to give its nourishment to man.

The practical bearing of all this is evident. As the store of nitrogen in the soil is reduced, the soil is exhausted and refuses to yield its harvests. Nitrogen eludes the husbandman,

in being leached out of the soil by drainage waters, and in escaping to the air. He supplies it in manures, of which it is the costliest ingredient. Farmers throughout the older portions of our country pay from ten to twenty-five cents per pound and more for nitrogen in guano and nitrate of soda from South America, in sulphate of ammonia from Europe, in dried blood and meat-scrap from slaughter-houses, and in other commercial fertilizers. For these materials millions of dollars are expended every year in the United States, and the supply of some of them is being gradually used up. By raising leguminous crops, which are in many ways the most valuable for fodder, and which make the richest manures, the farmer may obtain his nitrogen from the air without money and without price. This farmers do and are learning to do more and more.

ENERGY AND FOOD-PRODUCTION.

THE supply of plant-food thus seems to be assured. But the population of the earth may become so dense that very general irrigation will be necessary. The rivers, the lakes, and the sea will furnish water, if it can only be transported. This requires power, energy. Will the energy be forthcoming? Is it at hand?

We are accustomed to think of burning wood and coal as the chief sources of power. But their energy is nothing in comparison with that of moving wind, rivers, and tide, and even that fades into insignificance in comparison with the energy of the sun's heat, a source of power so great that we can scarcely conceive of its vastness. When we reflect that remarkable as are the uses we already make of the different forms of energy, our knowledge of them is still in its infancy; that we are apparently much nearer the storage and transport of the energy of stream and wind and sun than our grandfathers were to what we realize to-day in the use of steam and electricity, it takes no great faith to believe that science and invention will, in due time, supply the need. And with this use of mind to make the forces of nature do what has before been either done by the labor of our hands or left undone, the natural order of events will continue to bring what the progress of the past has brought—more product and larger profit with less manual toil.

Instead of the yield of a dozen bushels of wheat from the poor or exhausted soil of an acre, which was, a comparatively few years ago, a common average in England, and is to-day in a large portion of the United States, thirty bushels of wheat per acre has come to be an average with better culture in England, and will come with us when the demand calls for it. It is not to such increase as this, however,

that we must look for the food-supply of the future, but to such yields as come with sand- and water-culture. We are not restricted to the thirty or sixty or one hundred fold of the New Testament parable, but may look for the thousand fold that is realized with abundant supply of plant-food and water without any regard to soil.

Nor is there anything abnormal in such vegetable production. That a single plant should produce a thousand seeds, as Professor Nobbe's buckwheat plant did, when fifty would be a large yield in ordinary practice; that the produce of a given area should be scores or even hundreds of times what we ordinarily see; that half a dozen crops should be grown on the same area every year instead of one, is not what we are accustomed to, but is not at all unnatural. What we call natural growth is really stunted growth. Our plants are subject to fluctuations of temperature; they have too much or too little moisture; their food-supply is scant or one-sided; and these very hindrances to their growth have had the further effect of preventing the development of varieties capable of producing the largest amount of the most valuable material. Let plants be trained by selection and cultivation to do their best, let them have the opportunity which comes with proper regulation of temperature and moisture and food, then perhaps we shall see what nature can and will do for us. As well say that the philanthropist is the abnormal, and the untutored child of nature the normal man, as that there is anything abnormal in such large vegetable production.

ARTIFICIAL PRODUCTION OF FOOD. CHEMICAL SYNTHESIS.

BUT even if there were no such probability of almost unlimited vegetable production, there is still possibility for food-supply in artificial manufacture by chemical process. Plants take the elements carbon, oxygen, hydrogen, and nitrogen, and combine them, in the forms of starch, sugar, oils, fats, gluten, and other compounds which serve to nourish animals and man. Within the memory of many chemists now living it was believed to be impossible to build up such compounds from their elements by artificial means. But chemistry has found means to imitate these processes of combination. Within the past few years many such compounds have been produced in the laboratory by synthesis. A few months ago, in reply to an inquiry from a friend as to the probability of thus making the nutritive ingredients of food, I wrote: "The advance of science in this direction is not enough to warrant any prophecy of the synthesis of food-material,—in-

deed such a feat seems almost visionary,—but it is hardly safe to say that it is impossible, and there are those who are confident that it will be done."

Chemists distinguish between various kinds of sugars. To one class belongs cane-sugar, which is formed in the sugar-cane, sorghum, beet, and maple, and which we use at the table; to another class belong the glucoses, of which the fruit-sugar that occurs in grapes and other fruits, and the glucose which is manufactured on a large scale from the starch of corn are samples. Some time since Professor Fischer of Würzburg, Germany, succeeded in the synthesis of several sugars closely allied to fruit-sugar. The news has just come that he has found a way to transform glucose into a sugar of the type of cane-sugar. We have long known how to convert starch and cane-sugar to glucose; the process is one of changing a more complex compound to a simpler one. But the possibility of reversing the process was long doubted. Yet just this is what Professor Fischer has now accomplished.

Still more remarkable, I was going to say,—but the time for calling such things remarkable seems to be past,—is the account which has come to hand within a few days of the preparation of an albuminoid compound by synthesis. How carbohydrates and fats may be prepared artificially we have come to understand. But the albuminoid compounds contain more chemical elements, and are far more complex; they are indeed the highly organized material of vegetable and animal life. That these substances could be made in the laboratory has been hard to believe. Yet Professor Schützenberger of Paris has just reported to the French Academy of Science the synthesis of a compound similar to the peptone into which the albuminoids of our food are transformed in the process of digestion.

Farming by water-culture, or the artificial manufacture of food-compounds, would not be feasible or profitable to-day. The growing of a buckwheat plant with a thousand seeds and the synthesis of sugar and protein are now only curious and costly experiments. But will they always be so?

A few years ago an interesting but troublesome lecture experiment consisted in providing a large galvanic battery and causing the current to pass from one piece of carbon to another. A bright light was produced, and there were persons with faith enough to predict that electric lighting would at some time in the distant future be made a practical success. The light of the electric lamp at every street-corner suggests most forcibly that we may be nearer the realization of other triumphs than we think. What we know of these things to-day more

than the Romans knew sixteen centuries ago has nearly all been discovered within the last sixty years. The rate of discovery far exceeds the rate of increase of population. Long before population becomes dense enough to demand such production as I have been suggesting we may hope that the details will have been worked out to make it easily feasible.

A German chemist, Professor Knop, wrote a book on agricultural chemistry. When it was done he gave it the title *Der Kreislauf des Stoffs* (The Circulation of Matter). He realized that he had been simply describing the ways in which the elements pass through a ceaseless round of changes, by which they are made parts of air and earth, then of plants, and animals, and man, then of air and earth again. In this round our food is made, our bodies are built up, and then both are resolved into their elements again. Chemical elements are combined by natural forces into starch and protein, into bread and meat, into muscle and brain. The supply of the elements is limitless for the simple reason that none is ever lost. Like the water which after moistening the soil and nourishing the plant passes away to sea or sky only to come again as rain, the elements of food are resolved into their simpler forms only to be made into food again. How much food mankind may have is not a question of area of arable land or of soil-fertility at all, but of man's control of the forces of nature. That control increases with the increase of human knowledge.

In the past man has had the strength of his hands, and that of the beast which he has subjected to his will, to do his work. In the present he uses the power that came from the sun and is stored in coal. This makes possible the industrial advancement, the lessening of the hours of labor, the rise of the scale of living, and the spread of knowledge. The material and intellectual progress of the nineteenth century is the using of potential energy.

With a supply of material exhaustless and enduring, with power to utilize it unbounded as the energy of the sun, with prospect of new discovery unlimited as the sphere of human knowledge, what bound dare we set, what fear need we entertain, for man's future sustenance?

The rôle of the political economist is hardly fitting for the chemist. But one inference continually occurs to me. To make manufactured products abundant and cheap large demand has been necessary. With the hand-loom of the past a given number of people living in a given area could weave a small amount of cloth. In the factory of the present each operative produces many times more than the weaver of the olden time, many more work in a given territory, and cloth is produced at a much lower

cost. The agriculture of the future will perhaps be a manufacturing process with correspondingly increased product. It may seem paradoxical to say that the dense population which the older economy told us was to be the precursor of starvation will be actually the antecedent condition of a cheap and abundant food-supply; but is this anything more than the reassertion of a principle which has proved itself true in the manufacture of cloth in the factory, of machinery in the machine-shop, and in countless other ways?

IN CONCLUSION.

To resume briefly. In the light of our present knowledge the problem of the world's future food-supply is conditioned upon two things. One is plant-food, the other is energy, power to manufacture and transport plant-food, and to transport water. The visible supply of plant-food is such that the only element about which there has for some time been any question is nitrogen. Late research implies that this can be easily derived from the atmosphere in unlimited quantity. With the unmeasured energy of the wind, flowing water, and tide, to say nothing of the immensely greater energy of the sun's heat, and the possibility of storage, transfer, and use of energy by electricity and other agencies, we may hope that the science of the future will provide the power. The amount of vegetable growth that is possible within a given area is entirely outside our ordinary calculations. The old way of estimating possible food-production by land-area and soil-fertility is wrong. We have only to assume that as the population of the earth increases there will be a corresponding improvement in the use of plant-food and energy, of which the supply is practically inexhaustible, and the problem is solved.

So strangely yet simply it comes about that in the providing of what is essential for the best welfare and highest happiness of mankind in the future, the things which have seemed farthest from our reach, nitrogen and energy, are the very ones which Providence places about us at all times and in utterly inexhaustible amounts. To make them available requires only the pushing of discovery a little farther along the lines in which it is now moving rapidly and surely. To make a practical use of them requires only the demand for the product. If it is conceivable that population should become so dense as to demand more food than can be thus produced by natural growth of plants, there still remain the resources of artificial production. And if it be allowable to reason from analogy, what is needed to make food more abundant and more cheap is enough population to make sufficient demand.

The capacity of men to consume food is limited. The possibility of its production is almost limitless. The very increase of population which the Malthusian doctrine makes the cause of starvation will thus become the condition of cheap and abundant sustenance. So the use of man's brain transforms the prospect of dire calamity, of misery ineffable, into the promise of inexpressible blessing.

The doctrine of Malthus is the product of a time when men's thoughts ran in gloomy channels, when a stern logic, arguing ruthlessly from premises which to-day we cannot accept, led to conclusions at utter variance with the kinder teachings of nature and revelation, and the gentler aspirations of the human soul.

War, pestilence, and famine will not be needed to remove part of the people of the earth in order that the rest may be kept from starving. Instead of using the sword to kill, it may be turned into the plowshare to help abundant harvests. Pestilence, once thought to be the visitation of divine wrath, we now

know to be the work of the microbes of disease. Not only are we finding how to prevent the ravages of these creatures, but we are learning that they are the upholders as well as the destroyers of life, and may be made the agents to protect our children from the very starvation our fathers so much dreaded. In place of the rule of famine which has been prophesied, we have the promise of a reign of plenty.

The doctrine here maintained is optimistic, decidedly so. But what was the earth made for? Is it governed by a beneficent power, or is it not? Are mankind the creatures of Almighty malevolence, or are we the children of a loving as well as omnipotent Father? Are we placed here in a world which is bad and ever growing worse, or is there a continual evolution toward higher and better and happier things? Faith has always had its reply to Malthusian pessimism, though that reply has been vague. The Science of to-day makes it clear. So Faith and Science rightly joined ever lead us to the light.

W. O. Atwater.

FOLKSONG.

"THIS work must give me lasting fame;
Immortal shall it make my name.
Forever live, my monument.
Indeed these years I deem well spent
The while its fabric I have wrought
With web of fancy, woof of thought."

The poet threw aside his pen.
His book was praised awhile by men,
And now it lies on dusty shelves
In corners where the bookworm delves.

Kind Fortune brought some leisure days.
The poet wrote some casual lays:
Songs with smiles and tears together,
All moods of man, like April weather;
"Frail and fleeting fair," said he,
"Their fate is quick obscurity."

But nature's breath inspired their art
And Mankind took them to its heart.
They grew into the people's life,
They marched with soldiers into strife,
Were lullabies for babyhood,
Were whispered low where lovers wooed,
Were sung at weddings to the bride,
Were chanted open graves beside.

The songs have won immortal fame,
And no man knows the singer's name!

Sylvester Baxter.

THE SONNET.

PURE form, that like some chalice of old time
 Contain'st the liquid of the poet's thought
 Within thy curving hollow, gem-enwrought
 With interwoven traceries of rhyme,
 While o'er thy brim the bubbling fancies climb,
 What thing am I, that undismayed have sought
 To pour my verse with trembling hand untaught
 Into a shape so small yet so sublime?
 Because perfection haunts the hearts of men,
 Because thy sacred chalice gathered up
 The wine of Petrarch, Shakspeare, Shelley — then
 Receive these tears of failure as they drop
 (Sole vintage of my life), since I am fain
 To pour them in a consecrated cup.

Edith Wharton.

JAMES RUSSELL LOWELL.¹

R. LOWELL has written into his works his many titles to public remembrance with singular completeness. One need not go outside of the ten volumes in which the fruits of a long literary and public life are gathered to know what he has been and has done. The sign-manual of the poet, critic, and scholar is set upon the various page; moods of the fields and the homestead, the permanent attraction of human nature, patriotism profoundly felt are equally found in essay and poem; and in the admirable addresses there is stored up a lasting memory of the years of his distinguished service abroad. The fullness of this expression of a many-sided career is remarkable; but even more striking is the harmony of all these phases of life, one with another. There is no dividing line which sets off one part of his activity from its neighbor part; in his poetry there is politics, in his learning there is the vivifying touch of humor, in his reflection there is emotion, in the levels of his most familiar prose there is, at inconstant intervals, the sudden lift of a noble thought; and hence his works are at once too diverse and too similar — diverse in their matter and similar in the personality through which they are given out — to be

easily summed or described by the methods of criticism. If there is a clue that may be used, it is to be sought in his individuality, in the fact that his ten talents have somehow been melted and fused into one, and that the greatest — the talent of being a man first and everything else afterward. It goes with this that one looks in vain for any separation of his work into marked periods, such as may be observed in those writers who are absorbed by successive moods of the age or by new foreign influences in thought or literary forms, or generally are determined in their character by external forces. Mr. Lowell, with all his free curiosity, alertness of attention, and openness to the world of the present and of the past, has exercised a power of reaction equal to that of his receptivity, and illustrates the slow native growth of a self-assured mind. From the first to the last of his pages the unity of mind is such that, unhelpt by the context, one could rarely say with certainty whether a particular passage was from earlier or later years. Neither the style nor the way of thinking materially changes; the same person speaks with the same voice throughout. This singleness of Mr. Lowell's personality, by virtue of which he has held the same course from youth to age, as it is most obvious, is a cardinal matter. It were impossible to condense into the brief critical sketch for which only there is now

¹ This article was written for THE CENTURY before the death of Mr. Lowell as a review of the recently
 VOL. XLIII.—15.

published revised edition of his complete works (Boston and New York: Houghton, Mifflin & Co.). EDITOR.

occasion, all that criticism must find to say upon his writings throughout their reach; but in the absence of such a complete and careful survey, something may be arrived at, possibly, by attending to this stamp of individuality which gives likeness to all his works and imparts to them that quality of the living voice which most interests and best holds men, and is besides the invariable accompaniment of an original mind in literature.

It is commonly a disadvantage to a poet to be reputed a scholar. Belief in the spontaneity of genius is deeply implanted in men's minds, and culture is set over against the simple primitive powers of feeling and thought as something by nature opposite. In this popular opinion there is a share of truth. Instinct is the method of genius, but culture, until it has been absorbed into character and temperament, works by afterthought. The conflict which is indicated by this widely diffused impression of the incompatibility of learning and inspiration is often felt by a poet himself in his own experience. Mr. Lowell, who more than any other writer of his time expresses the moods of that border-land which lies between instinct and reflection, speaks more than once of the intrusion of thought upon the natural way of living, and shows the old annoyance, that poetical regret for a simpler habit of life, which underlies the dream of the golden age and is the source of the charm of all pastoral. In a considerable portion of his nature-verse he accepts the Wordsworthian doctrine and goes to the fields as an escape from books, lays thought down like a burden and plays 't is holiday with him, and in coming back to the study seems to make an unwelcome return to himself. Yet he is not slow to acknowledge that the true poet has a pedigree that goes far into the past of men as well as a kinship of the day and hour with sky and birds and trees, the soft air and the warm landscape. If he seeks impulses in nature, he must find art in books; and from his earlier poems it is plain to see what sources in literature he most haunted. Imitativeness in youthful verse is a measure of susceptibility, and is rather a sign of strength than of weakness. The test of originality, or of the native force of the poetical endowment, lies in the spontaneity of the imitation and in the quickness with which one type shifts with another. It is noticeable that Mr. Lowell reproduced kinds of poetry rather than particular authors, style rather than moods, the cast of the words, not ideas; and the sign of culture in these beginnings is shown in the number of types which attracted him. So a similar literary scholarship, an acquaintance with what the poets of many lands had written, gave to Longfellow in his mature life, as well as at the outset, models of

style which he made his own rather by graceful use of them than by informing them with original genius. In Mr. Lowell's case, perhaps, the single peculiarity is the taste he early showed for certain of the English poets of the seventeenth century whose defects of oddity and unevenness could not destroy the largeness of their phrase and the purity and elevation of their continuous style at its best. One need not read Mr. Lowell's criticism to discover what value he placed upon Donne and Vaughan, for example, and those who neighbor them in the "well-linguaged" manner. Culture of this sort, which is no more than the fruit of delight in poetry, has been the possession of many of those poets who are most thought inspired, and genius has thrived upon it; but usually the greatest of them have felt the gap between such poetry of the past and the nature they stood in presence of, and each in turn has reconciled his genius with his own age in some original way.

Mr. Lowell soon developed several styles in which he wrote poems of many kinds, and gave literary expression to sentiment, thought, and emotion; but he was later preëminently distinguished by three forms of verse. The most popular of these, apparently, and certainly the most original, is that in which he employed the native Yankee speech. It was fairly by accident, he says, that he discovered the power of this New England lingo to express the character of the breed of men who used it and its fitness for the purpose in dealing with the subjects to which he applied it. Nevertheless, chance has as little place in literature as in other affairs of life. One finds only those things to which his faith has led him. There are reasons in plenty why Mr. Lowell, and not any of his contemporaries in letters, made the happy discovery of the Yankee idyl. His own roots go deep into the native soil; he loves that from which he sprang, and the past was realized to his apprehension most directly through the old time, which still lingered about the Cambridge of his growing years, and through its concrete characters of diverse types from clerical to rural which interested his human sympathy, struck his humorous sense, and embodied for him the long tradition of a dying age showing its results in man. This strong attachment to the paternal acres because of old associations is a trait common to New England; but none of the poets of the land have given more frequent and free expression to the feeling or shown its power in an individual more constantly. The old New England character appealed to him in the same way that the Scotch type drew Sir Walter Scott's heart out; each found in the ancient habit of life of "sixty years since" a literary opportunity, but

not by thought prepenze; in both the old ways, crystallized in human nature, were loved for their own sake with a kind of natural affection, and were besides dignified by a true respect for their moral quality felt through all their humorous peculiarities. Scotland had more of history, of romance, and picturesqueness to mingle with the human element of common lives; in New England there was less of circumstance, but there was a core of character equally sound, a way of thinking and a freshness of expression, marked and peculiar, characterizing a people. The attractiveness of such survivals from the old days as Mr. Lowell either knew in the beginning of life or met with from time to time in the still uninvaded country districts was enhanced further by the fact that they stood for that simpler mode of existence, already referred to, which the poet is fain to think of as the better way of living, could he make the impossible escape from his own bonds; and it was entirely natural that the two moods should blend and the keen air of New England suffer the pastoral change with the least artifice in the world. In the poem in which he describes his day under the willows Mr. Lowell reveals in most phases the feeling habitual to his mind, of the sense of nature as a refuge, of the strength of associations with a familiar landscape, of the welcome he would give to the rude molds of man, and, in a word, shows the attitude of the poet, who is also a man of thought, toward nature and human nature met face to face; and in this reflective reverie, full of personal expression, the elements are the same as in pastoral verse though seen under a different aspect. When he came to imaginative expression through the medium of old New England, he escaped at once from the literary atmosphere, finding both a subject and a language wholly unworn by use in books; and what he was to express was just that type of character in which human nature was most fresh, sincere, and genuine to his senses and could be entered into most completely by virtue of native sympathies long active in his blood, while the medium of speech was the tongue of the country people as they themselves had fashioned it for their own uses. Not since Theocritus wrote the Sicilian idyls has the pastoral come so near to real life or been not merely so free from artificiality but so slightly transformed in the change from life into art. Mr. Lowell did not attempt the useless task of saying what the average up-country man would have said if left to himself; but, in expressing the true genius of the New England character with a precision and range impossible except to a man of his own faculty, he succeeded in keeping both thought and language within the limit of the character

through which he spoke. He permitted himself to use elevation or pathos or the beauty of natural scenes, which both true art and the impulse of his own awakened powers required; but he has managed all with so sure a hand, such discernment and sensitiveness in his feeling for the form used, that all is as definitely objective as drama or novel, and the sense of reality is heightened, and the expression of the old spirit made more complete, by the curious prose of the pulpit in which the poems are set. It remains only to add that in taking public affairs for the main body of the matter of the verse Mr. Lowell chose the subject that fitted the mind of New England as perfectly as the country language fitted its lips.

Thesecond form of verse in which Mr. Lowell has most excelled is next of kin to the Yankee poems. He was not only the son of New England, but he was born also to the wider inheritance of his fellow-countrymen everywhere, and could lay aside the provincialism of his eastern accent and phrase for the ampler English of the nation's speech. Love of home is the seed-plant of patriotism, and it was inevitable that faith to New England should grow to the larger compass of faith in America; and if in attachment to the native soil itself, such as Mr. Lowell expresses, there may be a certain closeness and peculiar warmth of the hearthstone, in his love of country there is more of what is purely ideal. When he first collected his political papers a year or two ago, there was some surprise at the amount and value of his writings upon the public topics of the time; but though this work in prose had been forgotten, it would still have been plain enough from his poems that he was ever in a true sense the citizen. In thinking of his patriotic verse attention is commonly too exclusively given to the group of odes which were rather the last and crowning work of a lifelong labor than isolated productions. In the very start he gave his country the ringing stanzas of "The Present Crisis," with the one indelible line, and that sonnet to Phillips which still stirs the blood; and, as time went on, in the first series of "The Biglow Papers" he dealt with a great political question of the period, and coming to the strong passions and immeasurable issues of the civil war he could scarce write of anything else. It was only after the peace, and in the assured triumph of the centennial anniversaries of the united country, that he closed the extensive series of poems, inspired by public spirit in the widest meaning of that phrase, with the long odes which by their solemn movement, their gravity, and the loftiness of their finer passages have that stateliness which makes them seem to dwarf his less impressive poems in this kind. He had been the true citizen-poet for almost

a lifetime before he was called to this ceremonial laureateship, and had used the lighter instrumentalities of humor, satire, and wit, the edge of epigram and poignancy of pathos, as occasion arose; so that one may fairly say that first and last he employed well-nigh all the resources of his mind in the service of his country. To think of the odes mainly as Mr. Lowell's patriotic verse would be a grave injustice both to the man and the poet, for passages may be found in the earlier verse equal, at least, to anything except the best in this last group. The distinction of the odes, and one reason why they have affected the public disproportionately in comparison with the best of the other poems, is their style. It is a style which Mr. Lowell has developed for himself, and is to be met with here and there in detached passages of his earlier poetry, but nowhere else is it so even and continuous as in the odes. It is characterized by a breadth and undulation of tone and a purity hard to describe, but these traits are not of consequence in comparison with the certainty with which, no matter how finally resonant the wave of sound may be, the thought absorbs it and becomes itself vocal and musical. The diction itself and the cast of phrase metrically seem to derive from that period of English subsequent to the Elizabethan ferment when the language retained freedom and spirit and a certain amplitude from the past age but had not yet subsided into the formalism, however excellent in itself, of the great age of prose; but if Mr. Lowell found the elements of this grave and full style in that period, he has so recombined them in his own manner that to trace out the source is at most only to hazard a guess. It is, however, this felicitous and well-commanded style which is the noticeable literary quality of the odes, and of the finer stanzas of other poems, such as "The Washing of the Shroud," to name one of the first; to have elaborated it is, possibly, the highest distinction of Mr. Lowell as a writer, in the strict sense, on the purely original side of his literary craftsmanship.

It is, however, almost a diversion to direct attention to the literary quality of these poems. What is most to be remarked in them, aside from their earnest intention and the emotion that is sometimes the welling-up of a deep passion, is the purity of the democratic feeling in them, the soundness of their Americanism. Mr. Lowell in one of his earlier volumes laid his wreath on the grave of Hood, and there are a few of his poems that express the sympathy of philanthropy with the poor and outcast; but this is a comparatively crude form of the democratic idea and is Christian merely. It is easy to pity suffering in any shape and to believe in the virtues that poverty is commonly thought

to favor; it is a harder matter to put faith in man. But that rooted interest in human nature, which has already been spoken of as cardinal in Mr. Lowell's habit of mind, as it helped him to reconcile poetry with the life of rural New England, aided also in the generation of his democratic faith, for when a man is once interested in his fellows he is already half-way to being friends with them and thus coming to know how human they are. To accustom one's self to disregard the accidents of manner and station sufficiently to see the man as he is, to have a clear sight for genuine character under any of the disguises of unfamiliarity and prejudice, to know how simple and how common are the elements that go to the making of manhood, are the paths to belief in democracy; and to do this, it is enough to live out of doors. Culture that lives in the library may easily miss its way. The "Biglow Papers" by themselves would be sufficient proof of such democracy as goes to make a town-meeting; but the American idea is a larger thing. The better proof which Mr. Lowell gave of his quality was in the recognition he gave to Lincoln. He was the first of our writers to see what name led all the rest, and the truth which he intimated in "Blondel," and spoke more plainly in prose, he made at last shine out in the most famous passages of his greatest ode. One could not be so early to perceive this unsuspected fame before it filled the world and while it was yet in the clouds through which it broke, unless faith in man came natural to him. It was so in this case, and Mr. Lowell understood the "new birth of our new soil" not only in the fact that another name was given to immortal memory, but also in the profounder truth that the soil which had borne such a son was the heir of a new age. With all the faith he had in his own people of the past, the poet looked forward to the new race which is yet forming in our womb, and nowhere in our literature is there more direct expression of the national faith in mere manhood than in a few great lines of these patriotic poems, or more soberly and explicitly in the essay upon "Democracy." It may seem little that a man should believe in what his country believes in; but it may fairly be thought that Mr. Lowell, from his place in conservative thought, is as much beforehand in his recognition of democracy in the larger sense as he was earlier than others in his recognition of Lincoln.

Besides the New England and the national poems Mr. Lowell has written a third sort that stand in a class apart and have a distinction, if not so unshared as these, shared certainly by no other poet of this century. They are what would ordinarily be called poems of culture, the verse of a man deeply imbued with

the literature of the past. This definition rests on their form rather than their subject-matter. They are run in the molds that have been handed down in the tradition of literature and belong to the gild. Mr. Lowell, who has shown a disposition to experiment in verse and try many kinds, has used a variety of these set measures, but in two sorts he has shown a hand of unrivaled mastery. In the verses "*Credidimus Jovem Regnare*" there is, perhaps, the best example of one sort, in which the intellect finds crystalline expression; modern as it is in substance and strongly personal in quality, this poem is at once recognized as being composed in a classic style which is neither a revival nor archaic, but, though written yesterday, has the look of century-old verse still fresh. Another instance is the poem upon the goldfishes, one of the best from his pen. The second sort in which this perfection of style is equally found is illustrated by the letter to Curtis as aptly as by any single piece; the terseness, ease, and finish of these lines, in which compliment blends with the wisdom of life and the whole is subdued within the range of personal talk from friend to friend, are qualities unique in our poetry and recall the habits and modes of utterance of a more polished lettered age, when intellect and manners held their own beside emotion and the literary life was more complete in manly powers. In both these sorts of pedestrian poetry, if the devotees of inspiration will insist on the distinction, it is rather the man of cultivation conversing with others than the man of genius expressing his soul whom we find; but the classic literature of the world owes much to the poets who have put into just such verse the mind and morals of their time undisturbed by the strong emotion which has latterly ruled so supreme. Mr. Lowell has certainly strengthened his work by varying it with this element of the prose of verse both in the octosyllabic and the pentameter forms. It was necessary, too, for the complete expression of himself that he should give out his literary culture in art, and also find fit channels for that power of pure thinking which divides with the poetic impulse his allegiance to literature. For, when the end is reached and one looks back over the range of Mr. Lowell's poetical works entire, the one thing that binds them all together and runs through them, besides that unresting interest in man which is their blood, is the equally single and widely diffused presence of thought, which is their spirit. In no poet of our land, at least, is there to be found so large a number of single thoughts, to apply but one test, as in these poems, and there is so little need to say that in none other is there continuous reflection to the same degree, that Mr. Lowell is reputed rather for an excess

of thought. To examine the matter further, to consider such a poem as "*The Cathedral*," for instance, would force this sketch beyond its limits; but the poems of pure reflection should be at least referred to. So, too, the type of which "*Endymion*" is the most eminent example should be named, and the poems in which Mr. Lowell has sought for musical effects—a most interesting group to the student of poetry, of which, perhaps, "*The Fountain of Youth*" is the most remarkable—should not be left unmentioned even in the briefest account of his work. It is not within the scope of this paper, however, to enter upon the criticism of Mr. Lowell's poetry further than to indicate such cardinal qualities as can be brought out by a broad treatment of it in the mass; and if the three kinds of verse in which he seems most to excel,—(1) the pastoral of his own people in their special language, (2) the poems of patriotism of several sorts but particularly those in which he employs his peculiar grave and noble style, and (3) the poems distinguished by classic perfection of manner,—if these have been discriminated, and in the course of such remarks the poet's primary instincts of love of human nature, patriotic passion and faith, and devotion to the worth and charm of literature in both its phases of thought and art, have been made obvious, the little that was aimed at has been accomplished; for it must then appear that in his poetry Mr. Lowell has really expressed himself with directness and fullness, and in the best of his work with no more intrusion of the self-consciousness of culture to the prejudice of the native gift than was necessary to make his poetry square all round with himself. The fact that so much of his verse of all sorts has the quality of improvisation is of itself proof of the immediacy of his method, the genuineness of the impulse, the truth of his statement somewhere that he has ever waited for poetry to find him and make itself out of his life. It results from this that his poetical works are the true record of that life,—the voice, as has been said, of the man, and immeasurably more complete as an expression of individuality than the larger body of prose.

If one must pack the description of that body of prose into a phrase,—and little more is possible here,—it might fairly be said that (to leave the journals out of account) the essays and addresses of various kinds, storing the results of scholarship and reflection, express distinctively the author's mind. Interesting as the political papers are both by their topics and the special contribution of the author to thought necessarily more or less generally shared, they remain subordinate to his critical work on great authors. It is in the literary papers proper that Mr. Lowell has hived what

he has gathered of wisdom in his wide range through literature, and though he does not speak more directly in them than in his speeches or poems, he communicates more and does it in a more exceptional way. Political thoughtfulness characterizes many Americans, but one would hesitate to name even Longfellow as Mr. Lowell's equal in acquaintance with literature, and certainly no other name would be offered in scholarly rivalry with his own on this ground; but he excels Longfellow by virtue of the extraordinary critical power which he brings to bear upon literature. He is, indeed, the only critic of high rank that our literature owns, and the fineness of his quality is obscured by the very singleness of his position, since there are none to compare him with; nor, if one goes to England for such comparison, is the case much bettered, for he surpasses his fellows there with equal ease. The critical faculty is so rare that criticism as an art suffers in repute thereby, and its results are undervalued; but if one is willing to learn, there is in the body of Mr. Lowell's literary papers a canon of pure literature so defined in intellectual principles and applied with such variety and fruitfulness as to suffice for an education in literary taste; and this education is of the best sort since it teaches how to see rather than how to analyze, is intuitive instead of scientific, and thus follows the method native to literature and logically belonging to it. The results of this method in what Mr. Lowell says about great works of genius are, nevertheless, the main thing, and the value of them is sufficiently appreciated by students of literature. It ought to be observed, perhaps, that that wealth of single thought which has already been noticed as characterizing his poetry is as strikingly found in these prose works of every sort. Here, too, no writer of the time equals him except Emerson, and in Mr. Lowell's work there is none of that Delphic quality which sometimes renders Emerson's most impressive phrases only an appearance of thought. Just as in all of Mr. Lowell's writings one al-

ways seems in direct contact with the man speaking, so his words are always weighted with that sense and common judgment which make them shells so impalpable that one touches the mind through them. In his poetry he gives himself, and in his prose he yields up his wisdom; to do this so immediately that the intervention of the printed page is not felt is the last victory of the faculty of expression in literature, whether it be achieved with the simplicity of genius or by the perfection of art through culture, nor are the two ways incompatible.

Such, briefly stated, is the impression made by a broad view of the ten volumes into which Mr. Lowell has recently collected his various contributions to our literature. Notwithstanding his acquirements in general and the special perfection of his literary culture, which are felt throughout his writings in their mass, it would appear that his self-expression, whether on the more scholarly, or the civic, or the simplest human side, has been more spontaneous than is commonly thought. Spontaneity, in fact, is the very quality that ought to be selected and set first in characterizing his work. It is true that the spontaneity of a complex mind wears a different aspect from that of a simpler nature, but essentially it is the same, and brings with it the same reality of life, the same genuineness and sincerity, on account of which it is justly thought to be a primary element in the genius of great writers and true poets. The intrinsic and artistic worth of Mr. Lowell's works has been purposely subordinated here; but that part of criticism of them is not in any risk of misapprehension or forgetfulness. The simplicity of his nature, as shown in his works, beneath the diversity of his interests and the subtle refinements of his intellectual part, the unity of his life as poet, citizen, and thinker, and the harmonious interplay of his faculties one with another, and especially the directness of his expression in every mode of writing, have not been hitherto so much recognized as was right; and only by attending to these primary traits can one be just to a great writer.

George E. Woodberry.

LOWELL'S AMERICANISM.

A LETTER BY THE POET CONCERNING HIS POEMS OF 1875, "THE WORLD'S FAIR" AND "TEMPORA MUTANTUR."

SOME time before the World's Fair of 1876 was held in Philadelphia, Mr. Lowell made a visit to Europe, and was absent from home for a considerable period. On his return in 1875 he wrote two brief poems for "The Nation," which were entitled respectively "The World's Fair, 1876," and "Tempora Mutantur." In these he described certain dangerous symptoms of the body politic. The characterization—as would be expected—was not only terse and pungent, but was enlivened by that unfailing critical humor which made his "Biglow Papers" of a former period famous. It was the voice of correction and warning, however, not a homily of despair. He spoke truth to the country for the republic's sake. The following lines are a fair sample of the tone and direction of the poems. Mr. Lowell, speaking for Brother Jonathan, recommends the exhibition of some of our political inventions of that day:

Show 'em your Civil Service, and explain
How all men's loss is everybody's gain;
Show your new patent to increase your rents
By paying quarters for collecting cents;
Show your short cut to cure financial ills
By making paper-collars current bills;
Show your new bleaching-process, chief and
brief,
To wit: a jury chosen by the thief;
Show your State legislatures; show your Rings;
And challenge Europe to produce such things
As high officials sitting half in sight
To share the plunder and to fix things right;
If that don't fetch her, why, you only need
To show your latest style in martyrs—Tweed:
She'll find it hard to hide her spiteful tears
At such advance in one poor hundred years."

In "Tempora Mutantur" occur these lines:

A hundred years ago,
If men were knaves, why, people called them so,
And crime could see the prison-portal bend
Its brow severe at no long vista's end;
In those days for plain things plain words would
serve;
Men had not learned to admire the graceful
swerve

Wherewith the Æsthetic Nature's genial mood
Makes public duty slope to private good.

But now that "Statesmanship" is just a way
To dodge the primal curse and make it pay,
Since Office means a kind of patent drill
To force an entrance to the Nation's till,
And speculation something rather less
Risky than if you spelt it with an *s*;

With generous curve we draw the moral line:
Our swindlers are permitted to resign;
Their guilt is wrapped in deferential names,
And twenty sympathize for one that blames.

The public servant who has stolen or lied,
If called on, may resign with honest pride:
As unjust favor put him in, why doubt
Disfavor as unjust has turned him out?
Even if indicted, what is that but fudge
To him who counted in the elective judge?
Whitewashed, he quits the politician's strife,
At ease in mind, with pockets filled for life.

It happened that these caustic lines punctured the politician's pachydermatous hide, and awakened resentment. A large proportion of the press (and particularly that part of it which was of his own political faith) pursued him with no polite epithets, and with not a little persistence. It was charged that he was no true American; that he was, in fact, a snob; that he had elbowed against dukes and lords so much and so long that he could not any longer tolerate Democracy. And for many weeks this and other equally puerile nonsense went on unrebutted.

It occurred to me at last to say what was obvious, and record my sympathy with Mr. Lowell's position. That his character and motives were above all need of defense I knew, but such a shocking perversion of his ideas and intentions was altogether too flagrant to pass unnoticed. I therefore took up the cudgels for what seemed to me to be true; and, under the title of "Mr. Lowell's Recent Political Verse," volunteered, in the "Christian Union" of December 15, 1875, a defense of his friendly chidings.

In response to this article Mr. Lowell wrote me the letter given below. It was impliedly confidential, and for many years I have strictly kept it so; but I have concluded, and am sup-

ported by others in thinking, that this privacy is no longer called for. As it has now really become a part of history, and of Mr. Lowell's biography too, the public is entitled, I am sure, to read from a pen that will serve it no more, a pen that has given the country inestimable benefit, honor, and fame, the meaning of those much-abused poems.¹

Joel Benton.

ELMWOOD, 19th January, 1876.

DEAR SIR: I thank you for the manly way in which you put yourself at my side when I had fallen among thieves, still more for the pithy and well-considered words with which you confirm and maintain my side of the quarrel. At my time of life one is not apt to vex his soul at any criticism, but I confess that in this case I was more than annoyed, I was even saddened. For what was said was so childish and showed such shallowness, such levity, and such dullness of apprehension both in politics and morals on the part of those who claim to direct public opinion (as, alas! they too often do) as to confirm me in my gravest apprehensions. I believe "The World's Fair" gave the greatest offense. They had not even the wit to see that I put my sarcasm into the mouth of Brother Jonathan, thereby implying and meaning to imply that the common sense of my countrymen was awakening to the facts, and that *therefore* things were perhaps not so desperate as they seemed.

I had just come home from a two years' stay in Europe, so it was discovered that I had been corrupted by association with foreign aristocracies! I need not say to you that the society I frequented in Europe was what it is at home, that of my wife, my studies, and the best nature and art within my reach. But I confess that I was embittered by my experience. Wherever I went I was put on the defensive. Whatever extracts I saw from American papers told of some new fraud or defalcation, public or private. It was sixteen years since my last visit abroad, and I found a very striking change in the feeling toward America and Americans. An Englishman was everywhere treated with a certain deference: Americans were at best tolerated. The example of America was everywhere urged in France as an argument against republican forms of government. It was fruitless to say that the people were still sound when the Body Politic which draws its life from them

showed such blotches and sores. I came home, and instead of wrath at such abominations, I found banter. I was profoundly shocked, for I had received my earliest impressions in a community the most virtuous, I believe, that ever existed. . . . In the Commonwealth that built the first freeschool and the first college, I heard culture openly derided. I suppose I like to be liked as well as other men. Certainly I would rather be left to my studies than meddle with politics. But I had attained to some consideration, and my duty was plain. I wrote what I did in the plainest way, that he who ran might read, and that I hit the mark I aimed at is proved by the attacks against which you so generously defend me. These fellows have no notion what love of country means. It is in my very blood and bones. If I am not an American, who ever was?

I am no pessimist, nor ever was. . . . What fills me with doubt and dismay is the degradation of the moral tone. Is it or is it not a result of Democracy? Is ours a "government of the people by the people for the people," or a Kakistocracy rather, for the benefit of knaves at the cost of fools? Democracy is, after all, nothing more than an experiment like another, and I know only one way of judging it — by its results. Democracy in itself is no more sacred than monarchy. It is Man who is sacred, it is his duties and opportunities, not his rights, that nowadays need reinforcement. It is honor, justice, culture, that make liberty invaluable, else worse than worthless, if it mean only freedom to be base and brutal. As things have been going lately, it would surprise no one if the officers who had Tweed in charge should demand a reward for their connivance in the evasion of that popular hero. I am old enough to remember many things, and what I remember I meditate upon. My opinions do not live from hand to mouth. And so long as I live I will be no writer of birthday odes to King Demos any more than I would be to King Log, nor shall I think *our* cant any more sacred than any other. Let us all work together (and the task will need us all) to make Democracy possible. It certainly is no invention to go of itself any more than the perpetual motion.

Forgive me for this long letter of justification, which I am willing to write for your friendly eye though I should scorn to make any public defense. Let the tenor of my life and writings defend me.

Cordially yours,
J. R. LOWELL.

THE MAJOR'S APPOINTMENT.

MAJOR HUNTLEY rose—rather stiffly—from the breakfast-table, and stood a moment ostensibly examining a minute spot on the frayed cuff of his well-brushed coat.

The Major was forced to admit now and then, in the intimate recesses of his soul, that he was beginning to feel his age. He was sixty-eight—*only* sixty-eight he would have put it—and considered himself, with some reason, a well-preserved man.

His skin, though wrought with fine wrinkles, had a child's wholesome clearness; the eyes that beamed benignly from under the thick white brows had lost none of their original blueness and brightness, and he was fond of boasting that he had twenty-eight sound teeth in his head yet. But the tall, powerful frame stooped, at some times more than at others, and after sitting still some time there was a difficulty in rising, which the Major scrupulously endeavored to conceal. Not from vanity, though he had his little vanities too, but because, as he told him-

self over and over again, it would not do for a man with five orphan grandchildren on his hands to grow old. He fought old age with the same heroic front and obstinate persistence that had won him his title on the field.

When the call to arms first electrified the land, at the breaking out of the Civil War, the Major, though by no means a young man at the time, took fire at once, and leaving a fairly good business in a northern state to take care of itself, volunteered as a private and served throughout the war; how well, the straps that adorned his shoulders long before its close best testified. Meantime the business he had left to its own divagations had gone the way that might have been expected of it, and after he had been mustered out the Major found himself stranded in the midst of the confusion that succeeded the war.

As he stood looking about him dazed and undecided, there came to him through the din of clashing interests and the dying fanfare of

trumpets and roar of cannon, the well-meant suggestion of an influential friend that he should accept a position as clerk in the Department of the Interior, and the Major fell an easy victim to the proposition. It was not a brilliant position, certainly, but then the Major was not a brilliant man, and a position offering a regular income and a decent living was something to be grateful for, in the then existing state of things. The little cloud, "no bigger than a man's hand," that hangs always in the horizon of the government employé was invisible to the Major. Only when the cloud suddenly overspread the heavens and the storm burst, did he realize that his head had been in jeopardy from the first day. After four years of honorable military service and seven of faithful plodding in civil service, when his needs were greatest and age was beginning to do its work, he was set aside to make room for some great Senator's constituent—that, in brief, was the Major's history.

Being now a resident of the District of Columbia, the Major was nobody's constituent. He had friends in plenty, as friends go, and they had exerted themselves in the beginning to get the Major reinstated, but they, too, were citizens of the District, and therefore nobody's constituents. Their efforts, it is needless to say, had proved unavailing.

But though the Major's friends were discouraged—easily, perhaps, as is apt to be the case when people are exerting themselves without hope of other reward than that proverbially awarded to virtue—the Major himself had never faltered.

There was always one of the Major's applications for place on file in some one of the departments, and the Major's figure was one familiar to departmental eyes. Indeed, his quaint person, the persistency with which he continued to haunt anterooms, corridors, and lobbies, sending in card after card, varied by carefully written, courteous letters to this or that political magnate, and the outward equanimity with which he bore rebuff, made him a fruitful subject for wit among door-keepers, messengers, and petty clerks. That sort, inured to such sights, saw nothing pathetic in the spectacle of gray hairs brought so low and long and honorable service thus rewarded. The Major, with his tall, stooping figure, each year a little more stooping, his old-fashioned, seedy garments, each year a little seedier and older-fashioned, his mild, refined old face, whose genial smile grew each year more childlike and appealing—the Major, with all these attributes, was only "a crank"; a little less fantastically ridiculous and troublesome than others, but, all the same, a crank. Yet though all this did not fail to wound, and even temporarily to depress, it had no last-

ing effect upon the Major's sublime confidence in the eventual triumph of his cause.

"The United States Government is certain to recognize my claim, sooner or later, sir," he warmly insisted. "The country cannot afford to let an old soldier and public officer suffer."

The dubious smiles these asseverations were apt to produce on the faces of his audience irritated, but did not dishearten him. The Major's honest faith in the existence of that myth—a Republic's gratitude—remained unshaken.

But to return. While the old man stood waiting for Time to let go that playful grip upon his lower limbs, Jocelyn, eldest of the five orphans mentioned, a slight girl of twenty, but looking older, sat watching him gravely and affectionately from the other side of the table.

The other orphans, Meg, Aleck, Hal, and Jack, had already breakfasted and departed for their several schools. The two were alone over the late breakfast that was one of the Major's weaknesses.

"Shall you go out to-day, grandpa?" the girl asked in the soft Southern drawl she had caught from her Virginia mother. "It is right blustering, and there 's ice on the pavements still."

"I am obliged to go, dear," the old man answered, bestirring himself with an air of importance. "I have an appointment with a gentleman at Willard's." A shadow crept over the girl's face.

Ah, those appointments with gentlemen at "Willard's," and "The Ebbitt," and other headquarters of lobbyists and wire-pullers—how many of them had the Major kept during the past ten years!

"It is a gentleman," cheerfully went on the old man, "who knows the Secretary of the Interior intimately, and he assures me that matters are coming to a head at last. I have it on good authority that the President has become interested in my case. Yes, my dear," he brightly added, "I may very likely have good news for you this evening."

Jocelyn answered his smile with another—a rather sad and perfunctory one—and rising, went into the little conservatory built out from the dining-room, where the sigh she had suppressed exhaled itself among the carnations and heliotropes blooming on the shelves.

The Major, as was his custom after meals, placed himself on the hearth-rug before the portrait of his dead wife. It had been painted in the early years of their married life, and by no unskilful hand. The Major had never been able to perceive much change in his wife's appearance up to the day of her death a few years before, and each year that greened the grass above her grave in Oak Hill helped to efface

even those slight ravages of Time from his memory. She lived in his heart crowned with all the beauty of her distant youth.

If only she might have lived, he reflected, to share the better days about to dawn—she who had borne so nobly the sorrows and cares of the past! Poor Kate! poor girl! How happy he might have made her yet!

At such moments as this the Major certainly showed his age; he stooped more, and the lines in his face deepened; but as Jocelyn came to-

need to go outside of home to work, after I'm appointed."

"It is n't the work I mind, you know, grandpa. It is not having enough of it."

"Oh, you do enough, dear. Quite enough. More than enough. Don't fret, child. It's going to be better soon. No doubt of it! I say, dear—er—have n't you forgotten something?"

Jocelyn looked at him a moment and joined in his playful laugh.

"THERE!"

ward him with his hat and cloak he straightened himself and smiled down upon her cheerfully.

"Let me see; this is one of your busy days, is n't it, dear?" he said, as she drew the dark blue folds of the old military cloak about him with her little maternal air.

"I wish it were to be even busier," the girl answered, a careworn look stealing into her brown eyes.

"Oh, never mind, dear. Never mind," the old man responded, patting her shoulder affectionately. "Keep up courage. You won't

"That is the first time I've forgotten it, is n't it, grandpa?" she said, going to the conservatory and returning with a sprig of heliotrope which she fastened to the shiny lapel of the cloak. "There!" with a laugh, "now you are finished and look perfectly lovely!"

The Major laughed, too, and went his way, holding himself very erect, and looking, Jocelyn thought, very handsome and picturesque with his long, snow-white locks falling over the blue cloak.

The Major's *bouttonnière* was one of his most

amusing idiosyncrasies in the eyes of most people. Even Jocelyn, detecting a facetious glance directed at it, would now and then wish for his own sake that he would give it up, but the old man would not hear of such a thing.

"Kate always liked to see it," he would say, with a pained yet obstinate look, "and it certainly harms no one."

And so the custom established by his wife in early years was not disturbed, and the little ceremony of attaching the floral decoration remained among the other duties that had fallen to Jocelyn's share.

After her grandfather had disappeared from view the girl turned from the window with a gravely troubled face. That assumption of having five orphan grandchildren on his hands was one of the many delusions the old man hugged jealously to his soul. In truth, it was many a day since he had added anything worth mentioning to the family income. The very house they lived in, an old frame mansion situated far up in the northwestern part of the city, had come to them from Jocelyn's mother.

It was a crumbling, ramshackle old affair, and what with taxes and repairs cost them a pretty sum yearly, but the ground it stood on would bring a good sum one of these days, when the youngest orphan, now twelve years old, should come of age, before which time it could not be turned into money.

Meantime some people wondered how the Huntleys managed to get along. Others, better acquainted with the family, could have told them. Two front rooms of the old house were rented to a couple of ancient spinsters. Almost every dollar besides was the result of Jocelyn's labors. She sold cut flowers from the little conservatory established by her invalid mother as a last resort; she did some fine needlework, and prepared rich preserves and jellies from her mother's Old Dominion recipes, for wealthy neighbors; she played the organ in a struggling church for a mere pittance, and taught the piano to beginners, at a low price, for Jocelyn had never had much opportunity for study of the art she loved. A hard-working, brave, patient little woman, as fond of fun and pleasure as most girls, but never envious nor discontented. Yet sometimes, when the pressure of care was too heavy, her heart misgave her, and this was one of the times.

Bills of all sorts and sizes were waiting to be paid. People were very kind about waiting, but there is a limit to human patience. Then the tin roof leaked frightfully, and the man called in to repair it reported it beyond help—a new one was needed. One of the spinsters had waylaid her on the stairs with the information that the stove "omitted gas" into her room. All the "children," as her sister and

brothers were still called, though the youngest towered above little Jocelyn's head, needed shoes, hats, everything. Only the day before one of her richest patrons had taken away her two best pupils, because they were "doing so well" and consequently required, in the mother's opinion, a "man teacher." Always the same obstacle! Being "only a girl" had become a bugbear to Jocelyn at an early age, and not even a strong, brilliant girl, either, such as Meg was going to be, but a little creature with small, weak hands that could never "stretch an octave," and a sweet thread of a voice that could never make itself heard even in a quartette choir, and possessing no great talent for anything, except steady, patient work, and ingenious managing of small sums of money.

Yet with all this work and managing a crisis was at hand. The waters were rising fast, and threatened to engulf them. That is a figure of speech that Jocelyn frequently used in these self-communings without having any very definite idea what being "engulfed" really would be like. What *did* become of people like themselves when they were "engulfed"? Where did they go to, and what happened to them when they got there? Hitherto the swelling waters had stopped short of the line above which absolute ruin and destruction waited. Would it be so now? If present difficulties might be met, and only one more year tided over, Meg—now in the Normal School—would be ready to teach, and Aleck, once through the High School, would find employment, but how to achieve that end?

With one of those agonized upliftings of the soul to God which are the voiceless prayer of the desperate, Jocelyn forced back a choking sob, and went resolutely out into the world to fight the unequal battle for bread and independence she had been fighting so bravely for years.

About five o'clock in the afternoon of the same day three young men came down the steps leading from one of the eastern doors of the Treasury Department, and mingled with the living stream that, flowing from between the great columns, spread itself to all points of the compass through the broad streets of the national capital. All three were typical department young men, well-dressed, easy in manner, and unmarked by any signs of excessive toil, but one of them, a dark, handsome fellow, carried himself with a moody air in sharp contrast to that of his companions, both of them obviously in that complacent, self-gratulatory state accorded by a merciful Providence to the mentally vacuous.

"I say, Remington," asked one of these latter of the other, as they strolled down the avenue, "how was it at the Ledyards' last night?"

"Dev'lish slow!" responded Remington, with a studiously blasé manner. "You know the old lady has taken up the temperance fad. Not a thing to drink stronger than bouillon. If there's anything I hate it's bouillon! If it had not been for Peters I should have choked before midnight. You know he always goes prepared for such emergencies. Awful bad form, I know,"—he had seen a look of disgust in Beverly's dark face,—*"and no end of disagreeable, but what's a man to do when people go in for cold water as a beverage? A man is driven to extremes. Nothing so demoralizing to society as these total abstinence organizations."*

Rivers laughed delightedly. Beverly smiled a faint, discouraging smile that left Remington in doubt as to whether it was his wit, or something less flattering to his self-conceit, that produced it.

"Oh, Beverly! He can afford to sneer," said Remington, half-sulkily. "*His* lines fell in pleasanter places. Don't you know that he led the German at the Fosbricks' last night? No total abstinence about that establishment, eh, Beverly?"

"It might be an improvement if there were," said Beverly with indifference.

By this time they had reached the corner made historical by that time-honored political headquarters, Willard's Hotel.

"Hello!" exclaimed Rivers, laughing. "There's the Major. I have n't seen him for a month. I wonder if he has got that appointment yet."

"He?" said Remington. "Who is going to appoint an old fossil like that? He has been trotting around the departments for the last ten years. He'll never get anything."

"No, of course not," assented Rivers. "He just makes a laughing-stock of himself, with his cards, and his letters, and all that rot. He stands more snubs than any man I ever heard of. Why does he keep it up, I wonder?"

"Why does a drowning man catch at straws?" demanded Beverly, almost fiercely, dropping a contemptuous look from his superior height upon his companions. Then checking himself, as if aware that it was not worth while to waste fine sentiments on such an audience, he was silent. But as the trio passed the Major standing alone on the curbstone, Beverly touched his hat with a respectful air, an act which did not escape the eyes of Remington.

"Oh, I forgot," said the latter, undeterred by Beverly's scowls, "the Major has a granddaughter. Very nice little girl, too. Met her at a barge party last summer. Not pretty, you know, but very nice. Dances well. Sings, too. Sweet little summer girl, eh, Beverly?"

"Leave me out of the conversation, won't you?" said Beverly, with a dark glance.

Even the impervious Remington was irritated as well as a little alarmed by the tone and look, but would not jeopardize his chances of being seen in Beverly's company by betraying resentment, for the latter had the entrée to a circle toward which he vainly aspired.

They had stopped before a window where were displayed some gaudy cartoons in which the jocular first of April, now close at hand, was made the most of as a nail upon which to hang political satires of a popular, but excessively vulgar, character.

Remington, himself a joker of the most objectionable type, and Rivers, his washed-out image, found these extravaganzas highly mirth-provoking. Beverly looked upon them without the ghost of a smile on his face.

"HE LOOKED BLUE AND PINCHED."

"Deuced clever!" exclaimed Remington for the tenth time, as they started on.

"Deuced!" echoed Rivers.

"Oh, I say!" said Remington, jubilantly, after a two minutes' reverie, "I have thought of the finest joke! Listen!"

Then, as well as he could for laughing, he proceeded to impart to his companions his latest inspiration in the way of being funny.

"There, what do you say to that?" he wound up, gleefully. "Good, eh? Capital idea, is n't it?"

"Immense!" drawled Rivers. "Best thing I ever heard of. What do you say, Beverly?"

They had come to a stop while Remington was speaking, and Beverly had listened, his eyes on the humorist's face with a look slowly kindling in them that now leaped into a blaze.

"I say," he answered with scorn, "that it is

recently suffered some pain and humiliation almost too great for comprehension.

Wild gusts tore around the exposed corner where he stood, wrapping the old blue cloak around him at one minute and at the next almost tearing it from his shoulders, blowing the long silvery locks about his temples, trifling with the withered flower that still clung to his buttonhole, and freezing the very marrow in his bones; yet the Major was but dimly aware

"THE OLD MAN WITH THE LETTER IN HIS HAND."

an idea which could not by any possibility enter a decent man's mind — not to mention a gentleman's."

Without another syllable he turned and left them. This was a trifle too much even for the caddish soul of Remington. A look of sulky anger followed Beverly up the street.

"Pretty rough, by George!" murmured Rivers, recovering from his paralyzed state of mind.

"Oh," said Remington, affecting a grand air, "he 's out of sorts to-day, somehow. Come along, Rivers!"

A moment later the two had disappeared in a neighboring pool-room.

THE Major stood on the curbstone in the bleak March wind waiting for his car. He looked blue and pinched, and there was a hurt, shamed, puzzled look in his face, as if he had

of the keen wind, so much keener was the pain at his heart.

The day now passing had differed only in degree from hundreds that the old man had lived through before. Like them it had begun in hope and ended in disappointment, only this time the hope had been brighter, and the disappointment in consequence more crushing. By the representations of some unwise adviser he had been led to attempt a personal interview with a certain temporary magnate, and had met with a rude, even brutal, rebuff. In the course of his ten years' struggle the Major had met with many rebuffs before, but they had been couched in more or less courteous phrases. It was his first experience of open, gross, and cruel repulse, and the barbed shaft had entered deeply, and rankled painfully. From sheer force of habit he had made his way to this place where he was in the habit of taking a car for

home, but car after car passed and he made no effort to stop one. It was as if he saw them not, or saw them as one sees the changing phantasmagoria of dreams. An old friend had once said to him :

"Whatever you do, Major, for God's sake don't lose your grip !"

At this moment the Major was very near it. It had come to this, then ! His sixty-eight years of untarnished, if obscure, existence, his long and faithful services to his country, his character as a man and a citizen had brought him only neglect, poverty, and insult. Certain terrible facts which the Major had heretofore refused to recognize had been brutally thrust upon his attention.

"I am an old man !" he kept repeating to himself. "Yes, it cannot be denied, I am an old man ! I have outlived my usefulness. He—he intimated as much, and I dare say he is right, though it never struck me so before !"

He held up one withered hand and looked at it critically a moment.

"A little unsteady, for a clerk, maybe," he muttered, with a bitter smile. "Strange I never thought of it before ! And my strength is not what it was. No. That Peninsular Campaign began the work, and I'm afraid I've fought it off as long as I can. I'm beginning to fail. There's a weakness in my breast sometimes, a difficulty in breathing. Oh, my God, I've been losing time all these years ! But I was so sure, so sure ! I could not believe I was to be left to suffer in my old age—an old soldier, a faithful officer !"

He shook from head to foot with the shock of the thought.

His eyes, full of dumb anguish, wandered over the faces of the passing crowd, the continuous stream of government employes issuing at this hour from the various departments.

"Yes, I see ! I see ! Not many heads as gray as mine among them. Where are they all, I wonder ?"

There came into his mind, confusedly and dimly, a poem he had once read, of an old steed turned out upon the highway by a cruel master to live or die as might be ; he recalled how the starving beast, browsing among some foliage, had by chance rung the bell at whose sound the King's Syndic must appear, to listen to the complaints and redress the wrongs of even the humblest of his subjects, and how even this unwitting appeal of a dumb brute was not in vain.

"I have rung the bell," said the old man, with a mournful smile, "but in this land of liberty and equality there is no merciful king, no wise Syndic to mete out justice and redress wrongs like mine. Instead I must feel the lash and cudgel on my old bones."

With a feebleness never so apparent before, the Major at length boarded a crowded car. Some one—a sweet-faced young girl—insisted that he should take her seat. No longer ago than that morning he would have repudiated the offer with chivalric scorn ; now he thanked the girl gratefully, and let his trembling limbs down upon the seat.

"I'm an old man, Miss," he murmured with a deprecating smile, "a very old man !"

There were some acquaintances and neighbors in the car who had a friendly word or nod for the old man, but no one took any special notice of him. Not that any one had aught against the Major. On the contrary, they would have asserted unanimously that he was an amiable, upright, harmless old gentleman, a little given to garrulity on the subject of his own grievances, if given encouragement—that was all.

There exists in most of us a sad tendency to shrink away from such of our fellow-creatures as seem to have been especially singled out by misfortune, as ships at sea steer clear of the barnacle-incrusted derelicts that drift across their pathway.

So the old man sat silent and unnoticed in his corner ; it was even necessary to call his attention when his street was announced, and some one, watching his laborious descent from the car, remarked in a casual way that "the old man seemed to be breaking up," a remark which occasioned no special manifestations of interest or sympathy.

After any particularly severe disappointment the Major was wont to keep for some time within the four walls of his home, as the sick or wounded animal seeks some quiet spot in which to suffer and die. Only the Major did not die. Suffering silently he waited for the rebound to come, and with his brave and sanguine temperament it was sure to come in time. This time it was so long in coming that Jocelyn, wise in reading the signs, and noticing the heavy droop of the silvered head, the pained look that had not left the dear, mild, old face, feared it might never come, and went away to her daily toil with a heart burdened with fresh misgivings. One of these mornings, after Jocelyn had gone, the old man wandered to the window overlooking their charming old-fashioned, untidy garden.

That was a merry prank nature had played between the going down of the sun on the 31st of March and his rising on this, the first day of April. People had gone grumbling to bed with the maddest of March winds whirling, banging, and shaking every out-of-door object susceptible of motion. Plenty of ice lying in wait for the belated pedestrian ; quite a flurry of snow, too, towards midnight. "Old Probabil-

ities" predicted "a falling mercury with easterly winds." Lucky for him that he had nothing more valuable at stake than his already damaged reputation for prophetic accuracy, for whoever rose early that morning and looked out of window must have looked Spring herself square in the face.

Such glow in the sunshine, such balm in the air, such an unfolding of tree-buds, such a twittering and hovering of birds, such an apparition of garden blossoms, such a riot of song, color, perfume!

As the Major looked out upon all this, something of the subtle essence of the spring found its way into his veins. He was smitten with a quick sense of shame. It was weak, unmanly, childish, he told himself, to droop and despair as he had been doing for the past few days, merely because one man, dressed in a little brief authority, did not happen to possess brains or heart enough to keep him from abusing his power. If he did not look out people would begin to say of him, as he had heard them say of other old men, that he was "in his dotage." This thought made the Major's cheeks burn. He must, he would rise superior to the depression that had mastered him. Why not, by one broad expansion of courage, one grand mustering of will-power, sweep the clouds from his mental heavens as those farewell breezes of March had cleared the blue sky yonder? Already he felt stronger, more hopeful. His face was less rigid, there was more brightness in his look, more buoyancy in his attitude. For the ten thousandth time he went over his case in detail, viewing it in every possible light. There was no doubt whatever about it, his was a strong claim, a just cause; it must triumph in the end.

That letter-carrier yonder, that commonplace plodding fellow in gray, would one day, when he was least expecting it, perhaps, be the messenger of good tidings. Some day he would cross the street, as he was now crossing it—come up the steps, as he was now coming—ring the bell, as he was now ringing it—and hand him, as he now handed him—great God!

There was a chair in the hall, and the old man, with the letter in his hand, sank weakly upon it. It was some minutes before his shaking fingers managed to tear open the official envelope, still longer before his blurred eyes could decipher, his whirling brain comprehend, the contents; the printed heading—"U. S. Treasury Department"—the concise phrases, "you are requested to report," "assignment to duty," swam confusedly before his eyes. The signature he did not examine. Why should he? The one mighty, pregnant fact that had set his soul to reeling with joy—that he recognized. It was enough.

His first movement, when he was capable

of motion, was to go and place himself before the portrait, whose soft dark eyes seemed to meet his own with answering tenderness and delight.

"It has come, Kate dear!" he said again and again, with streaming eyes. "The appointment has come at last. Thank God, we are saved!"

Presently he began preparing to go out, himself giving the final brushing* to the old cloak and hat, and even pinning the spray of heliotrope in its place, with trembling fingers. He thought at first of leaving some lines for Jocelyn, then he decided to wait and announce the news in person. He wanted to see, and enjoy to the full, the effect upon her, and all the children. They had been growing incredulous, poor souls! What a change it was going to make in all their lives! How he would lift the burden from Jocelyn's young shoulders! What brightness he would bring into her life! Noble, devoted girl! Now she should have leisure to be young and pretty and gay, like other girls of her age.

Old Molly, the negro cook, as much a feature of the tumbledown establishment as the decrepit porch and crumbling chimneys, was engaged in the operation designated by herself as "wrenchin' off" the front steps when the Major wrapped in his cloak started out.

"Tell Miss Jocelyn not to expect me before dinner," he said to her in passing.

His voice sounded firm and strong even to the dulled ears of the old negress.

"Wha' for de Major a-whoopin' an' a-hollerin' at me dat a-way?" muttered Molly, gazing after him fondly and proudly. "Mus' think hisself a young man! Hm, hm!"

Who said the old man was "breaking up"? It was a man of certainly not more than fifty who walked, brisk and erect, down the street that morning. The years had slipped from him marvelously during that last half-hour. He even caught himself humming an old tune, and a very frivolous old tune, too, as he went along, and was quite alarmed lest some one should have observed this lapse from dignity. The Major was very particular about his dignity.

An hour later the Major entered the room of the official to whom he had been requested to report, and paused in a dignified attitude of waiting.

A number of clerks were present, some of whom gave him a careless glance, without ceasing their work. Two of them, however, paused, exchanged a look in which dismay rather preponderated over amusement, and resumed writing with ostentatious zeal. Another, a dark-browed young fellow, looked up,

changed color, fixed a glance of concentrated passion on the other two, and bent, scowling, over the papers on his desk.

As the moments passed and his presence appeared unlikely to produce any further impression, some embarrassment began to show itself in the Major's manner. He shifted his position a little, and coughed slightly behind his much-darned glove.

The dark young man alone looked up, and, catching the old man's errant glance, nodded almost imperceptibly toward the chief clerk, whose countenance was at that moment obscured by an open journal.

With heightened color the Major approached the official, and laid before his impassive eyes the letter he had received that morning.

The official opened it, glanced at it, frowned, smiled — very faintly — frowned again, and looked the Major square in the face, with obvious annoyance.

"Is it possible, sir," he said, shortly, "that you have taken this thing seriously?"

The Major thought he could not have understood correctly. He leaned forward, supporting himself on one hand.

The official repeated his words in a louder tone. Some of the clerks looked up. Three of them wrote on steadily.

The official turned the letter around toward the Major, and pointed at the signature, or rather at the ingenious complication of curves and angles that at first glance might have been easily accepted as one of those remarkable signatures for which public men are noted.

The Major stared at the tangle of lines dully, uncomprehendingly.

"Don't you see, sir?" said the gentleman a little sharply, "that it is no signature at all? The thing is a fraud, sir! You are the victim of some idle fellow's miserable joke. If you had examined the paper more carefully you would have discovered it yourself. I hope — I trust —"

The words died on his lips. No one will ever know what the public functionary hoped and trusted.

The Major had been standing with one hand clutching the edge of the desk, the other pressed against his temple. A livid red had flown to his face, a vein started out on his forehead and throbbed visibly; his eyes glared. There was a dry click in his throat, and the hand slipped from his head and pulled at his collar, loosening it a little. Then suddenly the flame died from his eyes, and the color from his face, leaving it blank, and of ashy hue. Without a word he reached for the letter, folded his cloak about him, bowed with dignity, and walked, very slowly, from the room.

The official watched him out of the door,

then sent a long, penetrating look about the room. Every head was bent, every pen busy; but to one head, a blonde one, the official eyes returned, and rested there a moment with peculiar insistence.

"Mr. Remington!"

At the sound of his name, sprung upon him so suddenly, that individual started, confusion in every feature.

"Er — nothing of importance," said the official, keeping a quiet level gaze upon him. With ashy cheeks the clerk resumed his pen.

"As I suspected!" muttered the official behind his journal. "Very good, my humorous young friend! But if your little April hoax does not prove a boomerang it shall not be my fault!"

As they left the office at noon, Beverly walked straight up to Rivers and Remington.

"You are a couple of dastardly sneaks and scoundrels!" he said in a voice of suppressed fury. "Never dare to speak to me again!"

"I give you my word, Beverly," began Remington, "I never thought it would go that far. I thought —"

But Beverly was half-way down the long corridor already. The two young men exchanged a shamefaced, frightened look.

"Who would have supposed," muttered Remington sulkily, "that the old fool would n't have seen through it, at second glance anyhow?"

THAT night two women watched by the bed where the Major had been lying since night-fall in a dull stupor, broken only by delirious mutterings.

He had been found wandering in the outskirts of the city drenched to the skin by the rain in which the day had ended, and unable to give any account of himself. From a letter in his pocket the officer who found him had discovered his identity, and summoning an ambulance had conveyed him to his home, while Aleck was still absent in search of him.

On one side of the bed old Molly alternately dozed and prayed; in the next room Aleck and Meg slept in their chairs, or woke to wait in terror and grief the summons they had been told to expect. Jocelyn alone felt no need of sleep. With tearless eyes she watched unflaggingly the haggard face on the pillow, catching eagerly at every muttered word, seeking some clue to what had happened.

The officer had spoken of a letter, but Jocelyn had searched vainly for anything that might account for her grandfather's condition. Molly had no information to offer; she had not heard the postman's ring, and knew nothing — except that the Major had walked away looking, as she expressed it "for all de world

like a bridegroom on his way to the church to meet his bride."

Towards midnight the delirium increased, the disjointed exclamations grew louder. What was he saying?

"A good joke—a capital joke—a famous joke on the old man! The 1st of April—why, any fool might have seen through it! The old man must be in his dotage! Why don't you laugh, everybody?" he demanded, fiercely, half-rising and glaring about him with wild, bloodshot eyes. "You need n't be afraid of hurting the old man's feelings. Laugh, I say! Laugh, fiends and angels—everybody—laugh, I tell you! See! I laugh too!"

With a peal of terrible laughter he flung himself back upon the pillow.

Then Jocelyn, putting together the tattered fragments of delirious speech, constructed something very near the truth. With a bitter

cry she flung herself down by the bedside, and laid her cheek against the poor restless hand that wandered over the counterpane, covering it with tears.

"They have killed you!" she sobbed. "They shall never be forgiven! Never!"

Over and over again the changes were rung by the stricken man upon the one theme, until at last stupor succeeded delirium, and the sufferer lay motionless, with closed eyes and failing pulse. For some hours this phase lasted, then suddenly the old man's eyes opened and brightened, a smile lit up his face, a smile of joyful recognition, of unutterable, divine content.

"Kate," said the white lips, a thrill of elation running through the clear, weak tone, "Kate, dear, that appointment—has come—at last!"

This time the Major was not mistaken.

Julia Schayer.

THE CHOICE.

WOULD I could choose the sweet and simple way!—

Could curb the spirit's will yearning for flight
To spheres unimageable, heavenly bright,
And in the shelter of thy bosom stay.

Thy love is like a clear consoling ray

That from some cottage window cleaves the night,
Bidding the guest to comfort, warmth, and light;—
I fain would enter did I dare delay.

'T is vain! a pearl- and emerald-studded car

Awaits; the charioteer, with streaming curls
And lustrous eyes, beckons—the pale earth swoons—

I mount—the wing'd steeds soar aloft, and far

From thy still home its freight the chariot whirls
Beyond the limits of the suns and moons.

Owen Innsly.

MUSIC.

OH, take the lute this brooding hour for me—

The golden lute, the hollow crying lute—
Nor call me even with thine eyes; be mute,
And touch the strings; yea, touch them tenderly;

Touch them and dream, till all thine heart in thee

Grow great and passionate and sad and wild.

Then on me too as on thine heart, O child,

The marvelous light, the stress divine shall be,

And I shall see, as with enchanted eyes,

The unveiled vision of this world flame by,

Battles and griefs, and storms and phantasies,

The gleaming joy, the ever-seething fire,

The hero's triumph and the martyr's cry,

The pain, the madness, the unsearched desire.

A. Lampman.

SAN FRANCISCO VIGILANCE COMMITTEES.

BY THE CHAIRMAN OF THE COMMITTEES OF 1851, 1856, AND 1877.

On the 14th of August, 1849, my brother and I rode from the Sierra foothills into the Sacramento Valley, intending to reach Sutter's Fort that night. Early in the forenoon we were overtaken by a horseman, a finely mounted, handsome fellow, who asked if we were immigrants. We answered, Yes. He welcomed us into the new country, and said he had arrived some months earlier. I told him that my brother, who was near by, and I were just arriving overland; that we had come from Salt Lake alone in about twenty days, for being well equipped we had made quick time; that he was the first Californian we had met, and, indeed, the first person we had seen in several days. I asked him if gold in California was a reality or a romance. He said it was an assured reality, and, as a ready proof, loosened his waistcoat and revealed a large, long, leathern bag strapped securely to his person, in which he said was about three thousand dollars in gold-dust, the result of his labor for a short time. He stopped his horse, opened his purse, and showed us the glittering metal. Enjoying my surprise and interest, he gave me several handsome specimens as a souvenir. I asked him if it was not hazardous to make such a display of his wealth. He answered, No, it was perfectly safe; that people were honest, or made to be honest; that there was no room in this country for thieves, and there was no such thing as highway robbery; there had been troubles in the country, but the worst men had been summarily punished, the others had learned better, and there was plenty for all who would work. He gave me many particulars about the country, the new population, the gold product; described the new towns, especially Sacramento, which had grown up on the river near Sutter's Fort, and whither he was then going; gave me the distances, and advised me of the best camping-grounds, and, his animal being fresher than ours, bade us good-by, and galloped on.

A few miles farther on, turning the point of a hill, a panorama of the grand, beautiful valley of Sacramento, the land of promise, opened its broad expanse before us, apparently limitless on the south and west, albeit revealing fringes of

trees skirting the streams below. Very soon we met wagons, horsemen, footmen in scores, Americans, Mexicans, Chinese (the first I had ever seen of these), all going to the mines, every man pushing on eagerly. It was altogether a stirring scene, sharply contrasting the quietude of the one thousand miles of mountain, valley, and desert we had just traversed. About 4 P. M. we reached Sutter's Fort, and, as directed, passed around it, forded the American River, which was low, and found excellent grass and a good camping-place where several groups of new-comers were already comfortably located. Having selected our ground and picketed our animals, our new neighbors came with the usual greetings and inquiries, to which we responded in kind, and I reverted to the horseman we had met in the morning, and to what he had told us of the condition of the country, abundance of gold and provisions, and of the safety of life and property. They said it was all true; that no one thought at the present time of taking anything that did not belong to him because of the fear of prompt punishment by the people. I said, "Then is life as safe as property?" They said property was perfectly safe, and life as safe as in any country where people behave themselves. Accustomed as I was to frontier life and to the value of swift and severe punishment, this ideal security for life and property surpassed anything I had ever seen, and made me fancy that Utopia had become a reality in this new western land, and I said, "Here you have, then, a truly golden age with halcyon days."

The second day, after having rested, I went to the new city of Sacramento, and found it a scene of activity and vitality. It was a town of tents, with a few frame buildings, altogether strongly resembling a huge camp-meeting, with many people camping in the open air. The streets were filled with men coming and going, wagons and pack animals loading from the well-filled stores; many vessels were discharging on the river banks cargoes of mining supplies and provisions of all kinds, and there was everywhere a full display of prosperous business and earnest life. New immigrants were daily arriving overland and by sea; surveyors laying out building lots, auction sales of lands, cattle, and merchandise loudly proclaimed

cheerful activity everywhere. Sales were for cash, the currency of the country being placer gold-dust at \$16 per ounce if clean and pure, and \$15 or less for that which was not so good, supplemented by Mexican dollars and Mexican gold doubloons at \$16 each; there was very little European or American coin. I noticed large piles of goods outside the stores and tents, unprotected, and I asked if they were left out at night and were safe. The answers were all affirmative. The doors of houses had no locks, or they were unused; the tents had no fastenings, yet there were no losses of property, as every trespasser knew that in theft he would hazard his life.

This I afterward found was the condition all over the country. The miner without fear or hesitation would leave his bag of gold-dust under his pillow and go to his camp for a day's work. He would leave his gold-diggings and rocker with hundreds of dollars exposed without fear of loss: all, or chiefly, the result of very summary punishment inflicted upon lawless men in San Francisco the year before, and of the trial and quick execution of a few throughout the country when found appropriating to their own use what did not belong to them. This was the common law of the country.

This condition of affairs continued through the winter of 1849 and the spring and early summer of 1850, during which time a large additional immigration came in, embracing numbers of our best people, and including many families of early pioneers, all bringing a sense of home-life and sanguine anticipation of future comfort and happiness. But unfortunately this tide was met by a flow of the worst element in the world, chiefly from Sydney and other Pacific Ocean ports, and, as a little foul matter will taint a large stream, so this matter seriously changed and endangered current affairs in California. Reports of robberies and assaults soon became common; again the public mind began to be excited over the general lawlessness. Wealth was increasing, business prospering, solid improvements progressing throughout the city and State; people were hopeful on the one hand, and fearful on the other, for while our golden era was bright, we had many sad proofs that our halcyon days had departed. This was no longer Arcadia.

The rapid and continued increase of crime in San Francisco impressed on every thinking man the conviction that some more vigorous action of the legal authorities was imperative, and must be stimulated and insisted upon, or self-preservation would make it necessary for the people to take the matter into their own hands, and assert the law and establish order in their own way. The police were notoriously inadequate and inefficient; the courts had been

accused of corruption; the prisons were small and insecure, and it was boldly proclaimed through the streets that with packed juries and venal judges, false witnesses and dishonest officials, our criminal courts had become a failure and a reproach.

On Wednesday night, February 19, 1851, the city was thrown into intense excitement by the report that a bold attack had been made early in the evening upon the store of Jansen & Co., merchants, Mr. Jansen having been brutally assaulted and left on the floor insensible, it was supposed dead, and the house having been robbed. Arrests were soon made, and the person supposed to be guilty, one Burdue, was lodged in prison. A large crowd gathered around that building and made threats to destroy the premises and hang the offender. The officials made conciliatory appeals and the crowd finally dispersed, though dissatisfied, and it was soon reported that on Sunday morning, the 23d, the people would assemble *en masse*. In the early forenoon, I walked quietly toward the premises, and was surprised to find a great crowd of people already on the spot, while others were pushing in from all directions, many bearing side-arms. The eyes of the people I met showed that they were thoroughly aroused, and the clenched hands and quick gestures of many gave evidences of irritation and rage.

The mayor and a few leading citizens were vainly trying to calm the excitement by guaranteeing to hold the prisoner securely, promising a speedy and vigorous trial, and asking the people to disperse; but there was no faith in these promises. All seemed impatient of delay; no one would leave. On the contrary, all moved forward in a solid, sullen mass, surrounded the building, and pressed against every entrance. Though there seemed to be no concerted plan of action, no leadership, yet there was plainly a common thought and a common object. It was evident that unless the people were quickly diverted, and in some way satisfied, they would soon take possession of the building, seize the prisoner, and execute him without a hearing or form of trial. No available power could stop them. I always had had a horror of a mob, and its wild and hasty excesses, and it occurred to me that a middle course might be adopted, and a fair and speedy trial be secured by a court of the people, organized on the spot. So I pushed my way to the front balcony, which overlooked the people below, and catching the ear of the mass, I proposed that those present should immediately form themselves into a court within the building; that the prisoner should be brought before them, counsel on each side allowed, and testimony be taken, and that the

trial should proceed fairly, calmly, and resolutely, and, if the prisoner should be found innocent, that he should be discharged and this intense excitement allayed; but if he should be found guilty, that he should be hanged before the sun went down.

Never in my life had I heard a more instantaneous and tumultuous shout of applause. It was light breaking through the dark overhanging cloud. It solved the problem and satisfied the longings of the people. This note had struck the chord and every nerve seemed to vibrate in harmony. All citizens who could find room were invited to come into the building, while others formed a guard without. Mr. Spence, a prominent merchant, was selected as judge, and twelve well-known citizens formed the jury. Three prominent lawyers, McAllister, Benham, and Shattuck, volunteered to defend the prisoner. I asked for counsel for the prosecution, when the house insisted upon my taking that position. The trial consumed about six hours. The hall was packed to repletion, and the streets surrounding the building were filled with a compact mass of people, about ten thousand in all. There was great impatience and fear of a failure in the trial, and that the prisoner would escape. Several times the people became so clamorous that I was compelled to leave the court-room and make a short speech to satisfy them that everything was going well. Happily, I always succeeded in restoring quiet. Whatever I said and did was satisfactory. So dense was the crowd that, on making my way to the front of the building, I was literally forced to walk over the heads and shoulders of the thickly packed mass of people.

Witnesses were thoroughly examined; the facts of assault and robbery were clearly proved; the evidence was so plainly detailed as not to admit of doubt. Counsel were heard on both sides, the trial continuing until about dark, when the jury retired.

After waiting patiently several hours, toward the middle of the night I was amazed to hear that Judge Shattuck had secretly secured admittance to the jury-room, had made an *ex parte* appeal, and secured a disagreement.

When it was found that the jury had disagreed, the consideration came as to what next should be done. It was within our power to have yet dealt with the accused as we chose, and there were earnest advocates for prompt and summary action, who declared that justice was being tricked and cheated, and it was our duty to prove ourselves more than a match for such villainy, and that it would be but right to put the chief actor in this attempt alongside the criminal. But I said, "No, a thousand times no. Better by far that it should be so, than that we should make a fatal error. We had

done our duty, our whole duty, honestly, loyally. Many before us had thought their prisoner the guilty party, and he had proved not to be; and as our action had been unusually prompt, our time for examination and comparison unusually short, it did not become us to act except on the most unquestioned proof. We could not afford to make a mistake, and surely we could not afford to have innocent blood on our hands. With all my earnestness, I preferred that this prisoner should go his way, or that he be left to those who had promised a full, fair, and impartial trial. We knew the man now too well for him ever to become dangerous."

These views were adopted, and the court and the remaining part of the assemblage adjourned, and the prisoner was left in charge of the county officers. Thus ended the famous "Burdue trial."

The result of this trial was not as fortunate for the safety of life and property as were similar proceedings in 1849. Soon the announcement of outrages in different parts of the State became numerous. In San Francisco the matter grew serious, and there was much discussion as to the remedy. The best people were wholly absorbed in their personal affairs; the worst were following their criminal instincts without fear and without obstruction.

On the 3d of May, 1851, a great fire occurred that destroyed almost the entire city and in which a hundred lives were lost. There were good reasons for believing that the fire was the work of incendiaries who had sacrificed these valuable lives and millions of dollars' worth of property for the sake of plunder, and a very strong and bitter feeling grew up against the newly arrived population of criminal classes. The conviction grew stronger every day that something should be done by the people themselves to rid the city of incendiaries and robbers. With the view of immediate protection, a number of mechanics, merchants, and other respectable citizens agreed to form a private patrol, each member of this volunteer police to take his particular beat, and to be on duty a certain number of hours every night. In case of emergency, the entire force was to rally at a point and be prepared for duty. The effect was good, but the result was not adequate: the criminal classes continued their outrages.

A second great fire occurred on the 3d of June following, and arrests were made of persons believed to be the incendiaries. So violent was the feeling of the people that attempts were made to hang the prisoners, but the mayor and officials promised that they should be severely dealt with. The grand jury was then in session, and found a true bill against

some of the accused, but by technicalities the indictments were quashed and the persons disappeared.

THE VIGILANCE COMMITTEE OF 1851.

THE want of a strong organization among those who wished to preserve peace and enforce the laws was severely felt. Those who had the largest interests at stake felt that unless there could be united action and control, there might be introduced a system of mob law, which would ultimately be more dangerous than the existing state of affairs. It was for this reason that, on the 10th of June, 1851, an organization of prominent business men was effected, and about two hundred names were enrolled under what was styled "The Committee of Vigilance of San Francisco." The objects of the committee were "to watch, pursue, and bring to justice the outlaws infesting the city, through the regularly constituted courts, if possible, through more summary process, if necessary." Each member pledged his word of honor, his life, and his fortune for the protection of his fellow-members, and for purging the city of its bad characters. After arranging for a concert of action, watchwords, and a signal to call the members to the rendezvous, which was three taps of a fire-bell, the committee adjourned for the evening.

Scarcely half an hour had passed before the bell was tapped. On reaching headquarters I found a number of gentlemen, and soon after there was brought in a very large, rough, vicious-looking man called Jenkins, an ex-convict from Sydney, who had been caught in the theft of a safe from a store. He was well known as a desperate character who had frequently evaded justice. The committee was organized immediately into a court, and Jenkins was tried for the offense within an hour. The evidence was overwhelming; he was promptly convicted and sentenced to be hanged that night. Jenkins's bearing throughout the trial was defiant and insulting, and he intimated that his rescue by his friends might be expected at any moment. We were notified by our officers that already the roughest and worst characters throughout the city were mustering in force to resist the committee. At the same time scores of our best citizens came forward and enrolled themselves as members, while others pledged their support in anything we might do.

I strenuously resisted the proposition to execute Jenkins that night, as I held it cowardly to hang him in the dark in such hot haste. I proposed he should be held till next morning and then hanged in broad daylight as the sun rose. Only a few agreed with me; there was much nervousness; the very circumstances of

his crime having been committed at the moment of our organization and in defiance of it, and the threatened attack on us by abandoned criminals, all tended to impress the committee with the necessity of prompt action. Seeing that he must be hanged, I moved that the prisoner have the benefit of clergy. This was granted, but when the minister was left with him, the hardened criminal heaped the vilest insults on his venerable head. This hastened his doom, and his career was quickly closed.

The next morning the work of the Vigilance Committee was heralded throughout the State, and hundreds of citizens came forward and tendered their approval of our acts and asked to be enrolled in our ranks. The unexpected arrest and quick execution of Jenkins spread consternation among all his class. The Governor of the State, McDougal, issued a proclamation and maintained a nominal opposition to the committee, but took no active measures against it. Many arrests were made of desperate characters, and where clear proof of murder within the State was lacking, it was decided that banishment or corporal punishment should be the penalty. During the active operations of the committee, four men were hanged, and about thirty were banished. Nearly all were from Sydney or other British colonies, and as far as possible they were returned to the places from which they had come.

After a session of about thirty days the committee, finding that the country had been purged of a goodly number of the worst people, determined to adjourn quietly. It was decided not to disband, but to preserve the organization ready for any emergency. Happily there was no call for its services for some time; in fact, it was four years before the necessity of such a committee was again felt by the people of California, and brought forth finally the famous Vigilance Committee of 1856.

As contemporary testimony to the value of the work of the first Vigilance Committee, and its significance as an example of self-government, I quote the following editorial from the New York "Daily Tribune" of July 19, 1851:

. . . The summary proceedings of the San Francisco Committee of Vigilance, in the trial, condemnation, and execution of the thief Jenkins, are not to be regarded in the light of an ordinary riot, much less as an example of hostility to the established laws, heralding disorganization and anarchy. Seen from the proper point of view, it is a manifestation, violent, it is true, of that spirit of order which created the State of California. . . . San Francisco presents, therefore, the singular spectacle of a community governed by two powers, each of which is separate and distinct from the

EXECUTION OF JOHN JENKINS. (AFTER A LITHOGRAPH OF THE TIME, PUBLISHED BY JUSTH QUIROT & CO.)

other. They cannot come in conflict, since there is no aggressive movement against the law on the part of the committee, and no attempt on the part of the regular authorities to interfere with the action of the latter. Public opinion universally upholds the course pursued by the committee. This course, under the circumstances, cannot be called mob law or lynch law, in the common acceptance of the term. It more nearly resembles the martial law which prevails during a state of siege.

At this distance we will not venture to judge whether the circumstances demand so merciless a code. But we are sufficiently familiar with the characters of the men composing the Committee of Vigilance, to acquit them of any other motive than *that of maintaining public order and individual security*. We believe they will exercise the power they have assumed no longer than is absolutely necessary to subvert these ends, and that their willing submission to the authority of the law, when the law shall be competent to protect them, will add another chapter to the marvelous history of their State. In spite of these violent exhibitions of popular sentiment, the instinct of order, *the capacity for self-government, is manifested more strongly in California, at this moment, than in any other part of the world.*

THE GREAT VIGILANCE COMMITTEE OF 1856.

WHEN I returned to San Francisco in January, 1856, after an absence in New York of
VOL. XLIII.—18.

about two years, I found a great change and much public excitement in social, political, and financial affairs. There had been a severe financial crisis in 1855, and affairs were still very unsettled. The "Bulletin" newspaper, edited by James King of William,¹ had undertaken local reform, and was boldly assailing all evil-doers who had again become aggressive. Very recently United States Marshal Richardson had been killed by an Italian gambler named Cora. The murderer had been imprisoned and tried, but all efforts to convict him had failed. The excitement over the general lawlessness and the impotence of the courts increased as the months went by, but a crisis was reached only by the assassination of Editor King in the streets, on the evening of the 14th of May. He was shot down by an ex-convict named Casey, whose infamous New York record the editor had exposed. The community was immediately thrown into intense excitement, and the engine-bell on the Plaza was rung—the familiar signal of the old Vigilance Committee.

After a hasty dinner I went to the Plaza, which I found crowded with excited citizens. Members of the old committee sought me in

¹ This designation was chosen by Mr. King to distinguish himself from many others of the same name in San Francisco.—EDITOR.

numbers and urged me to organize a new committee. I declined these importunities; several meetings were held in different places, and urgent appeals made not to allow a repetition of the failure of organization as was done a few months previously when Cora killed Richardson. The result of all was that I finally consented to take charge and organize the committee, provided I should have absolute control—authority supreme. We organized, and within twenty-four hours we had fifteen hundred members, all well-known leading men of the city. They took a strong oath pledging their lives, fortunes, and sacred honor to the cause, and promising to stand by one another under all circumstances, and not to divulge any transactions of the committee. The organization was to be entirely impersonal, and each man was to be known only by his number. An organization in military companies, well officered, was perfected the first evening. Within two days after the first meeting 2500 men were enrolled and equipped with arms, while drilling was carried on constantly day and night. Such was the zeal and intelligence of all, that soldiers were formed of men who but a few days before hardly knew how to handle a gun.

While this work of organization and preparation was progressing we were informed of numerous counter movements by the opponents of the committee. Word was brought that the roughs were organizing in large numbers, arming, and threatening with determined energy to defend Casey, Cora, and their friends, at all hazards, and to lay the city waste if need be to accomplish that end. The next day it was developed that a strong effort was being made

by the mayor and others to organize and bring into action all the militia of the State that were available. The larger and better part of the militia in the city had, however, already joined the committee. Renewed and specific threats were made on the life and property of all who were members of the committee, and a determination was announced to crush the new movement at any cost of life, money, or property.

It thus became too evident that the committee had to prepare for more serious work than was anticipated, or by rights should have been forced upon them. James King of William was honest, brave, and terribly in earnest, but often rash. Unhappily, he had arrayed against him several classes of people. He had severely, though in the main justly, castigated that portion of the press that upheld or apologized for excesses or irregularities in political affairs. He had aroused a Roman Catholic influence hostile to himself by ill-advised strictures on one of their clergy. He had invited the bitter animosity of a large portion of the Southern element by the stinging severity of his criticisms on them in their official capacity, and his denunciation of them as the Chivalry, and the unworthy Chivalry, who had captured and held, or virtually controlled, for their own benefit the offices of the city and State. All of these elements, separately and combined, were inimical to King, who by his impetuous methods and reckless personalities had unfortunately and needlessly made himself many bitter personal enemies. Thus, the committee was assailed as his champion by all these parties, when in fact it was not such, but was merely the champion of justice and of right—the child of the necessi-

JAMES KING, OF WILLIAM. (FROM A DAGUERRETYPE IN POSSESSION OF HIS SON CHARLES J. KING.)

ties of the hour. The committee scarcely thought of or had in view King's personal relations with his former antagonists. It merely looked at the state of affairs in the city and country, and the evils that threatened, and went forward in the direction of the work attempted a few months before, when Cora killed Richardson. Indeed, such was the condition of the public mind at this time that if, instead of King, any other prominent man had been assassinated, a similar demonstration would have ensued, though it would not probably have so clearly divided the community or brought such bitter opposition.

While on previous occasions the city and State authorities had been conservatively passive, they were now unexpectedly active and aggressive, the moral of which we knew might have weight with weak, doubtful, and negative people, and even with many of the best. This warned us to prepare for changes which caprice

of opinion, the turn of fortune, or the course of time might bring forth against us. We felt strong in our resources, numbers, cause, and courage. We had about seven-eighths of the people with us.

With the opposition were some of the best people of the country. Their party and friends had all the city and State offices; they had with them the law and most of the lawyers, and all the law-breakers. Their chief hope was in legal, State, and Government aid. We asked nothing but to be understood and judged rightly.

Our aims and position were soon made plain and satisfactory to the leading army and navy officers on this coast and to the Government at Washington. They soon understood us and always left us to complete our work in our own way. On May 16 I was waited upon by some gentlemen who said that Governor J. Neely Johnson had just arrived,

and was very anxious to see me. He was at the Continental Hotel, and would come to any point that I might indicate; he did not know where I was, or he would have waited upon me at once. I replied that I would do myself the honor to call upon the Governor at his hotel. I did so, and the question of the work of the committee was broached immediately. He asked what we wanted. I answered that we wanted peace. We would like to have it without a struggle, but if it must be at the cost of war, then we must have war. He asked what we wanted to accomplish. I told him, very much what the Vigilance Committee of 1851 accomplished — to see that the laws were executed upon a few prominent criminals whom the officers of the law had allowed to go unpunished; to drive away from the State some notoriously bad characters; to purify the atmosphere morally and politically, and then to disband. I told him the names of the people in this organization were a guarantee to him that there were no personal aims, or ambitions, nothing in view except the work of the public good; that as an officer of the law, and an observer, he must be aware of the frightful condition of affairs throughout the State, especially in San Francisco; that it had been apparent to all that this could not be much longer endured, and that the climax had now arrived in the striking down of King; that the people had resolved that they would correct the mischief if possible, and that they believed they could do it; that done, they would retire from all participation in such matters, and leave the regularly constituted authorities to do their work, if they would. "Now, Governor," said I, "you are called upon by the mayor and a class of people here to bring out the militia and try to put down this movement. I assure you it cannot be done, and if you attempt it, it will give you and us a great deal of trouble. It is not the way to treat the question. Do as McDougal did; see, as he did, that this is a mere local reform, intended to correct local abuses. Allow us to take up the work and get through with it, as he did, without anything more than a formal opposition by the State. Do your duty in issuing your proclamation and manifestos, and maintaining formally the dignity of the law, but leave to us the work, and we shall get through with it in a short time and quit, and quit gladly." He slapped me on the shoulder, and said, "Go it, old boy! but get through as quickly as you can. Don't prolong it, because there is a terrible opposition and a terrible pressure."

I told him I had just realized the position that King had stood in, and that all of King's opponents, or most of them, would become the opponents of the committee, but we could not

retire from the position we had taken; that we did not want to be in opposition to the State; that we were as law-abiding people as any in the world, as long as there was any law; that our real object was to see the laws carried out and executed, and if the officers of the law would not carry them out and execute them, then it devolved on us to do it; we did not want to quit our business, our vocations, and our homes to do all this, but we were compelled to do it, and if he could see his way clear to maintain his status as Governor on the record, to do it by all means. We did not want a single court to adjourn, a single officer to vacate his position, nor to surrender his rights nor fail in his duties. He said he appreciated the situation, that he knew me very well (we had always been close friends), and he knew those associated with me; he had been called down from the State capital; he was now satisfied, and he would leave the field to us in confidence.

About two hours afterward, I was busily engaged at our headquarters when a messenger brought word that several gentlemen, Governor Johnson, Mr. Garrison, and others, were in the anteroom and wanted to see me particularly. Johnson's manner was much changed; he had evidently come under the influence of the opposing party. He asked what we were going to do, and if this trouble could not be settled, addressing me as if he had not asked the same question a few hours before in our former interview. I answered, and naturally addressed the whole party through him, that the people of the city and State were tired of having citizens shot down and other outrages committed as they had been, and were no longer inclined to endure them. He agreed with me, and was of my opinion as fully as any one could be, but he thought the courts could remedy all that; we had good judges and good men, and the people need not rise up in a mob and obstruct the execution of the laws. I told the Governor that ours was not a mob, that it was a deliberative body regularly organized, the officers and men pledged to their duty,—it was a government within a government, if he liked,—and that he must not regard it as a mob, because it was clean and clearly out of the sphere and atmosphere of mobocracy; that we had not seen any laws executed in San Francisco for a long while, and it was because of this failure that we felt called upon by the most imperative sense of duty and of safety to undertake it ourselves; that if it were done by the officers of the law, there was no portion of the citizenship of the State more prompt to aid and support them than the Vigilance Committee would be. He then proposed that we should hold ourselves together if we wished, but leave the trial of Casey and Cora to the regular courts, and of-

ferred to pledge himself that they should have a speedy and fair trial, and if the evidence adduced was sufficient, that they would be executed. I replied that the people no longer had confidence in the officers, that too many of them were unfortunately friends and intimate associates of these very prisoners. I repeated my suggestion that he allow the committee to do

This interview was the next day reported in different forms, and brought forth from the other parties many disingenuous statements. Johnson's dorsal vertebrae proved too weak to stand by his word, and he never recovered; yet the status remained unchanged until Sunday morning, the 18th of May, when the Executive Committee determined on further and

SURRENDER OF CASEY AND CORA TO THE REPRESENTATIVES OF THE VIGILANCE COMMITTEE, MAY 18, 1856.

its work and then disband. Now they had no patience to wait, they were thoroughly aroused and were determined to go through with the undertaking, and there was not power enough in the State to stop them.

I then asked three members of the executive to join me, and reviewed and repeated what had been said, all of which was clearly understood. It was then asked of us if nothing could be done. And the answer was, Yes. We were solicitous about the safety of the prisoners, feared they would be spirited away, and with a view to their safety we proposed that a small force of our men be placed in the prison as an additional guard, and we pledged ourselves not to take the prison or make any movement against it without giving the Governor notice, all of which was agreed to and complied with.

prompt action, and sent the Governor this communication:

We beg to advise you that we have withdrawn our guard from the County Jail.

The guard was soon after withdrawn from the building. This was a formal and necessary step to conclude our truce with the Governor. Soon thereafter the prisoners were demanded at the hands of the sheriff, and supplementing the demand the troops of the committee, numbering about 3500, marching by different routes, arrived at and surrounded the jail, demanded the prisoners, who were taken for their trial, which became an all-absorbing question and topic, and paralyzed the opposition.

The trial of Casey and Cora was soon begun and carried on with all the attention to legal forms that marked the trials of the first

EXECUTION OF HETHERINGTON AND BRACE AT THE HEADQUARTERS OF THE COMMITTEE, CALLED "FORT VIGILANCE."

[This building was also called "Fort Gunnybags," from the material of the breastworks in front of it. On the roof were cannon and sentinels, and the alarm-bell of the committee.]

committee. No outside counsel were permitted, but all witnesses desired by the prisoners were summoned and gave their testimony in full. Both were convicted of murder in the first degree and sentenced to be hanged. The execution took place on the morning of Mr. King's funeral. The committee's entire military force occupied the streets near the headquarters. As King's funeral train moved, all the bells in the city chimed a solemn requiem. The military force was brought to present arms, and then poor Cora and Casey were swung into eternity from the scaffold in front of the building. That great and solemn act, due to self-defense and the safety of the community, was fulfilled, and these turbulent spirits who had defied the laws of God and man paid the last and severest of penalties. No one more than the chief actors in this drama felt the gravity and solemnity of the occasion. No one would more gladly have been acquitted of these duties than they. But there was not a scintilla of hesitation, doubt, or fear. The work was done under solemn dictates of duty, even with pure Christian spirit, and while technically outside the law, with due and solemn reverence for the law as it should be executed.

At a meeting of the committee on May 20, three members were delegated to wait on the Governor and on the mayor, and assure them

that the committee had no desire or thought of interfering with the regular discharge of their duties, and only desired to take cognizance of outrageous cases of crime and rowdiness which the laws had been tardy in executing or could not reach; that we did not encroach on the regular execution of law or the maintenance of order, and would not, provided the laws were enforced or carried out; but we desired peace and order, and it was that consummation we were aiming at, and we would be pleased to see all legally constituted authorities proceed in civil and criminal cases as though this committee were not in existence. We had not desired and did not desire to encroach on the civil authorities whenever they were properly discharging their duties. Such was the message.

The next important work was the action to be taken with regard to notorious ballot-box stuffers and other desperate characters. They were a curse to the country. Every one admitted it, but no effective action had been taken against them. In many cases they held the polls at election and attacked, maimed, and terrified those voters who were opposed to their friends. If arrested, such was the dread they had inspired, and so great their influence with the courts, that conviction was almost impossible. This immunity from punishment increased

their insolence and violence, and it was evident that no reform could be made while they remained in the State. What was to be done with them? They could not be hanged; they would be a source of expense and trouble; safe and satisfactory imprisonment was plainly impracticable. It was therefore suggested that if, after fair trial, the charges against them were proved, no course would be so satisfactory and safe as banishment, with a warning never again to return under pain of death. This was adopted, and a black-list was made of all these notorious characters. Evidence was collected, and orders were soon given for the arrest of these men wherever they could be found in the State. They were tried, convicted, sentenced, and deported, many of them as first-class passengers, by sailing ships and steamships, at the sole expense of the committee, and in a style far above their deserts; this was not appreciated, but flattered and exalted them to the belief that they were important personages and had suffered great damages, and they brought suits against the committee. Singularly, or perhaps naturally, these suits were only brought by those who were best treated. Those who were shipped in the steerage never brought suits, and were never afterward troublesome.

So rapidly were the remnants of the work before the committee cleared away, that on June 18 a special committee decided that on

the 4th of July the General Committee would adjourn, the executive only continuing to meet for needful business. We believed we were far enough along to finish our work speedily; but we were disappointed, for on June 21 there was precipitated upon us the most unexpected and the severest task of the year. Judge Terry of the Supreme Bench of California, a violent, hot-headed man, and an open denouncer of the committee and its efforts, quitted his bench and neglected his duties at Sacramento to come to San Francisco to join in the contest against us. In a quarrel over the possession of arms, Terry plunged his bowie-knife into the neck of an officer of the committee named Hopkins, inflicting a wound which at the time was thought to be mortal. This news came like the bursting of a bomb-shell. We saw instantly the magnitude of the new labor and the new responsibility thrown upon us. It was not only to vindicate the committee law, but to punish the presiding judge of the Supreme Court for violence to one of our own people. Orders were at once given and promptly executed for his arrest, and the arrest of all others who were with him.

Our police and military systems were now equal, if not superior, to any on the continent. Within an hour's time we could put in line 5700 men, well armed, equipped, and officered, ready for any service. And let it be noted that all were volunteers, without pay, direct or

indirect, for their services, the committee providing only material — arms, munitions, transportation, and commissary. In these ranks were bankers, doctors, lawyers, merchants, mechanics, miners, ministers, sailors, soldiers, salaried men, day laborers, and nearly all the men of property. All cheerfully sacrificed every interest for the cause.

Judge Terry was regarded and treated as a high State prisoner. His trial was delayed by the uncertainty of the recovery of Hopkins, and by the efforts of Terry's friends to make a compromise. All these efforts failed, and on June 25 the trial began. It lasted nearly a month — a long, wearisome, unsatisfactory piece of work. Terry was convicted of resistance to and assault upon the officers of the committee, but as the wound inflicted did not prove fatal, and the officer recovered, the usual punishment in the committee's power to inflict not being applicable, it was finally decided to discharge him. And it was resolved that the interests of the State imperatively demanded that he resign his position as judge of the Supreme Court.

While Terry's trial was going on, the committee had handed over to the authorities a number of men arrested for crimes and misdemeanors, and only two prisoners were held — Philander Brace for the murder of Captain

West, and Joseph Hetherington for killing Dr. Randall. Both were cold-blooded crimes committed in open daylight, within the city, and demanded the full penalty. The men were tried fairly, sentenced to death, and executed. Thus ended the capital punishment of the Vigilance Committee of 1856.

On August 8, 1856, the Executive Committee decided to close their labors, and on the 18th a great parade of all the members was held, and the active work of the General Committee ended *sine die*, the Executive Committee, however, continuing in session to close up financial and other affairs.

The personnel of the committee were men above the average. They were selected for their worth, integrity, and good standing in the community, and no man was admitted whose record was not clear in these particulars, and if he failed in them he was quietly retired. Politics, creed, nationality, or profession were not considered, not thought of. The largest element of the committee was of northern and western men, chiefly representing the mercantile, manufacturing, and vested interests, but embracing every profession and pursuit. It is estimated that about eighty-five per cent. of the population of the city and State were of the committee, or with it as friends, adherents, and

supporters. The little minority, however, were ever active, persistent, and plucky, and made their numbers count as often as possible. The church, as in all such commotions, advised moderation and good order, and maintained a dignified conservatism.

A comparison shows the coincidences of the work of the Vigilance Committee of 1851, and that of the great committee of 1856. In 1851 four men were hanged for high crimes, all clearly and unmistakably proved. Two of these were taken by surprise-parties from the city prison on Sunday morning during church hours, and immediately taken to the committee's headquarters and hanged, their trials and the proofs against them having been previously completed. The other two were held at headquarters, and were more deliberately executed. This committee also banished about thirty bad characters, with notice never to return under penalty of death.

The great committee of 1856 also hanged four men, all clearly guilty, and all convicted of murder in the first degree. Two of these, Casey and Cora, were taken from the same county jail which confined the two taken in 1851. We also banished about thirty.

The chief difference between the work of the two committees arose from the fact that the expatriated of 1851 were mainly ex-convicts from Sydney, while in 1856 more Americans by birth and adoption were sent away, and these were more tainted by political corruption than the others. Another marked difference was that Governor McDougal in 1851 bowed to what he thought was the public will and its demands, and kept faith in his promises not to interfere with the committee, except in form, if he could possibly avoid it; while Governor Johnson in 1856, after making the same promises, was swerved from his purpose and joined in opposing the committee, which greatly increased their labors and their influence, and prolonged their existence. Another point of difference was that in the later organization the reforms needed in the community were far more radical and complete than were those carried into effect by the first committee.

The committee of 1851 completed its work and adjourned within thirty days, and never again convened. The committee of 1856 required three months' service for the entire force, and the executive continued its sessions for a long while thereafter. The committee of 1851 had about 800 members all told; that of 1856 had about 8000 enrolled, with an equal number of active adherents, and earnest friends and supporters.

¹ For further discussion of the San Francisco Vigilance Committees, see H. H. Bancroft's "Chronicles Vol. XLIII.—19.

The conclusion of the Vigilance Committee of 1856 brought a complete revolution, politically, and financially. At the general election occurring soon after, the old political régime with its retainers was retired; the old "hacks" were turned out and put to grass, and but few of them ever saw the "crib" again.

A new era followed; the "people's" party swept everything before them and gave the city the delightful novelty of an honest, non-partizan, and economical administration, which continued for about nine years. It lowered taxation, yet introduced economies which in time so radically reduced municipal indebtedness, that the total of the city's obligations outstanding has since then rarely exceeded the amount of a single year's tax levy. Neither State nor city debts have since increased and are in fact practically nominal. The city's total net debt on June 30, 1891, was \$618,000, while the tax valuation for the year is \$411,000,000, and the tax to be collected about \$3,900,000. No other city in the United States can make such a showing as this.

While a perfectly honest and pure administration was not attained, yet so superior was it to the old, so relatively pure, as to make it seem well-nigh perfect. The reforms of 1856 took deep root, and in their vigor have remained unimpaired to the present day.

The judiciary from that period have done their duty. The people of the country have enjoyed general security of life and property. The political parties are closely balanced, and in San Francisco and the cities generally, since the committee of 1856, partizanship has been largely disregarded.

The credit of the city, State, and people, which before was all uncertain, soon after took a foremost rank, which has since been firmly held and maintained.

THE SAFETY COMMITTEE OF 1877.

For twenty-one years the good influence of the great Vigilance Committee endured. Then came a movement in July, 1877, the importance of which has never been appreciated, either in California or elsewhere.¹ It was the direct outgrowth of the railway strikes and socialistic agitation in New York, Buffalo, Pittsburgh, and other large eastern cities. At first it was thought no outbreak would occur in San Francisco, even though the Chinese question was troublesome, but on July 23 Mayor Bryant and Chief of Police Ellis, having unmistakable evidences of very serious trouble, called on General McComb, Commander of the State forces, and requested him of the Builders of the Commonwealth," Vol. I, pp. 336-379.

to hold his entire force in readiness to support the peace officers. General McComb, fearing that the militia would not be able to cope with a large riotous element, called a public meeting of leading citizens, and asked their organized aid in protecting the city. I was called to the chair, and on motion of Mr. D. O. Mills and by unanimous vote was given charge of the entire movement, with absolute control. I at once appointed Committees on Finance, Arms, and Enrolment, and in a few hours the organization showed a strong force. The work in many respects was a repetition of that of the earlier Vigilance Committees, unhampered by any opposition from within or without. It was found that the larger part of the guns and ammunition in the city had been bought up during the previous week by unknown persons. Governor Irwin came promptly to the city, approved my plans, and supported my movements. Urgent despatches were sent to President Hayes and to the Secretary of War, asking for arms and ammunition from the Benicia Arsenal, and for the presence in San Francisco harbor of the United States vessels at Mare Island Navy Yard. Both requests were promptly complied with, and within twenty-four hours we had 1760 rifles and 500 carbines with ample ammunition, and the next day three war vessels were ready to furnish aid.

The object and intent of our assembly being to reinforce the civil authorities, and in no way to assume any other power than that of a citizen posse under their formal control, it was my duty to provide men at once, and fit them for the service. Rolls of membership were prepared and opened for signature, a pass-word was given, badges marked "Committee of Safety" were ordered to be distributed to the men, and, under a general authority given by the mayor and the chief of police, our members sent on duty were sworn in as special police. It was my specific aim, and I made it my duty, to confine the powers of each member to aiding the police; and in the whole action of the force and patrol I allowed no step to be taken except by direction and request of the peace officers, conveyed through me.

The membership increased rapidly. On the morning of the 24th we established our general headquarters at the large Horticultural Hall, Stockton street, arranged complete telegraphic communications, ordered all forces to rendezvous there, and began the work of military and semi-military organization and discipline. Although it had been my object first to provide arms to cover every necessity, I at the same time determined to dispense with their use as far as possible. I appreciated the difficulties often arising by having military forces in the presence of mobs, and believed they should be

employed only as a last resort, when they are needed for actual and effective service. This was in harmony, too, with the nature of our call and organization, to act in support of the police and not of the military. I accordingly gave orders for the purchase of six thousand hickory pick-handles, to be shortened, and converted into large police clubs, and to arm every man as a special policeman with clubs and side-arms. I then ordered the entire force into company organizations of one hundred, to select their own officers, and report to me for confirmation. As soon as these were approved, all were ordered under drill, and instructions and general discipline, and kept busily at work within the hall when there was sufficient room, and in the streets adjoining, if room were needed. Before night we had a large and effective force rationed by the Commissary Committee, and we sent out details for active duty, under orders of the chief of police.

An intense feeling existed throughout the city on the night of the 25th, and as the criminal and lawless elements were gathered in crowds and squads in every part of the city, causing much annoyance and fear, I consulted with the chief of police as to the propriety of arresting these people, and keeping them in confinement during the course of the trouble, but we found that the prisons and jails would accommodate only a few, and that there was danger to those already confined there for various offenses. I consulted with the commanders of the vessels of war lying off the city front, and they offered to care for and confine on board their vessels such as might be sent to them, to the number of 1500, and if more, to place them on Goat Island and patrol the island with their small boats. The idle and lawless element, hearing of this movement, and fearing to be gathered in by the police and naval forces, left the city in large numbers, and for days the authorities were in receipt of telegrams calling their attention to the great number of strangers, evidently rough and lawless men, that were reaching the villages and suburbs near San Francisco. Meantime I learned that if these arrests were made, immediate legal action would be taken in behalf of the arrested parties; the *habeas corpus* and jury trials would be brought into play; complications would arise that would give us greater trouble than to meet these forces face to face and treat them effectually on the spot, which would greatly simplify and shorten the work, and render it much more effective than to have this class thus pose as martyrs of deportation.

Hearing that there were more arms in the city than had been reported to me, I caused a careful and reliable survey to be made of the gun-shops, so as to secure control of the arms and munitions against capture by the roughs, and I shipped load after load of material to the men-

of-war in the harbor, together with the guns that were lying in various foundries and chandler-shops along the city front. In the establishment of Little & Keadings I found such a large quantity on storage that I deemed it best not to attempt to move this supply, and therefore, with their consent and approval, I left a heavy guard in and around the building, with careful and considerate officers in charge, with imperative instructions, as a last resort to blow up the building.

Tuesday night passed in these general labors of organization and supply, and on Wednesday, the news from the East still continuing alarming, it was decided to effect ward organizations, to divide the forces now enrolling into detachments and squads, well officered, with orders to patrol the city, and to furnish such assistance as the chief of police might from time to time require. Following a general plan of ward organization adopted at a meeting of the Executive Committee, the city was divided into twelve ward districts, company organizations were effected, halls and rendezvous were selected and opened, clubs and arms were supplied under proper requisitions, and telegraphic communication was established and maintained with the ward headquarters and the chief's office; wagons, couriers, and rations were supplied, and on Wednesday night, as shown by our records and despatches, an average active force of 1500 members was on duty in outside patrol, or awaiting, as reserves, the call of the chief of police at the headquarters, while under this effective organization a total available force of 5438 members could have been rallied in an hour by general alarm.

On Thursday, Friday, and Saturday nights a feeling of fear was general in the city. Much of the information was received through the chief of police, and as such reports of disorder were communicated to me or my adjutant, we either sent telegraphic orders to ward commanders to act, or despatched strong bodies of men from the main hall to the scene of action.

The first danger feared was fire; and the second, the gathering of excited crowds which might be arrayed against the police at any moment. It was clear that general excitement pervaded all classes, and the most careful officials and prominent citizens made frequent reports to me of alarming occurrences or suspicious matters during these three days. From the fact that the criminal classes were in motion, that secret meetings were held, that political agitation was attempted, and that many alarms of fire were sounded, together with the continual calls of the chief of police for detachments—from all these I am assured that the good work of the committee checked the vio-

lent classes and showed them the potency of a large force ready to quell any disorder. In our prohibitive capacity the patrols of the committee prevented lawless gatherings, fire and tumult, especially in the more lonely portions of the town. The cavalry forces of the committee, numbering nearly three hundred men, patrolled on Thursday and Friday nights the manufacturing portion of the city and the outskirts. The immense value of exposed shipping and property along the city front naturally suggested precautions against fire, especially as many threats had been made to burn the Pacific Mail wharves; and Captain Stewart Menzies generously offered to cruise along the city front with his steam yacht *Elaine* and two smaller craft. Crews of special police and committeemen on board these vessels rendered valuable service.

On Friday night we supported the police in the largest and severest engagement of the campaign. We were informed of the enemy's movements, including a proposed attack on our headquarters and barracks. The main attack was designed against the Pacific Mail Steamship Company's properties, because of its connection with the Chinese immigration. It began by firing the large lumber-yards and surrounding combustible material. The attacking force was large. The firemen and fire brigade were soon in action with all the available police; our forces numbering seven hundred men, arrived soon after, on a double-quick in good order. The engagement became general and was stubbornly contested for about two hours, at the end of which time the united forces had routed the rioters in every quarter. Our men displayed coolness, discipline, and courage throughout. Our success was complete, and by midnight the city was quiet and safe. The next day showed the general demoralization and discouragement of the lawless element; they were subdued, and the backbone of their movement was broken.

On Saturday, the 28th, we withdrew all our forces from active duty, and by mutual arrangement General McComb took charge of and policed the city with the National Guard. Only slight disturbances occurred during the day, and the night passed quietly. Sunday proved peaceful and restful, a great boon to our citizens. The storm had passed and the calm was reassuring. The chief of police advised me that he was satisfied he could then take care of the city.

Within five days from the first call we had organized, armed, gone through successful action, completed our undertaking, established peace, order, and security; and, as the signs of the dangers which had called us out were now passed, we resolved that the returning quiet

should see us relinquish our extraordinary powers and public position. The committee determined to adjourn, but not to disband. The executive commander issued a general order.

The retirement of this large force was accomplished as speedily and as quietly as its organization. The headquarters only were retained, and all members advised to be ready to respond to call by messenger or tap of bell. As to our membership the result proved that the Executive Committee, their officers, and the great mass of men enrolled were moved by an unselfish devotion to public duty, and faithfully and intelligently wrought out the problem we had to solve. Their services were entirely voluntary, a generous offering, without a penny's pay or other moneyed compensation. They deemed it their high privilege and their imperative duty as Americans to give promptly their physical, moral, and financial aid as tributes for the maintenance of peace and good order; and all this being assured, they returned quietly to their families and their business.

In the history of California since it became American territory, the Vigilance Committees of 1851 and 1856 and the Safety Committee of 1877 are very important moral movements.

The Vigilance Committee was a new departure in the jurisprudence of the world. It may be called a compromise between the regular course of law, and the action of the people without regard to officers of the law. It was seizing upon the forces of a mob, arresting them in their mad course, harnessing them quietly, and utilizing their powers in regular form, systematically, coolly, and deliberately. It was a demonstration that had never before been made, and it was left to California to make it—while the law was lying dormant on the one hand, and trampled down and disgraced on the other, the people—the power of all government in our system—determined to execute in legal form what their servants had neglected or ignored. While they loved and revered the law, respected, upheld, and applauded its faithful servants, they contemned the faltering, and scorned the false and faithless administrators. In 1851 it cleared the country of Sydney ex-convicts and all the worst elements of the criminal classes. In 1856 it saved San Francisco from the rule of a mob of political outcasts, ballot-box stuffers, and a recent immigration of other criminals. In 1877, in the same place, the same people under different conditions, and yet in some regards similar, finding danger from much the same elements, but on a more formidable scale, determined to act under the law. The State government was in better hands than in 1851 and 1856; the city government was in

better hands; the country generally was in better condition. The influence of the Vigilance Committee of 1856 had continued and prevailed all the time. The ethics of the State were of a higher order than at the earlier date. The early experiences were valuable to individuals as well as to the masses, and when called up for self-government the people again demonstrated a capacity that has few parallels.

The men acting in 1877 believed and still believe, and acted with confidence on the proposition, that of all people in the world Americans are best fitted for self-government; that of all portions of the United States, California was the best fitted: first, because of the general character of the people that constituted the State from 1848; next, because of the value of the experiences of those people, coming from every State of the Union and from every foreign country, and developing here independence of action and thought. Moved always, as much as people can be in ordinary conditions of life, by a spirit of patriotism, unselfishness, and general intelligence, they harmonized and formed a composition of character and citizenship remarkable for breadth and strength. Unhampered by old local influences and free to act on their own judgment, they had the courage to carry out whatever they conceived to be right. This action has been appreciated, not only in California, but in other parts of the world where it has gradually worked its way from doubt and dislike to cheerful acceptance.

The agitation and disturbances of 1877, beginning outside of the State and afterward reaching San Francisco, begot the Safety Committee, the younger sister of the Vigilance Committees, in whose name and under whose banner the people of California sprang at once to the support of the government in the maintenance of peace and the punishment of crime with a promptness, decision, intelligence, and cool determination rarely equaled and never excelled. The citizens gladly accepted the opportunities to avoid independent action, such as had been previously forced upon them, and enrolled themselves as State troops and as city forces in the regular way; that is, they would be volunteers for a short campaign, sub-militia, or special police, under the regular authorities.

The people of the world know little of this movement, and even in California many have not held this matter in the esteem to which it is entitled. The late difficulties in New Orleans exemplified and illustrated, however, the estimation in which these works of the Vigilance Committees and the Safety Committee are really held by the country at large, because these organizations held the power of peace in their hands: the first without the continuous ap-

proval and in opposition to the State and city governments, the second entirely in harmony with them. All showed to the world that the same people have done much the same work — stepped forward and restored and maintained order, and then retired without claiming anything and without wanting anything, except peace and its good results. It was seen that these efforts left no political shock, no moral damage, and practically no legal difficulties; that they did not demoralize the communities; that so far from rousing a spirit of mobocracy they have in California obliterated mobocracy and mobocratic feeling. The mob in San Francisco has not been known in thirty years, except the effort in 1877, which was stifled in the beginning. The people of California are ready and prepared to organize and form military forces, if necessary, to meet a mob and crush it, and if the civil authorities are not sufficiently active, they will furnish the power to supply their place.

Referring to the recent lynching at New Orleans, there surely was ample cause for prompt and severe action, but the mode adopted was frightfully at fault. Californians must forgive it, tacitly pass it by, but it is with regret and not with approval. Under the same influences and circumstances, the people in California would have met as they did in New Orleans, under the impulse that moved them; but they would have organized in full force, and in military form if necessary; they would have taken quarters, formed a court, appointed a judge, and selected a jury of good men; called for evidence in the case that had been before the recreant tribunals, analyzed it carefully, put on trial the people who had been discharged by the perjured jury, given the accused good counsel, the benefit of all doubts that occurred; and finally, with deliberation and in regular form, would have executed those whom they found guilty. Those entitled to the least doubt would have been discharged. Had it required 5000 men in this organization, or 20,000, they would have been found ready for the work. For execution, Californian forms would have been carried out. The criminals would have been allowed time to arrange their worldly affairs, and the benefit of clergy. The execution would have been carried out with gravity, deliberation, and firmness, securing thereby a moral as well as a legal triumph, which is all lost by the wild, stormy, heedless action of a mob. The rule of the leaders of the California Vigilance Committees was that it was better for a thousand guilty men to escape than that one innocent man should suffer.

It is to be feared that even the qualified approval of the New Orleans affair may encourage hasty people in other quarters and in other

cases to adopt the modes of the New Orleans incident; whereas the California fashion has the great advantage of giving time for reflection and examination. A man in the heat of passion does many things that in cooler moments of the next day he would gladly change. None of the California executions, except that of Jenkins, was made within four days after arraignment. Every one who had a right to say anything was given an opportunity to do so; time was given for close inspection of testimony as to all pleas of justification and all equities. The New Orleans episode was a demonstration that could be made by any rude party, but the work of the California Vigilance Committees could only have been done by men who could govern themselves as well as others — men determined to do right and to admit of nothing but the right.

God forbid we should hereafter need vigilance or safety committees. The people of California do not want them. Those who organized and conducted these efforts heretofore as fully appreciate the undesirability of all such proceedings as any one else can, and they would never appeal to them nor encourage an appeal to them except as a last resort in dire necessity. If the delegated officers of law do their duty, neither will be needed, and mobs will be known in history only. But so long as our system is, as now, cursed with the harassing delays of law, new trials, endless technical appeals, shameless and unproved perjury, and daily defeats of justice, hope is liable to lapse into despair, and serious danger to follow. The extent of these dangers no one can measure. The agencies employed, the people brought into action, the circumstances surrounding them, may produce results far less satisfactory than those that fell to the lot of the people of California.

The safety of person and property in California, young as the State is, covering a large area of territory, and sparsely populated, furnishes a record that is hardly to be found elsewhere. The greatest satisfaction, however, given to Californians was that they had thus disproved the assertion often made that the Vigilance Committee was mobocratic and that Californians necessarily acted in an extra-judicial manner. The State authorities by their course in 1877 really adopted and approved the work of 1856. They gladly embraced the opportunity to bring the same people and the same influences to work under the laws of the State. This shows to other countries that with proper regulation and proper encouragement the citizens of New Orleans or other communities may be relied upon to maintain peace and good order, if the State authorities have the breadth and good judgment to incorporate the people as active aids in great crises instead of

doubting them and trying to do without them. The grand result of such a policy is that every good citizen may consider himself a part of the practical workings of the machinery of the State; he may be at his bench, his plow,

or his desk, ready to stop and turn his hand to the service of the State, if only for a day. I regard this as one of the great strongholds of self-government, a source of incalculable strength to Americans.

William T. Coleman.

[In an early number of *THE CENTURY* will appear a series of letters by General W. T. Sherman, written from San Francisco in 1856, and setting forth his relations to the committee of that year and his reasons for opposing its work.—EDITOR.]

SEAL OF THE VIGILANCE COMMITTEE.

TOPICS OF THE TIME.

Lowell's Legacy to his Country.

IT is Man who is sacred, it is his duties and opportunities, not his rights, that nowadays need reinforcement. It is honor, justice, culture, that make liberty invaluable, else worse than worthless, if it mean only freedom to be base and brutal.

THESE golden words, taken from the letter of Lowell now first printed in another column of *THE CENTURY*, are as level to the needs and the duty of this very hour as they were to those of the moment when they left the poet's pen. This whole letter was written in pain and indignation—the pain of the true patriot, the indignation of the just and far-seeing citizen. It is written with the same fire that inspired the "Biglow Papers" on the one hand and the "Commemoration Ode" on the other. Looking back through all the praise that fills the air above the grave of the poet, it seems amazing that he could have been once so misunderstood and maligned for actions consistent with his entire career,—actions which only proved anew the wise and unfailing patriotism of the man,—a patriotism which is one of the principal causes of his fame, as it is the chief reason for the love in which he is held by his countrymen.

Lowell's legacy as a poet is great, but not greater than his legacy as a patriot. The true patriot does not love his country, labor and suffer for it, simply because he happened to be born in it,—that would be the infatuation of the egotist; but because, *being* born in it, his duty and pleasure are to help on all human progress by helping on first the progress of the land to which he belongs. This is Lowell's legacy as a patriot,—not the sentiment "My country, right or wrong," but "My country—it shall never be wrong if I can help it!" The true patriot is not the one who says it is *my* country, and *its* institutions, that are sacred; but who says, with Lowell, "It is Man who is sacred." The citizen who holds to this sacredness of humanity will be the most useful in securing institutions and a country whose services to humanity will make *them* also sacred in his own heart, and in the hearts of all good men.

Michigan's "Wild-cat" Banks.

THE history of Michigan's "wild-cat" banking experience, while not so applicable to present financial discussion as other cheap-money experiments which we have cited in previous numbers of *THE CENTURY*, is nevertheless instructive for two reasons: first, because it was an attempt to make "hard times" easier by unlimited issues of irredeemable paper money, and second, because the money so issued was based largely on land as security. For these reasons it has seemed to us worth while to recall it at the present time.

Michigan became a State in January, 1837. Almost the first act of her State legislature was the passage of a general banking law under which any ten or more freeholders of any county might organize themselves into a corporation for the transaction of banking business. Of the nominal capital of a bank only ten per cent. in specie was required to be paid when subscriptions to the stock were made, and twenty per cent. additional in specie when the bank began business. For the further security of the notes which were to be issued as currency, the stockholders were to give first mortgages upon real estate, to be estimated at its cash value by at least three county officers, the mortgages to be filed with the auditor-general of the State. A bank commissioner was appointed to superintend the organization of the banks, and to attest the legality of their proceedings to the auditor-general, who, upon receiving such attestation, was to deliver to the banks circulating notes amounting to two and a half times the capital certified to as having been paid in.

This law was passed in obedience to a popular cry that the banking business had become an "odious monopoly" that ought to be broken up. Its design was to "introduce free competition into what was considered a profitable branch of business heretofore monopolized by a few favored corporations." Anybody was to be given fair opportunities for entering the business on equal terms with everybody else. The act

was passed in March, 1837, and the legislature adjourned till November 9 following. Before the latter date arrived, in fact before any banks had been organized under the law, a financial panic seized the whole country. An era of wild speculation reached a climax, the banks in all the principal cities of the country suspended specie payments, and State legislatures were called together to devise remedies to meet the situation. That of Michigan was convened in special session in June, and its remedy for the case of Michigan was to leave the general banking law in force and to add to it full authority for banks organized under it to begin the business of issuing bills in a state of suspension,—that is, to flood the State with an irredeemable currency, based upon thirty per cent. of specie and seventy per cent. of land mortgage bonds. The law was so modified that any number of persons, upon signing an agreement to that effect, might become a banking corporation, and almost any one might become a director.

Everybody in the State who was in debt, and everybody who saw in the law an opportunity for rascality, went into the banking business. Within a few months wherever two roads crossed a bank was established. One was found in a saw-mill, and one of the official records of the period says: "Every village plot with a house, or even without a house, if it had a hollow stump to serve as a vault, was the site of a bank." Many of them had no offices, no books, and no capital. Judge T. M. Cooley, in an interesting account of the experience in his history of Michigan, published in the "American Commonwealths" series, says (p. 267): "Wild lands that had been recently bought of the government at one dollar and twenty-five cents an acre were now valued at ten or twenty times that amount, and lots in villages that still existed only on paper had a worth for banking purposes only limited by the conscience of the officer who was to take the securities."

As for the requirements for ten per cent. payment in specie at the time of subscription, and twenty per cent. before beginning banking business, these were soon got around in ways more unscrupulous than ingenious. As the payments were to be made to the banks themselves, the same specie could be used many times over. Sometimes a small sum in specie was paid in and taken out, and the process repeated over and over, till the amount required was made to appear as having been received. Sometimes specie certificates, stating that the maker held a sum of specie for the bank, were counted as specie. These were almost invariably false, and they were made to do service for many banks in succession. If specie was actually used, as soon as the bank examiner had seen it it was hurried into a wagon and taken with fleet horses to another bank where it again did duty as capital. "Gold and silver," say the official chroniclers, "flew about the country like magic; its sound was heard in the depths of the forest, yet, like the wind, one knew not whence it came or whither it was going." Sometimes what seemed to the eye of the examiner to be kegs of specie were really kegs of nails or window-glass with a thin layer of coin on top. The loan of specie to be used in the establishing of banks became a regular and lucrative branch of banking business.

Within one year forty-nine banks were organized, and forty went into operation with a professed capital

of \$1,745,000, of which thirty per cent. was claimed to have been paid in in specie. Over \$2,000,000 of irredeemable paper was distributed throughout the State, of which probably not a dollar was based upon *bona fide* capital paid in for legitimate banking purposes. As was inevitable, there was no public confidence in money of this character. Whoever received it got rid of it as soon as possible. It was always at a great discount with the money of eastern banks, and some of it was rated much higher than the rest. Much of it was never circulated near the places of issue, which were selected often in spots as inaccessible as possible, in order that the bills might not soon return to plague their sponsors. Adventurers from New York and other distant places went into the wilds of the State, located banks, took the entire issue of money, and put it in circulation anywhere but near the place of issue.

The commissioners used all possible vigilance to close up bogus banks, but as fast as they closed them others were started. When a "wild-cat" bank either failed or was put in the hands of a receiver the farmers and laboring people suffered the most severely, as is always the case in such disasters. The plague ran its course in about a year and a half. At the end of 1839 there were no fewer than forty-two "wild-cat" banks in the hands of receivers, and only four still doing business. Nearly all the currency of the State was worthless, business was prostrate, values of all kinds had been nearly or quite destroyed. There was no buying or selling of land, and only the bare necessities of life were able to command a market. The banking law was taken before the courts and declared unconstitutional, and the system was abolished, leaving behind it no assets, but boundless ruin.

In summing up the results, Judge Cooley, in language which many modern advocates of cheap money may peruse with profit, says: "Such were the fruits of the experiment of giving equal and practically unlimited rights in banking to everybody who wanted a shorter road to wealth than that trodden by labor and honest industry. The new State, under the bold but inexperienced guidance of its youthful governor, disdaining the lessons of history, had determined to try for itself the experiment of manufacturing money by the printing-press. The condition after the experiment might be compared to a forest after a cyclone; everything was prostrate, and everything was in confusion! . . . Thereafter wild-cat banking was a byword in the State; but the lessons it taught needed to be learned at some time, and were not likely to be learned except with experience as a teacher. One of its lessons was that neither real estate nor anything else not immediately convertible into money can support the credit of bank currency." This lesson is as applicable to the whole country as it was to Michigan, for even the United States Government is not powerful enough to support the credit of bank currency in real estate or anything else not immediately convertible into money. This is, moreover, the lesson of all human experience.

Corrupt Practices Legislation in 1891.

ATTEMPTS were made in several States during the present year to have laws passed limiting campaign and election expenditures, and requiring sworn publication of the same by candidates and committees, but

Michigan alone succeeded in having such a law enacted. In New York a bill amending the present law, extending its requirements to campaign committees and their officers, passed the Senate and failed in the Assembly. In Massachusetts an excellent bill passed the lower house and failed in the Senate. This is the third successive year in which a measure of the kind has met precisely that fate. In Minnesota a different but equally excellent bill passed the Senate and failed in the house. A bill forbidding both the contribution and use of money for illegitimate purposes in elections passed one house of the Rhode Island Legislature.

The Michigan law, which is simply a part of the State's new and excellent Ballot Reform Law, forbids all candidates to "treat," or in any way furnish entertainment to voters, or to spend money to procure the attendance of voters at the polls, or to contribute money for any except legitimate expenses of the campaign, and requires sworn publication after election, by candidates and committees, of all moneys expended. The law is similar to the New York law, but goes a most important step farther than that has gone, by requiring sworn publication of expenditures by committees as well as by candidates. The failure of the New York law to include publication by committees has proved in practice to be a serious bar to its efficacy, as we predicted it would last year. (*THE CENTURY* for July, p. 475.) Candidates are able to evade it by merely stating in their sworn returns the lump sums which they hand to the committees for expenditure. As no accounting for the use made of this money can be obtained from the committees, it can all be used for corrupt purposes with slight chance of detection and punishment. The persistent refusal of the politicians—the amendment has been defeated in two successive legislatures—to allow committees to be included is the strongest possible testimony to the efficacy of the desired extension.

The law proposed for Massachusetts this year, by the able and indefatigable group of reformers who have done so much to give that State its preëminence in all questions of electoral reform, was a distinct departure from the two measures which preceded it to defeat in 1889 and 1890, and was in many respects an original measure among laws upon this subject. Its provisions are worthy of study by all students of the question. They required that committees and organizations of any kind assisting in the nomination, election, or defeat of any candidate for political office should have treasurers, and should cause to be kept detailed accounts of all moneys, securities, and equivalents of money received or promised to them, and of the manner in which the same had been expended, and of all payments, liabilities, or promises of payment made by them. Within four weeks after election all treasurers were required to file sworn statements of all transactions in which they had been engaged during the campaign, giving itemized accounts of all receipts, and of all disbursements. Every member of a committee or organization who received or disbursed money or its equivalent in any form was required to make a detailed statement to the treasurer, who must include it in his sworn return. Every candidate before any caucus or convention, or at any election, was also required to file a sworn statement in detail of all receipts and disbursements of which he had personal knowledge. Every payment of a sum exceeding five dollars to any one person for expense in election

must be vouched for by a bill stating particulars and by a receipt.

The bill did not imitate the English Corrupt Practices Act by fixing maximum limits to expenditures. It did, however, provide specifically for blank forms which must be filled out in the sworn returns, and which required the setting down of the exact amounts used for printing, hall and headquarters rentals, stationery, clerk hire, canvassers, and other familiar campaign expenditures. The entirely original feature of the bill was its bestowal upon the Supreme Judicial Court and the Superior Court of full equity powers to compel any person who should fail to file a sworn statement which did not conform strictly to the law to file one which did so conform. These equity proceedings might be begun on petition of any candidate voted for in the election, or on the petition of the qualified voters in the election. The courts were empowered to advance such cases upon their dockets in order that they might be decided with the least possible delay. No person testifying in such case was to be liable to criminal prosecution for anything concerning which he might testify, except for perjury.

The Minnesota bill was constructed on entirely different lines, and was notable as being the first American measure which was designed to prevent the undue use of money in elections by means similar to those embodied in the entirely successful English Corrupt Practices Act. It limited the expenditure of all candidates for the United States Senate, Congress, and State offices to \$1000 each; that of all candidates for county offices to \$500 each; that of all candidates for offices in cities of more than 15,000 inhabitants to \$500 each; and that of all candidates in all other places to \$250 each. It forbade the use of any of the money allowed by law for any save the legitimate expenses of election, and defined with great minuteness both lawful and unlawful uses, following in this respect the minuteness of the English statute. It forbade the use or the contribution of money by candidates, or anybody else, to influence the vote of any person; forbade betting of all kinds on the election, and bullying, intimidation, and violence, either by individuals or corporations, to influence the vote of any person; and required sworn statements in detail by candidates and committees, within ten days after election, of all sums received and expended. The violation of any provision of the act was made a misdemeanor, punishable with imprisonment for not less than three months nor more than a year, in addition to forfeiture of the office in case of election.

Both these measures are so stringent in their provisions that were they to become laws they could not fail to have a most salutary effect in driving out of our elections much of the corruption which has crept into them during the past quarter of a century. It is to be said of the Minnesota measure that it is not an experiment, for it is based upon the practical success of the English statute. When that was under consideration there was general skepticism in England about both its wisdom and its practicability, but it demonstrated both completely on its first trial. It was thought that the maximum limits of expenditure had been placed too low, but it has been found in practice that they were fully a third too high. At no election under the law has the total of actual expenditure exceeded two thirds of the amount permitted by the law. Sworn

publicity has been the chief agent in abolishing the corrupt and extravagant use of money, but another cause for the diminution of expenditure has been that the law permits only an equal outlay by all candidates, rich and poor alike. When one candidate could bribe and buy votes, his opponent had to bribe and buy to a greater extent to carry the day against him. Now, it being impossible to overmatch corruption with greater corruption, the elections are not only honest, but comparatively inexpensive.

What has been accomplished in England can be and will be accomplished here. The adoption of the secret official ballot is certain to help forward this reform, for it is a step in the same direction. That ballot has taken away the chief excuse for the contribution of large sums of money in elections, and has taken away also the possibility of keeping watch upon its use at the polls to see if the bribers keep their bad bargain. The next step will be to force the sworn publication of all expenditures, and we are confident that public opinion will bring this about within a very few years. The professional politicians, who get their living out of politics, will fight it desperately, for it is the death-blow to their trade. The secret ballot has taken away their chief occupation; this reform will take away their chief source of income, for a large part of the money which is contributed for campaign and election work goes into their pockets.

An American Achievement in Art.

It must be considered a fortunate omen for the future of American art that within the fifteen years which have passed since the Philadelphia Exposition we have confessedly taken the first rank among contemporary nations in two important branches of artistic work,—namely, in stained glass and in wood-engraving,—to what extent it is to be hoped the World's Columbian Exposition will adequately show. This is of course by no means the whole, or even a large part, of the development of art among us; in painting, in sculpture, in the decorative arts, and particularly in architecture, the progress has been both remarkable and, in the main, upon lines which indicate a widespread and genuine growth in taste and artistic education among our people. But it is quite within bounds to say that no department of artistic activity has yet produced a result of rarer and more permanent value than is shown in the series of wood-engravings which Mr. Cole has been making of the Italian Old Masters, and which from month to month we have been presenting in the pages of *THE CENTURY*. This is an achievement of which Americans may properly be proud—to have contributed to the work of multiplying in black-and-white the most famous masterpieces of Italy an engraver of such delicate sympathy and such exquisite skill as Mr. Cole.

With the present and the following numbers of *THE CENTURY* this series will reach the apex of pictorial art

and popular interest in the work of Michelangelo, Raphael, Del Sarto, Titian, and their contemporaries. At the beginning of this last year of Mr. Cole's memorable enterprise we may commend the series anew to all lovers and students of art, in the words of Mr. Charles Eliot Norton, Professor of Art in Harvard University, who, in 1889, wrote in "The Nation" concerning the earlier examples:

Nothing that has yet been done by the American engravers on wood who, during the last few years, have carried their art to the highest excellence in reproducing the characteristic qualities of the work which they have had to copy, has surpassed in exactness of delineation, in refinement and vigor of execution, and in sympathetic rendering of the subtlest features of the original, these remarkable productions of Mr. Cole. The variety of the technical methods of which he shows himself master has enabled him to reproduce with equal success work as widely different in motive and style as the mosaics of Ravenna and the panel paintings of the Florentine artists of the fourteenth century.

No engravings hitherto existing of the works of early Italian art give so much of the essential spirit as well as of the manner of painting of these works as this series of Mr. Cole's. It is therefore invaluable to the student or the lover of the art of a period when the poetic genius of Italy was inspired with the first flush of conscious power, and was endeavoring to express itself in forms of beauty which it was not yet able completely to realize, but which, in their very simplicity and imperfection, often possess a charm beyond that of the more complete performances of a later and more sophisticated age.

Mr. Cole's skill is so masterly, and his artistic sympathies are so broad, that there is no doubt that he will reproduce the work of the painters of the fifteenth and sixteenth centuries not less admirably than he is doing that of their forerunners.

It will be a surprise to our readers to learn that work which can elicit such authoritative commendation, and which belongs to a class of art that has made America famous abroad, is nevertheless officially and deliberately excluded by the United States Government from the category of art. To the Treasury Department Mr. Cole's blocks are merely "manufactures of wood," and as such are heavily taxable at the Custom House, while the merest daub of the youngest tyro of an art student may come in free of duty as the "work of an American artist done abroad." It is to be hoped that with the abolition of the tariff on art—a tariff levied to protect artists who cry out against being protected, and maintained on the ridiculous assumption that art is a luxury—some way will be found to bring the decision of the Treasury officials as to the status of wood-engraving into harmony with the intelligent judgment of the entire art world, which, whether tested by the conferment of honors at the Paris Exposition or the French Salon, or by the recognition of wood-engravers as associates of the British Royal Academy, or by the exhibition of wood-engraving in the art sections of every museum of note, or, in brief, by the opinion of artists, critics, and connoisseurs, is unanimous in recognizing wood-engraving as an artistic medium, and its products as among the artistic glories of our day.

OPEN LETTERS.

Notes on Michelangelo.

I REMEMBER a picture by Gérôme that represents Raphael in his first visit to the Sistine Chapel—that stolen visit recorded by Vasari, and in which Raphael is shown to be shrinking to the ground as he steals along with his head raised to the stupendous creations above him. Something of this feeling of shrinking always comes over me when I go into the Sistine Chapel. I have been much impressed, while engraving the “Cumæan Sibyl,” with the incessant movement of Michelangelo. It is endless, but most subtle. All is form with him—grandeur of form. Yet he has grand repose—the repose of the ocean, never at rest. If he should give way to the terrible within him! *But he is always contained*, and they are, to my thinking, mistaken in him who say he always “lets himself out.” Where is there any such excess about him? It would be the height of all absurdity and weakness, found no doubt among his followers, with whom let those compare him who think he is “all blow,” and they may then perhaps see or feel the profound depth and grandeur and forbearance he is possessed of, and the terrible inward power he suggests. Note the marvelous finish of his things, even to the minutest portions. His flesh is so highly finished that you feel its softness, and when he sets his hand to finish, he slights nothing, and it is amazing what delicacy he can give. He paints the twisted thread in his “Three Fates” with the utmost fidelity; you note its twisted character throughout, and the light upon it, relieving it from the drapery here and there, and then the bunch of flax in its sheaf, most remarkable for lightness and delicacy of touch. I could not reproduce, should I engrave never so fine, the amazing quantity of work he puts in, and the finish and delicacy he gives to everything.

Michelangelo's coloring is not what is generally known as rich, but it is perfection in the harmony and softness of tints. The frescos of the Vatican have darkened from dampness and the smoke of incense, but it is easy to see that they must have been light in coloring—painted in a very high key. The highest lights even now approach pure white, while the darkest portions are gray and soft. The scheme of coloring in the whole is very refined; nothing is pronounced or positive. The tints are laid in broadly, and float tenderly into one another. The backgrounds to the figures and the skies are gray, the lightest portions nearly pure white, while the coloring of the robes is sometimes blue of a fresh, pure, delicate tint, red of a fine, soft grayish tone, yellow inclining to old gold, and green of a most delicate soft gray tone; and then there are mixtures of these tones of fine subtle hues impossible to describe, but darkish and gray in tone. His flesh tints are finely worked, of a darkish warm gray tone. It is a grandeur and depth of coloring quite befitting the nobleness of the theme and execution.

I did not engrave the cracks in the “Cumæan,” as I did in the “Delphica.” You don't see them, or are not attracted by them; as you look up at the frescos.

T. Cole.

California's Interest in Yosemite Reform.

THAT the errors which have brought the management of the Yosemite Valley into disrepute should be excused, or even applauded, by an odd person or newspaper here and there in California, is in line with what was to be expected by those who have sought to effect an alteration of the policy which has had such regrettable results in almost every department of the control of the Valley. There is no cause so bad or so ridiculous that it may not procure encouragement from people of excellent conduct in their every-day affairs, but who are by nature or by lack of training incapable of discrimination in special concerns, or who, in dealing with public interests, allow personal sympathies or narrow local prejudices to hustle their better judgment unceremoniously out of doors. Were the good citizens of San Francisco to awake some morning to discover that their beautiful Golden Gate Park had been villainously desecrated during the night—that, for example, some of its fairest parts had been parceled off into potato patches or cattle corrals; that other extensive tracts had been withdrawn from public enjoyment and were occupied as hay-fields or pastures for hack-horses; that fine trees and shrubbery, so laboriously and expensively established, had been ignorantly hacked or burned; that, in short, the whole place had been turned over to the mercies of a management devoid of proper perception of what is attractive and lovely in landscape effects—then assuredly would be heard a great tumult of indignation. At the same time there would doubtless be audible some small percentage of voices wondering why there should be so much ado about nothing, or professing hearty admiration for the practical common sense under whose guidance the transformation had been evolved.

It would be a dim discernment that could make question as to which of these opposing sentiments would finally prevail. So also, despite the childish pamphleteering and the unnecessarily vehement protests of the Yosemite Commissioners and their limited circle of apologists, no occasion has arisen, or is likely to arise, to doubt that the endeavor which is in progress to secure a reformation in the management of the Valley is regarded otherwise than with approval by all Californians not directly, or indirectly, under the sway of the influences which have been mainly responsible for the injurious courses that are the objects of complaint. To credit the people of California with any other opinion would indeed be to impeach their intelligent loyalty to their State. It is obvious that the honor and the interest of California, so far as they are at all affected thereby, are to be served much more efficiently by working out an improvement in the handling of so conspicuous a subject as the Yosemite Valley than by refusing to see, or denying the existence of, destructive tendencies which are most palpably in evidence. The press of the State has not been slow to recognize so reasonable a proposition. It has, in fact, contained many utterances certainly no less condemnatory of the Yosemite management than those which have found expression elsewhere.

Other indications of the sentiment of California were

observable during last winter's session of the legislature. A committee of that body, having to report on the advisability of abolishing the Yosemite Commission, explained in effect that they were not prepared to accept the responsibility of recommending such abolition, simply because the act of Congress which intrusted the Yosemite to California had prescribed the form of government as composed at present. To abolish the Commission before preparing to replace it by some other system of management would be to leave the premises without any ruling authority. Such a report was, of course, equivalent to an announcement that but for the obstacle presented by the act of Congress the committee would have recommended the abolition of the Commission as useless or something worse. It was noticeable, too, that while the Yosemite Commissioners had asked for the sum of \$50,000 to cover their expenses during the present year and the next, the legislature appropriated no more than \$15,000. That in this large reduction of the estimate there was no suggestion of close-handedness is proved by the appropriation later in the session of a sum of \$50,000 (afterward vetoed by the Governor) to pay for building a public highway to the Valley, and so to relieve travelers from the onerous demands of the system of private toll-roads by which the great resort is now reached. It is well understood in California that the controlling element of the Commission has been opposed to the establishment of a free public road, as such an institution would be contrary to the interests of the transportation companies doing business in connection with the Valley. The rejection of the Commission's estimate of expenditure, the appropriation of \$50,000 for a purpose not supported by that body, and the unavoidable interpretation to be given to the legislative committee's report concerning the abolition of the Board of Commissioners, are all instructive indices to the disfavor with which the management is regarded by the mass of Californians themselves.

The time would appear to be ripe for the formulation of a distinct scheme for an improved method of direction of the Valley. The longer a reformation is delayed the greater will become the hindrances to its operation and the more irreparable will be the consequences of inappreciative and unskilful management. It must be borne in mind that the present Commission has publicly announced its intention to cut down all the trees which have sprouted in the Valley within thirty years—a policy which Mr. Frederick Law Olmsted, the expert professional landscape architect, states would prove in execution "a calamity to the civilized world." An immense amount of damage may be wrought even with the reduced appropriation which the legislature felt compelled to concede in order to provide for the maintenance of existing roads, trails, and other necessary conveniences. The unwise expenditure of a few hundred dollars may destroy attractions that could be replaced, if at all, by no outlay of money, but only by the indefinitely prolonged lapse of time. Already—and while the Commissioners have been denying that the floor of the Valley has been injured by the official management—an insignificant sum in dollars has proved adequate to degrade the wild natural charm of Mirror Lake into the condition of a mere artificial irrigation reservoir, and the cheap and debasing "improvements" on exhibition at that once romantic tarn have their coun-

terparts in a long panorama of allied barbarities. To the end that such encroachments on the perfection of Yosemite may not become ineradicable, and on a continually spreading scale, procrastination in transferring the management to hands of the highest expertness will be one of those blunders that fall little short of constituting a crime.

Perhaps the readiest and most effective method of securing a reform would be found through the absorption of the district covered by the grant to California in the great National Park—a reservation as large as the State of Rhode Island—recently established by act of Congress, and which entirely surrounds the Valley, extending away for many miles on every side. Such an absorption would go far to hasten the arrangement of a thorough system of park control not yet advanced beyond the stage of a preliminary makeshift. The proposed absorption has been widely commended throughout California, the generality of whose people are endowed with sufficient acumen of mind not to be deceived by appeals to the contrary—appeals based on perverted notions of State pride, and instigated by purely selfish motives of personal vanity or pecuniary advantage. Californians are justly proud of their State, and are not likely to be satisfied with less than the best expert care of their wonderful scenic treasures. One can find an upland farm anywhere. The glory of Yosemite consists largely in its wildness, and this characteristic can be preserved only by intelligence and skill of the highest order.

George G. Mackenzie.

The Paris Opera.

THE French National Academy of Music was founded in the year 1669, during the reign of Louis XIV. Before being transferred to the splendid edifice erected by M. Charles Garnier, the opera was located in various parts of Paris—in the Rue de Valois at one time, on the Place Royale at another, and again in the Rue Le Peletier. Between its foundation and the year 1672 the opera only performed unimportant works, such as ballets. The first lyric work it presented was an opera-ballet by Lulli, entitled "The Fêtes of Cupid and Bacchus." For a century after 1672 a considerable number of operatic works by French and Italian composers of every kind and without any distinct characteristic were performed at the opera, and it was only when Gluck's "Iphigénie en Aulide" was produced in 1774 that dramatic music acquired a special form in France.

M. Arthur Pougin, a French writer well known as an authority on music, has written an admirable monograph on Gluck, who may be styled the founder of French music. His "Orphée" was produced at Paris in 1774, "Alceste" in 1776, "Armide" in 1777, and "Iphigénie en Tauride" in 1779. M. Pougin has justly said that the rôle played by Gluck in the revolution of French dramatic music was so preponderant that he originated a school of music which abandoned and destroyed the former repertoire of the opera. Gluck's genius was so powerful and so innovative that he overturned all musical theories which had preceded him. The only opposition he encountered was from the partisans of an Italian composer named Piccini, whose "Roland" was performed at the opera in 1778

and originated a famous divergence of opinions among composers known to the musical world as the war of the Gluckists and Piccinnists. The two most important composers of the Gluck school are Cherubini, born at Florence in 1760, and Spontini, whose "Vestale" and "Fernand Cortez" enjoyed great success at the opera. Among modern composers whose works have been performed at the French National Academy of Music the most popular are, Hérold, Auber, Halévy, Rossini, Meyerbeer, Donizetti, Verdi, Ambroise Thomas, the present director of the Conservatoire, Gounod, Saint-Saëns, and Massenet.

The Opera House is the property of the State, which appoints the manager for a renewable term of seven years, and pays him, after a vote in the Chamber of Deputies, an annual subvention of eight hundred thousand francs (one hundred and sixty thousand dollars). The director or manager is bound to give a fixed number of performances, to keep the opera open during the whole year, and to produce a certain number of new works, which are mentioned in his contract. The manager is amenable to the Minister of Fine Arts and Public Instruction in case of non-fulfilment of his contract. It is only reasonable that the Minister of Fine Arts, who has charge of the national museums and art galleries, the subventioned theaters, and other public buildings, should possess unlimited control over the financial management and the working of the department for which he is responsible to the nation, but in order to regulate the details of art he needs to be at one and the same time an artist, a sculptor, a musician, an author, and a tragedian, as well as a politician, which is practically impossible.

In the contract signed by the manager of the opera the Minister decides not only the number of performances and of new works, but also the number of sopranos, tenors, baritones, basses, choristers, musicians, ballet-dancers, etc. who shall be employed at the opera. In fact he regulates the entire management of the opera in every detail. But there are many artistic questions which arise in the working of a lyric stage that can only be solved by an enlightened and intelligent musical director, and not by a mere stage-manager, however competent he may be in his department.

Since the foundation of the opera there have been forty-eight managers and twenty-six leaders of the orchestra. Some of the latter have resigned the position at the end of a year; M. Lamoureux resigned it at the end of two years; I myself have occupied it for four years.

The musical rehearsals at the opera are conducted on a system unknown to any other theaters in the world, be they Italian, German, English, Russian, American, or Spanish. The chorus-singers are trained by a leader of the chorus, the singers are trained by accompanists known as singing-masters, who give their instructions to the leader of the orchestra. When the preparatory rehearsals are finished, the time-beater, who supports the whole responsibility in the eyes of the public, has only acted as a metronome, if he has the good fortune to score a success. It is evident that some reform is necessary in this division of authority for the good of musical art, and I heartily hope it may soon be accomplished.

The orchestra consists of ninety-four musicians, all of whom are performers of great merit and some of

great celebrity, such as M. Taffanel, the flutist, who is often engaged to perform at Prague, Dresden, St. Petersburg, and Moscow by the Philharmonic societies of those cities; M. Turban, the clarinetist; Messrs. Berthelier, Loeb, and Laforge, the well-known violoncellists. All the musicians of the opera are members of the orchestras of the Conservatoire, Lamoureux, and Colonne concerts. Their salaries at the opera vary from \$140 to \$600 per annum. For this amount they have to play at 192 performances, and at all the rehearsals which may be necessary, and which are unlimited.

While speaking of the orchestra of the opera I am glad to have an opportunity of replying to certain attacks which have been made upon it by M. Robert de Bonnières in the *Paris "Figaro"* of April 19, 1891, and by a New York journal which accuses the orchestra of decay. The following letter, addressed to me by Franz Liszt, proves that, far from decaying, the orchestra is more powerful than ever.

DEAR M. VIANESI: I wish to renew my thanks and praises to you personally. On the matter of your intelligent and firm conducting of my "Legend of St. Elizabeth" at the Trocadéro, the composers who were present agreed with the public that the results achieved by you and your executants were splendid, spite of the difficulties which the work presents from the frequent changes of rhythm and tone.

FRANZ LISZT.

After the performance of "Ascanio" Camille Saint-Saëns wrote me as follows:

The musicians of the orchestra have added to the instrumentation of "Ascanio" what a great singer adds to a melody — *i. e.*, color and life. If musicians play better anywhere else it can only be in the other world. As for yourself, whose burden in my absence was most heavy, you rose to the height of the situation. You possess the precious quality of not conducting like a metronome, and give to my music the suppleness which is essential to an artistic orchestra.

CAMILLE SAINT-SAËNS.

The real defect in the orchestra has been pointed out by M. Robert de Bonnières, who says:

The leader of the orchestra, whose word should be law, like that of Hans Richter at Vienna, that of Hermann Levi at Munich, and that of Mottl at Karlsruhe, is ignored at Paris. It matters little therefore who conducts, whether it be M. Vianesi, M. Altès, or M. Lamoureux. Whoever he be, the conductor leads without being permitted to direct those he leads, and is completely powerless. I need not dwell on the fact that he has to be the humble slave of the scene-setters, of the singing-masters, of the chief scene-shifter, of the singers, and even of the dancers: the difficulty of his position will be clearly seen when it is understood that he is required to hold his tongue at the risk of causing a scandal.

Therein lies the real evil, and if the present pernicious system be not speedily and radically reformed the organization of the opera will merit the title given it by a witty Parisian composer, who calls it "Louis XIV.'s musical box."

A. Vianesi,

Musical Director of the French National Academy of Music.

George H. Boughton.

GEORGE H. BOUGHTON was born in England in 1834, but was only three years old when his parents removed to Albany, New York. Here his earliest edu-

cation in art was gained, and though he went to London for a brief period in 1853, he returned here to live for six years, first in Albany and then in New York City. In 1859 he went to Paris, and in 1861 he established himself in London, which has remained his permanent home. Since the year 1858 he has frequently exhibited at the Academy of Design, and he was elected an Academician in 1871. But Mr. Boughton has also been honored by the British Royal Academy with the title of Associate, and despite the fact that he has often painted American themes, as in the very popular "Return of the *Mayflower*," his long residence abroad, his general choice of subject-matter, and especially the character of his painting, rank him rather as an English than as an American artist. Many of his pictures are, however, owned in this country, and while Mr. Boughton was for a time in New York during the autumn of 1890 some twenty-five of them were exhibited at the Union League Club. They included a few landscapes with small figures, some scenes from early life in New England and New Amsterdam, and a larger number of those thoroughly English pictures of pretty maids and children in old-time dress and with outdoor surroundings upon which, even more than upon his Puritan pictures, Mr. Boughton's popularity is based. It is a little difficult now to realize how greatly the English public was charmed by these last-named works when they first began to appear. They have been widely imitated since, in their semi-modern, semi-idyllic character, in their rather pale schemes of color and their flatish effect, imitated on other canvases, on Christmas cards, and in children's books, until Mr. Boughton may well have been reminded of Tennyson's rare flower which so scattered its seed abroad that it came to be called a weed.

Quite different from these in spirit, and, I think, much more vital and interesting, are Mr. Boughton's pictures of the class which is represented by the "Izaak Walton and the Milkmaids" engraved on another page of this magazine. Here we find more naturalness and vigor in the conception of the figures, and an attractive expression of that delicate sense of humor which, to me, seems Mr. Boughton's most enviable gift. Nor in any other of his works has he given us a more charming bit of English landscape than in the background of the "Izaak Walton." It is one of his comparatively recent works, was included in the Union League Club collection, and is owned by Mr. Charles Stewart Smith of New York.

M. G. Van Rensselaer.

A Roman Catholic's View of "Sister Dolorosa."

A REPLY TO MR. JAMES LANE ALLEN'S LETTER IN THE CENTURY FOR MAY.

"SISTER DOLOROSA" is a good example of what may result from superficial writing on the part of an author. Mr. Allen seems to be under a misapprehension in regard to the "religious life" and in ignorance of the rules and regulations which prevail in convents, but in his story there is no evidence anywhere of a want of respect for nuns, or of a wilful intention to misrepresent them, and for that reason he is entitled to courtesy from Catholics even while they criticize relentlessly.

The plot of Mr. Allen's story is built on an impossible foundation. In no recognized religious order is a nun

allowed to go out alone. This is one of the strictest of conventual rules, and is never broken under any circumstances; therefore in the charitable visitations to the cottage "Sister Dolorosa" would most certainly have been accompanied by another nun, and in consequence her trysts with Gordon would have been rendered impossible. She is described as going to the church at night and meeting her admirer by accident on the steps. Nuns usually sleep in dormitories divided off into cells by means of thin muslin curtains only, and it is hardly probable, although of course possible, that one of the number could steal out without attracting the attention of some of her companions, or that she herself would take the risk of going to the church and getting back to bed again, knowing that detection of her act, as an infringement of the vow of obedience, would subject her to a severe reprimand. It is said that weeks passed by and she did not confess. All nuns are required to go to confession once a week, so her failure to confess her trouble is also improbable. In a convent all letters pass through the hands of the Mother Superior. As "Sister Dolorosa" looked at the envelope with indifference she could not have recognized her lover's chirography, and would therefore have had no motive in breaking the rules of her order by reading her letter without first submitting it to the superior, or obtaining permission to read it.

Again, Mr. Allen may not know that in America, with the exception of one or two orders, nuns are not allowed to make perpetual vows, and if "Sister Dolorosa" found her affections irrevocably given to an earthly love, her way was clear to preserve her conscience and her heart too by an appeal to Rome for a dispensation, or by calmly waiting until the term of her vows expired and left her free. Also, in every convent there takes place at certain intervals what is called "the manifestation of conscience," during which any sister who desires to do so may tell the bishop under the veil of secrecy, and without even making known her name, of the anxieties either spiritual or temporal she may have, or if there be anything objectionable about the convent or its management; and if "Sister Dolorosa" had "manifested her conscience" her troubles would probably have been speedily untangled.

The whole plot would have to be reconstructed in order to make it probable or even possible. Fiction, when it transcends the sensational variety, is expected to be true to life, and judged according to that standard "Sister Dolorosa" is a failure. A nun who falls in love after she enters the convent is an anomaly. One may concede without any disrespect to the "religious" in general that in some cases it may be for the want of an opportunity, for it belongs to fallible human nature to make mistakes, and a woman whose vocation it was to live in the world and to get married may have entered the convent in a moment of misapplied zeal; but a fire, even the immaterial fire of love, cannot burn very brightly or very long without some kind of fuel. Mr. Howells in his criticism of "The Senator" says, apropos of Mrs. Armstrong, that "the pursuit of wives by villains is so very uncommon in our society as to be scarcely representative or typical." And with greater truth it may be said in regard to nuns that affairs of the heart are so uncommon as not to be typical.

Catholics must regret that Mr. Allen went to Balzac, Daudet, and Valera for his types of the nun in fiction,

and they must decidedly object to his assertion that those famous gentlemen are "devoted Catholics." They are hereditary Catholics, but their devotion is entirely of a negative description. Had he gone to Madame Craven, whose works are deservedly popular among the most cultivated readers in France, his ideas might have been different and more correct. There are a number of writers in Spain whose types of the religious character have been most beautifully and faithfully portrayed. Mr. Allen has also been unfortunate in his models of Catholic types in general. An examination of the stringent rules and severe discipline of any theological seminary would convince him that "Pepita Ximenez" is an impossible character. "Father Gaucher" is another, as a peep into a child's catechism would inform him, for a Catholic is taught that he is bound to flee the occasion of sin, and the prior of the monastery would have incurred the ban of mortal sin had he even permitted the weak father to continue his wine-making after learning his temptation, let alone compelling him to do so.

Foreign novelists who are not practical Catholics are hardly satisfactory authorities in regard to Catholic teaching and Catholic life. All religious denominations are conceded the privilege of themselves saying what they believe, and this privilege Catholics also claim. The Methodists, Quakers, and Shakers, whom Mr. Allen brings forward as having been freely used in fiction without making any outcry, were not portrayed in types antagonistic to their teachings and history. Had a Methodist deacon in good standing been represented as dancing the York at a public ball, a minister playing poker, a Baptist on a spree, a Presbyterian cheating at cards, a Quaker running a gambling-den, and their acts upheld

or covered up by their church authorities, there would probably have been objections—from the church-members on the score of inaccuracy, and from the critics on that of "bad art."

And now to answer Mr. Allen's questions. Certainly the American writer may avail himself of the conventual and monastic life as material for his art, but it does not follow by any manner of means that the tales located need give offense; on the contrary, if the portrayal be true to the type of monk and nun best known both to Protestants and Catholics, a great deal of pleasure may be afforded. He is also at perfect liberty to make use of unworthy monks and nuns, of unhappy ones, provided always that they are drawn true to life, and that the teachings of the Church and her discipline are not misrepresented. Most assuredly it is his privilege to "attack the Catholic idea," if he really knows what is the "Catholic idea," and that he is not attacking the creation of his own fancy set up as the Catholic idea. To concede yet more, he is at liberty to make use of any event in the history of the Church, any of her doctrines, practices, ceremonials, and institutions, either in praise or blame, if he make his delineations correct. Catholics insist only that the Church be not held responsible for the acts of individual members, nor for teachings imputed to her which her own creed does not confirm. Surely any Protestant denomination would put the same limitations.

As Mr. Allen's article on Gethsemane was both interesting and truthful, and as he gives no hint of malice in his story, Catholics are hopeful that his next venture in fiction will be free from the offenses and inaccuracies of his latest.

L. H.

IN LIGHTER VEIN.

Kitty, my Colleen.

KITTY, my colleen, 't is you that look winsome
Spinnin' the wool, with your beautiful smile.
L'ave off and let your ould grandmother spin some,
I 've somethin' to whisper you out at the stile.
Troth! with your locks, love, so daintily curlin',
Your lips, that keep hummin' a fortunate tune,
And your weeshy white hands, that are twistin' and
twirlin',
You 're windin' my heart on the spindle, aroon!
Arrah thin, Kitty,
It's you that look pretty,
S'tated so sweet at your ould spinnin'-wheel;
Winsome and winnin',
The while you keep spinnin'
My fate with your nate little ankle and heel!

You need n't mind tossin' your tresses so flaxen,—
Begorra, they 're fair as a fortune o' gold,—
And your hand, Kitty dear, is so weeshy and waxen,
The soggarth should give it to some one to hold.
And lips must be kissed if they 're redder than cherries,
And an arm sure was made to encircle a waist;
Faix! your lips are so like a bunch o' ripe berries,
I 'm thinkin', alanna, of thryin' a tashte.
Arrah thin, Kitty,
It's you that look pretty,
S'tated so sweet at your ould spinnin'-wheel;
Winsome and winnin',

The while you keep spinnin'
My fate with your nate little ankle and heel.

Tundher and turf! it's a shame beyond sinnin'
To sit so provokingly silent, asthore;
It's high time for colleens to l'ave off their spinnin'
Whin the moon and their bouchals peep in at the
door;
So come to your Barney, my darlin' so winsome,—
Ah! Kitty, you 're breakin' my heart with your
smile,—
Whisht! aisy, aroon, let your grandmother spin some,
I 've somethin' to whisper you out at the stile.
Arrah thin, Kitty,
It's you that look pretty,
S'tated so sweet at your ould spinnin'-wheel;
Winsome and winnin',
The while you keep spinnin'
My fate with your nate little ankle and heel.

Patrick J. Coleman.

The Prophets.

TIME was we stoned the prophets. Age on age,
When men were strong to save, the world hath slain
them.
People are wiser now—they waste no rage—
The prophets entertain them!

Charlotte Perkins Stetson.

Brer Fox en de Ole Black Duck.

IN the concoction of new tales about impossible heroes among the animal tribes, and in the improvisation of new tunes and lullabies, the old colored "mammy," before the war, displayed a creative talent that is simply a marvel, as it is, in certainty, a mystery. The nightly demands of the younger generation for "a new story" whetted her wits, and stimulated her imaginative faculties to such an extent that the process of going to bed was joyfully contemplated by the children, because it meant for them a feast of fancy and an ever-varied entertainment.

I recall the face and form of one who displayed extraordinary tact and talent in the stories she wove and the tunes she devised for my entertainment when "the children's hour" drew nigh. I see her as I write—a broad, generous countenance, the color of burnt sienna, and shining like polished mahogany; a benignant smile playing about the large mouth; a motherly expression gleaming from eyes that sparkled with unmistakable intelligence; and a voice surcharged with kindness and full of genuine pathos.

At the mention of Mammy 'Riah's name a flood of "half-forgotten lore" rushes to me, and I catch the air and recall the words of one of her songs through whose soporific influence I have more than once forgotten the little cares of my childhood world. The music is just as she sang it; the words have been altered only where the meter and the rhyme seemed to suggest a change.

This is the song that Mammy 'Riah called "Brer Fox en de Ole Black Duck":

BRER FOX jumped up one moonshine night,
En axed de moon to gi' him light;
'Ca'se he mus' run wid all his might,
Ergin he reach de town-o.
Town-o! Town-o!
'Ca'se he mus' run wid all his might,
Ergin he reach de town-o.

So w'en he reach de farmer's yard
De ducks and geese dey raced en r'ared.
"De best ob you shall die," he 'clared,
"Befo' I leab dis town-o."
Town-o! Town-o!
"De best ob you shall die," he 'clared,
"Befo' I leab dis town-o."

He grabbed de black duck by her neck,
En swung her up ercross his back.
De ole duck she go "Quack! quack! quack!"
Wid foots er-danglin' down-o.
Down-o! Down-o!
De ole duck she go "Quack! quack! quack!"
Wid foots er-danglin' down-o.

Ole Aunt Widdle Woddle jumped out er bed,
Out ob de winder poked her head.
"O John, John, John, de black duck 's dead!
Brer Fox am in de town-o!"
Town-o! Town-o!
"O John, John, John, de black duck 's dead!
Brer Fox am in de town-o!"

Den John went out on top de hill,
En blowed his horn dat 's loud en shrill;
But Brer Fox he laugh fit ter kill,
"I done got frough de town-o!"
Town-o! Town-o!
But Brer Fox he laugh fit ter kill,
"I done got frough de town-o!"

He drug de black duck to his den,
Whar he hab young uns, nine er ten;
He to' her up en eat her, w'en
De young uns picked de bones-o!
Bones-o! Bones-o!
He to' her up en eat her, w'en
De young uns picked de bones-o!

Edward A. Oldham.

Grace After Meat.

I WILL not tell you where she lived; too much Already has been said; it would be spiteful. Many unkind remarks are made by such As live in places far, far less delightful. Be this enough; it may be plainly stated Her mind was very highly cultivated.

He was a stranger from a western wild,
And he knew naught of clubs that study Browning.
At first he thought her charming when she smiled,
And then he thought her so when she was frowning.
She studied him with care, as representative,
And his advances, for a while, were tentative.

He misinterpreted the pretty blush
Which dyed her cheek sometimes when he was speak-
ing;
And so it was that after a small hush,
One day, he told her he love was seeking.
The blush was caused, not by her heart's wild clamor,
But by some obvious lapses in his grammar.

She looked distressed, perplexed, uncertain; then
She gently said, "You honor me too greatly;
It might have been"—she sighed, and sighed again—
"But for the sorrow you have caused me lately
By showing,"—here a natural hesitation
Ensued,— "excuse me, lack of cultivation.

"Should I accept the offer of your heart
'T would be my painful duty, without shrinking,
To take your commonest remarks apart;
To make you see that even in your thinking—
Although I do believe you mathematical—
You are not, and have never been, grammatical.

"I could not do this thing to one I loved,
And, should I do it, you would cease to love me.
Forget me, then; you can; it has been proved;
No argument, my friend, can change or move me.
Farewell. I say it in its widest senses.
Distract your mind by studying moods and tenses."

"Bless you!" he said with fervor as he rose,
And shook her hand with honest cordiality,
Seeing quite plainly that she meant to close
The interview, and its extreme finality.
"For what we 've *not* received!" she heard him
mutter,
As he went down the steps, and she peeped through
the shutter.

Margaret Vandegrift.

Ho for the Desert!

OH, ho for the wild, woolly West!
 Ye tender, come forth and invest;
 Come fly up the flume
 In the real-estate boom
 Among the financially blest!

Oh, ho for this woolly, wild land
 Of the lava-beds, desert, and sand,
 Where the ox lies stark,
 And the coyotes bark,
 And the horse is too small for his brand!

The brakeman rules over the train,
 The sage-bush is lord of the plain,
 The prairie-dog kneels
 On the back of his heels,
 Still patiently praying for rain.

So balmy and mild is the air
 That the redskin needs only to wear
 A cool tomahawk,
 And a handy scalp-lock,
 With a feather or two in his hair.

Then ho for the desert so blest,
 In the heart of the woolly, wild West,
 Where all things consume
 With perennial boom—
 Ye tender, come forth and invest!

George E. de Steiguer.

My Old Skippers.

DEAR are Nantucket's sands to me,
 Its wrinkled sands, and brown;
 Dear are the open sea-sprayed moors
 That skirt the dear old town.
 But dearer far its skippers are,
 The skippers whom I sing;
 And to me more than moor or shore
 The moorings where they cling.

When rounding Brant Point on the right,
 You come upon the town,
 My skippers, too, loom into view,
 Sun-dried, and seamed, and brown.
 You see them sitting on the wharf,
 Where they last summer sat—
 The good old wharf that berths alike
 The sea-dog and his cat.

Of in that cat, with sheet hauled flat,
 'Adzooks! I've sailed the rips,
 While Obed rolled his quid and told
 What he had seen in ships:
 Of flying fish that came at night
 And roosted in the tops;
 Of chariot wheels that foul the flukes
 When down an anchor drops.

Though Red the sea where this should be,
 The Black he oft would name;
 And if you doubted but the wheel,
 Up Pharaoh's chariot came!
 He told us, too, how cannibals
 Would waver and retreat,
 If he but showed his pictured arm—
 And their tattoo was beat!

The wind the while was dead ahead,
 But right into its eye
 Good Obed talked—I mean he steered—
 As straight as he could lie.

All vain to praise the paths of truth
 And point the happy goal
 To him whose heaven 'Sconset was,
 And Sheol but a shoal.

Becalmed, with reminiscent breath
 They filled their threadbare sails,
 And on the wharf of afternoons
 Would speak of gales and whales—
 How on some ground just off Japan
 They grappled with typhoons,
 Or in the life of great sperm-whales
 Drove deep their red harpoons.

Ah, me! the loitering winters come,
 The swift-winged summers go;
 One season came with joy and guests—
 But found not Captain Joe!
 And now with apprehensive glance
 I question wharf and wave;
 A boat swings idly to its chain—
 But where is Captain Dave?

Is it that in yon blue above
 These missing seamen sail?
 And manning Argo in the skies,
 Strike they the starry Whale?
 For me it were no sorry fate,
 Free from all moil below,
 To cruise in some celestial craft
 With Captain Dave or Joe!

The harbor light burns clear and bright,
 But past its ruddy glare
 Do sails still glide to seas outside
 And no wave tell us where?
 Still as of yore stretch moor and shore,
 And still I sail the rips;
 But where are they, these skippers gray,
 Who sailed not hence in ships?

Charles Henry Webb.

The New Street-sweeper.

It is not the starving girl, with fingers bony and blue,
 Who sees the gleam of gold in a penny's coppery hue.
 It is not the wrinkled crone, hardened to misery's
 doom,
 Who could ride on a witch's jaunt by mounting her
 worn-out broom.

It is not the huge machine, with clank of its iron
 rhyme,
 That murders your sleep serene, and strangles the
 steeple's chime.
 'T is a queen, of form so fair that a colder heart might
 deign
 To kiss in a rapture sweet the hem of her regal train.

But I pause in wonder mute to see that queenly train
 Sweep through the dust that clings, and drag through
 mires that stain,
 Careless of costly lace, reckless of sheen that shines
 From the rich brocade that weaves suggestive sinuous
 lines.

I think of the fable traced by poets in myths of old,
 A sorceress fair to the waist, and below, a snake un-
 rolled;
 And I fear the legend is true, as I look on her forehead
 pale,
 For the woman I dreamed I knew leaves behind her
 a serpent's trail.

THE HOLY FAMILY. BY FRANK VINCENT DU MOND.

CHRISTMAS NUMBER.

THE CENTURY MAGAZINE.

VOL. XLIII.

DECEMBER, 1891.

NO. 2.

THE CHRIST-CHILD.

I.

ONE is the day of care.
Into the shadowy room
Flows the pure evening light,
To stem the gathering gloom,
The lily's flame illumine,
And the bowed heads make bright—
The heads bowed low in prayer.

II.

See how the level rays
Through the white garments pour
Of the holy child, who stands,
With bending brow, to implore
Grace on the toilers' store;
Oh, see those sinless hands!
Behold, the Christ-child prays!

III.

Wait, wait, ye lingering rays,
Stand still, O Earth and Sun,
Draw near, thou Soul of God—
This is the suffering one!
Already the way is begun
The pierced Saviour trod;
And now the Christ-child prays—
The holy Christ-child prays.

ITALIAN OLD MASTERS.

RAPHAEL.—1483-1520.

(RAFAELLO DI GIOVANNI SANTI.)

UNDISPUTED prince of painters for more than three centuries, not another of the magnates in art of the Italian Renaissance has been in the last two generations so belittled and belauded, by turns and by sects, as Raphael. And not another shows so luminously the advantages and the dangers of the system of art education which made the Renaissance what it was. When he began to paint we do not know, nor is it certain under whom, but probably his father, Giovanni Santi, was his first master. Vasari's love of the marvelous always led him to an overcoloring of what he most admired or disliked, so that none of his statements can be accepted implicitly when his sympathies or antipathies are enlisted; and his admiration of Raphael was unbounded. It was in part the reflection of the tone of his time, in which the personal charm of the brilliant painter, who died when all the world of Rome considered him at the threshold of a greater destiny, still prejudiced all criticism. Late and scientific investigation has furnished some confirmation and some contradiction of Vasari, and for the last half-century Raphael has become the subject of antagonistic appreciations—the logical consequence of unintelligent laudation.

He was born at Urbino,—so much seems certain,—and in the year 1483; Vasari says on the 28th of March, a Good Friday, though Grimm and later researches make it April 6; but there is no record of the event by contemporary authority, nor do those who make pilgrimages to the house where he is supposed to have been born have any assurance of its being his birthplace. His name appears for the first time in his father's will, and all the details of Vasari concerning his infancy are questionable, or even disproved by positive evidence. Raphael's mother, Magia, died in 1491, and his father married again in the following year, and died in 1494, when the boy was eleven. Of what had been done before that by his father to educate him in the practice of art, or what was done immediately after, we know nothing; all the marvels of Vasari, Passavant, and Grimm are of the very lightest authority.

What we can, with some chance of probability, conclude under the circumstances which we know is that, as Raphael's father had taken up painting with a reverential feeling for the art which is betrayed in his poetry, he would hail the first signs of a devotion to it in his only son, and would give him full play for his early efforts, which, from the general evidence we possess of the precocity of the youth, we may conclude to have been of high promise. It would be quite beyond all human probability that under those circumstances the father should not have imparted such education as was in his power; and as the artistic training of that time was in its early stages a purely technical one, full of conventional rules and methods mainly calculated to develop facility of execution and produce a stereotyped result in which, with all the acumen of modern investigation of styles and methods of execution, it is often impossible to determine the authorship of a work, the requisite education must have been quite within the father's competence. Colors were combined according to formula for all objects; the shadows of flesh had certain pigments, and the lights certain others; the conception of an imitation of nature in the modern sense had not entered into art; and the early training of the apprentice was in grinding colors, preparing grounds, tracing the designs of the master on the panel, and, as power increased, in doing by rule more or less of the actual painting. These processes Giovanni Santi must have learned before he could be considered a painter, and these he must have been competent to teach his son; and as we know that in the case of some of the masters of the epoch the studio-training began at the age of eight, when the boys were sent away from home to the master's house, we need strain no probabilities in supposing that the young Raphael might have been indulging his precocity at seven, or even at six, in his home and under his father's eye, and that at the time of his reception in the studio of Perugino (which we have no data to place earlier than 1500, though it may have taken place in 1495 immediately after his father's death) he knew already the elements of the painter's art well enough to become a valuable assistant. The question where Raphael spent the years

between his father's death and the recognized date (1500) of his being at work with Perugino has been discussed with a superabundance of hypothesis. He has been assigned to Timoteo della Vite and to Signorelli, but on no evidence whatever. We have no trace of the influence of any other painter than Perugino in his work, for as we know nothing of the style or attainments of Giovanni Santi we cannot pretend to find his manner in it. But it is not difficult to account for the probability of the earliest influence of Perugino, because we know from the poem of Giovanni that he regarded that master as the peer of Leonardo, who at that time was the highest of all the painters of the day in the general estimation; and if Giovanni's own induction into the technic of the art was not due to Perugino, there can be no question that he absorbed what was possible from that master's work and carried it into his own. What he taught Raphael then was certain to be, as far as he could make it, what he had learned from Perugino; and there is another consideration which adds strength to this hypothesis—the fact that Perugino was the master of the day who taught most successfully those technical attainments which were the elements by which a painter was judged and his rank assigned. Originality of conception or treatment stood for little in comparison with good workmanship, the possession of a correct method of using the colors, and the ability to design harmoniously. Perugino was generally recognized as the strongest painter of the time in fresco; he knew how to do better what he set before himself to do than any other painter, and this was the standard by which the artist of that time was assigned his rank. Nor is there any foundation for the assumption that Giovanni, considering his knowledge of art insufficient, himself sent the boy to Perugino. Supposing him to have been a bad artist, which we have no right to assume, he was less likely to hold this opinion of himself than if he had been a good one, and all that we really know of the matter tends to indicate that he was the only master Raphael had before going to work with the greater one.

The "*Sposalizio*," as it is called, the "*Marriage of the Virgin*," a picture which shows the extent of his obligation to Perugino, is the first of Raphael's works to which we can fix a date. It was painted in 1504, and in the main is a refinement on, and a more complete carrying out of, the same subject as painted by Perugino, and must be considered as a tribute to the master. About this time Raphael went to Florence, and returning to Perugia he painted the "*Entombment*" for Baglioni, the head of the ruling family in that city. This picture was painted in 1507, and the progress, or modifi-

cation, of his ideas during the interval between it and the "*Sposalizio*" indicates the effect that Florentine art had had on him. He returned to Florence, and after what must have been a very short stay there was called to Rome by Julius II. We do not know the date, but it was between 1508 and 1510. Julius summoned to Rome all young artists who gave promise of great abilities, to assist in carrying out the grand schemes of decoration which he had conceived for the Vatican.

To Raphael was first assigned for decoration the room of the Signature. Here he showed that his intercourse with men of letters and the more liberal artists of Florence had opened another world of thought and art interest to him, and the series of what may be called his philosophical allegories has nothing to do with the world of Perugino, or with the purely religious art of the preceding generation. The mystic meanings and the lofty speculation which some of the German critics find in the frescos of the Vatican have nothing to do with art. If I accepted them I should lay to their charge the decay in the art itself which the latest work of Raphael shows; but I believe that the hidden philosophy was not put there by the painter, that he simply tried to arrange his subjects so as to make the most harmonious arrangement, and that the philosophy, theology, and mythology were borrowed from his society and surroundings.¹ He had seen the great compositions of Masaccio at Florence, and in them learned a lesson Perugino never knew; he carried the motive of this lesson further, and in some respects worked it out more completely. But to admit that he meant what Grimm finds in the compositions is to me impossible—so much speculation would have killed the art. The fact is that Raphael had an extraordinary and, so far as we can judge by the history of painting, unique power of absorbing the ideas and feelings of other men. He caught the color of every great artist he approached, and the marvelous facility of design he had acquired by his early training, seconded by a phenomenal power of invention, enabled him sometimes to surpass in their own way the work of the men he emulated.

The second room of the Vatican—that of the Heliodorus, etc.—is designed more in accordance with the artist's individual feeling, and furnishes some passages of composition which must remain as the highest attainment of Raphael's invention in this vein. Before it was finished Julius died, and was succeeded by Leo X., under whose pontificate Raphael became the arbiter of art in Rome. Michelangelo was driven by neglect from the pontifical court, and

1 It is well determined that his inspirer in philosophy and archæology was Cardinal Bembo.

ENGRAVED BY T. COLE, FROM THE ORIGINAL FRESCO IN THE VATICAN.

RAPHAEL'S FRESCO "PARNASSUS."

retired to Florence, leaving Raphael alone and supreme.

The room of the Stanze was begun in 1515, and was followed by the hall of Constantine and the Loggie in a sequence of design and execution which for its extent, even with allowance for the aid of his pupils, is incomprehensible to the modern painter. During this period he was introduced by stealth into the Sistine Chapel, as the legend goes, and saw the ceiling of Michelangelo, which once more modified his art in a manner which is more remarkable than all the previous developments. The effect of this is seen in the frescos in the church of Sta. Maria della Pace in Rome. The Cartoons give us what on the whole seems to me the most triumphant achievement of Raphael in this vein of design, and I should rank them as the highest examples of what is generally understood as academic composition, that art which being still pure art approaches the region of artifice so closely as to be, to certain minds, indefensible. I shall not discuss the matter here, but simply say that, in my opinion, to exclude this phase of Raphael's art from the classics of art would be as absurd as to exclude the "Paradise Lost" from classical English literature. What shows the real decadence of the painter is the purely mythological work of his later years, the Galatea, and the Cupid and Psyche in the Farnesina. The Cartoons were finished in 1516. Raphael had now grown rich and famous as no artist of his epoch had dreamed of becoming; he had made art itself a more noble profession than it had ever been admitted to be, raising what had been held only as a craft and mechanical occupation, paid by the month, like those of masons and builders, to the consideration of a liberal profession. Titian and Michelangelo had contributed to this education of society, but in a less degree than Raphael, who could by marriage have allied himself with one of the princes of the Church, a dignity of which nowadays we can hardly estimate the importance. Rome was the capital of the civilized world, the cardinals took precedence of princes of the blood, and the Pope deposed sovereigns.

Whatever one may feel in regard to any particular phase of Raphael's art, there is a wide range of choice. My personal feeling is a preference for the earlier stage of his evolution, marked most graciously by the "Madonna del Granduca." The "Madonna di San Sisto" at Munich palls somewhat on me; the "Sediola" has less of the artist's peculiar, spiritual refinement; and most of the other madonnas have something in the composition which was imposed or forced. But the Virgin of the "Granduca" has the simplicity of a Greek statue and the sweetness of a Christian saint. I cannot

follow or understand the maybe subtle, and maybe purely fantastic, analyses of Grimm in his "Life of Raphael," which seems less a biography than a metaphysical discussion of the sixteenth century, its art and its artists, in which discussion the conclusions are often based on premises in the air. Thus the conclusions he draws on the "Coronation of the Virgin" are founded on certain silver-point drawings which he considers to have been Raphael's studies for it; but a more competent technical critic than he declares these drawings to have been the work of some subsequent student of Raphael, and drawn from the picture. Yet on this premise Grimm constructs the history of the evolution of Raphael's early art! Whatever these drawings may be, or by whom, there is no evidence to connect them with Raphael himself; and the mysterious and sudden change of style in the manner of the artist on which Grimm bases such surprising conclusions, and of which he offers no satisfactory explanation, ceases to offer any difficulty if we understand that the silver-point drawings are simply studies of Raphael by one of his later admirers.

There is much that is surprising, but nothing mysterious, in the career of Raphael. His was one of those extraordinary and precocious natures which ripen quickly and decay as rapidly, condensing life and work into a fraction of the time a slower and more massive intellect would have taken to complete its evolution. He must have begun at an abnormally early age, and he finished at thirty-seven, with his best work done and his highest inspiration exhausted. He had an organization of extreme sensibility, which responded, with a docility quite unique in the history of art, to the influence of any strong mind that approached him, with a facility of invention which adapted all to his own purposes; but in his personal right he had a refinement of perception which enabled him to add to what he borrowed a subtlety and grace which made it his own. To realize fully his power of design we must study the drawings he made for his pictures. In the academical qualities of drawing he has never had an equal, and the fertility and rapidity of his invention are shown by the enormous number of works he has left. These gifts make him the great master for serious students of painting in its larger field,—that of expression of the artist's thought,—and I have heard the greatest of modern idealists, Jean François Millet, talk by the hour with the highest enthusiasm on a portfolio of the Raphael drawings as the *ne plus ultra* of design in its best sense. For the modern type of painter, the man who regards his function to be that of a mirror to nature, or who considers nature his mistress rather than his purveyor, and his brush-work

PORTRAIT OF MADDALENA DONI, BY RAPHAEL.

ENGRAVED BY T. COLE, FROM THE ORIGINAL IN THE PITTI GALLERY, FLORENCE.

more important than his conception, Raphael is no model, and for such he has no lesson. The tendency of all modern painting is more and more to these characteristics, so that he who will understand the Urbinate in all his breadth must turn his back on all the modern schools (if there be anything now which deserves the name of school), and build his judgments on a standard found in the range of work from Masaccio to Michelangelo. By this standard

Raphael must be given, if not the supreme rank which his contemporaries gave him, at least a place in the front rank among the half-dozen who have endowed art with a higher nobility; and among them all he stands first for the sense of beauty, and next to Michelangelo for refinement; first as academician and composer, and side by side with Giotto for fertility of invention. This is enough of honor.

W. J. Stillman.

NOTE TO THE "MADONNA DEL CARDELLINO" (GOLDFINCH).

THE gem of Florence—the "Madonna of the Goldfinch"—hangs in the Tribune of the Uffizi. It is painted on wood, and measures three feet one inch high by two feet five inches wide. The Virgin is seated upon a rock, within a quiet landscape—a portion of the environs of Florence as seen from a point of view going toward Fiesole along the stream Mugnone. To the left, spanning it, is the bridge Badia. To the right is Florence, with the Tuscan hills beyond. The whole is bathed in a soft and mellow light, as in a dream.

The child Jesus, leaning against his mother's lap, has been reciting from the book she holds, when he is interrupted by his companion, the little St. John, who has caught a bird, and, panting, has come with it in glee to Jesus. He grasps it as a child might, with both hands, regardless of hurting it. Note the roundness of his form, his shock of curls, and his animal spirits, as contrasted with the lithe figure and pensive attitude of Jesus—the deep expression of love and tenderness in his face as he raises his hand and gently caresses the bird. This is the most wonderful Christ-child that I have yet seen painted. We see the usual nimbus encircling the heads of the Madonna and the Baptist, but in the case of Jesus I could discover nothing upon first glance, and I thought this worthy of note.

My friend Mr. C. F. Murray, however, called my attention to certain fine and delicate rays of gold very close to the head—three or four at the top and the same number on each side, forming, as it were, three arms of a cross. They are barely to be seen even upon a close inspection, but doubtless they are there. They could not, however, be engraved in my coarse reduction without exaggerating their value, and this would be to the detriment of the expression of the child's face, which is of far more importance. It is plain that Raphael intends that the glory of the child shall be seen in the beauty of its figure and the expression of its face, heavy with love—as near to divinity as might be.

How placid and sweet is the Virgin! The very essence of all sweetness—classic in pose, reminding us of the antique Greek statues, and of a purity and beauty peculiar to the genius of its author. The picture was painted for Lorenzo Nasi, Raphael's friend, on the occasion of his marriage. In 1547, twenty-seven years after the death of Raphael, Nasi's palace, which stood on the hill of S. Giorgio, was ruined with many others by the sinking of the hill. This picture was then broken into twenty or thirty pieces, but was recovered and restored by the son of Lorenzo, a great lover of the arts.

Timothy Cole.

AT FIRST.

IF I should fall asleep one day,
All overworn,
And should my spirit, from the clay,
Go dreaming out the heavenward way,
Or thence be softly borne,

I pray you, angels, do not first
Assail mine ear
With that blest anthem, oft rehearsed,
"Behold, the bonds of Death are burst!"
Lest I should faint with fear.

But let some happy bird, at hand,
The silence break:
So shall I dimly understand
That dawn has touched a blossoming land,
And sigh myself awake.

From that deep rest emerging so,
To lift the head
And see the bath-flower's bell of snow,
The pink arbutus, and the low
Spring-beauty streaked with red,

Will all suffice. No otherwhere
Impelled to roam,
Till some blithe wanderer, passing fair,
Will, smiling, pause—of me aware—
And murmur, "Welcome home!"

So sweetly greeted I shall rise
To kiss her cheek;
Then lightly soar in lovely guise,
As one familiar with the skies,
Who finds and need not seek.

Amanda T. Jones.

THE ARRIVAL OF THE SHEPHERDS. BY H. LEROLLE.

THE SHEPHERDS.

I SENEX.

PERCHANCE the light we followed till it stayed,
Piercing the roof, now runs along the shade.

2 SENEX.

No, no; before we came the light was here.
It blinded me, but now mine eyes are clear,
Or else the dartling splendor grows more mild,
And I behold a mother with her child.

I JUVENIS.

Upon her breast how peacefully it lies!

2 JUVENIS.

What love is shining in the mother's eyes!

I JUVENIS.

It is a dream. Such dreams at break of day
Do often come, but never will they stay.

2 JUVENIS.

Hast dreamed this dream before? The powers above
Send gracious messengers to those they love;
They love thee well—and so have sent to thee.
And I have heard that over the great sea
Some bard or singing shepherd has foretold
A child should bring again the age of gold;
And when that age was come, the vine, the field,
Unfurrowed and unpruned, their fruit should yield,
While honey-drops should break from out the oak.
Nor longer should the ox endure the yoke,
Nor flock nor keeper from the lion flee.
Dost think this little one that child could be?

I SENEX.

Hushed be those Roman tales; and mark thou well
That thou this blessed thing mayst rightly tell
To those who ask, when thou art sad and old,
And thy weak steps not far shall stray from fold.

2 JUVENIS.

Methinks I never shall be sad again,
Ev'n when I sit among the aged men.
For in that glooming time will I recall
This light that like the noon sun lights us all;
And its remembered glow shall warm and bless.

2 SENEX.

Kneel! kneel! This is the Sun of Righteousness!

Edith M. Thomas.

"I SPOKE OF THE SHADRACH." (SEE PAGE 179.)

ENGRAVED BY J. H. E. WHITNEY

THE CHRISTMAS SHADRACH.

BY FRANK R. STOCKTON.

HENEVER I make a Christmas present I like it to mean something, not necessarily my sentiments toward the person to whom I give it, but sometimes an ex-

pression of what I should like that person to do or to be. In the early part of a certain winter not very long ago I found myself in a position of perplexity and anxious concern regarding a Christmas present which I wished to make.

The state of the case was this. There was a young lady, the daughter of a neighbor and old friend of my father, who had been gradually assuming relations toward me which were not only unsatisfactory to me, but were becoming more and more so. Her name was Mildred Bronce. She was between twenty and twenty-five years of age, and as fine a woman in every way as one would be likely to meet in a lifetime. She was handsome, of a tender and generous disposition, a fine intelligence, and a thoroughly well-stocked mind. We had known each other for a long time, and when fourteen or fifteen Mildred had been my favorite companion. She was a little younger than I, and I liked her better than any boy I knew. Our friendship had continued through the years, but of late there had been a change in it; Mildred had become very fond of me, and her fondness seemed to have in it certain elements which annoyed me.

As a girl to make love to no one could be better than Mildred Bronce; but I had never made love to her,—at least not earnestly,—and I did not wish that any permanent condition of loving should be established between us. Mildred did not seem to share this opinion, for every day it became plainer to me that she looked upon me as a lover, and that she was perfectly willing to return my affection.

But I had other ideas upon the subject. Into the rural town in which my family passed the greater part of the year there had recently come a young lady, Miss Janet Clinton, to whom my soul went out of my own option. In some respects, perhaps, she was not the equal of Mildred, but she was very pretty, she was small, she had a lovely mouth, was apparently of a clinging nature, and her dark eyes looked into mine with a tingling effect that no

other eyes had ever produced. I was in love with her because I wished to be, and the consciousness of this fact caused me a proud satisfaction. This affair was not the result of circumstances, but of my own free will.

I wished to retain Mildred's friendship, I wished to make her happy; and with this latter intent in view I wished very much that she should not disappoint herself in her anticipations of the future.

Each year it had been my habit to make Mildred a Christmas present, and I was now looking for something to give her which would please her and suit my purpose.

When a man wishes to select a present for a lady which, while it assures her of his kind feeling toward her, will at the same time indicate that not only has he no matrimonial inclinations in her direction, but that it would be entirely unwise for her to have any such inclinations in his direction; that no matter with what degree of fondness her heart is disposed to turn toward him, his heart does not turn toward her, and that, in spite of all sentiments induced by long association and the natural fitness of things, she need never expect to be to him anything more than a sister, he has, indeed, a difficult task before him. But such was the task which I set for myself.

Day after day I wandered through the shops. I looked at odd pieces of jewelry and bric-à-brac, and at many a quaint relic or bit of art work which seemed to have a meaning, but nothing had the meaning I wanted. As to books, I found none which satisfied me; not one which was adapted to produce the exact impression that I desired.

One afternoon I was in a little basement shop kept by a fellow in a long overcoat, who, so far as I was able to judge, bought curiosities but never sold any. For some minutes I had been looking at a beautifully decorated saucer of rare workmanship for which there was no cup to match, and for which the proprietor informed me no cup could now be found or manufactured. There were some points in the significance of an article of this sort, given as a present to a lady, which fitted to my purpose, but it would signify too much: I did not wish to suggest to Mildred that she need never expect to find a cup. It would be better, in fact, if I gave her anything of this kind, to send her a cup and saucer entirely unsuited to each other,

and which could not, under any conditions, be used together.

I put down the saucer, and continued my search among the dusty shelves and cases.

"How would you like a paper-weight?" the shopkeeper asked. "Here is something a little odd," handing me a piece of dark-colored mineral nearly as big as my fist, flat on the under side and of a pleasing irregularity above. Around the bottom was a band of arabesque work in some dingy metal, probably German silver. I smiled as I took it.

"This is not good enough for a Christmas present," I said. "I want something odd, but it must have some value."

"Well," said the man, "that has no real value, but there is a peculiarity about it which interested me when I heard of it, and so I bought it. This mineral is a piece of what the iron-workers call shadrach. It is a portion of the iron or iron ore which passes through the smelting-furnaces without being affected by the great heat, and so they have given it the name of one of the Hebrew youths who was cast into the fiery furnace by Nebuchadnezzar, and who came out unhurt. Some people think there is a sort of magical quality about this shadrach, and that it can give out to human beings something of its power to keep their minds cool when they are in danger of being overheated. The old gentleman who had this made was subject to fits of anger, and he thought this piece of shadrach helped to keep him from giving way to them. Occasionally he used to leave it in the house of a hot-tempered neighbor, believing that the testy individual would be cooled down for a time, without knowing how the change had been brought about. I bought a lot of things of the old gentleman's widow, and this among them. I thought I might try it some time, but I never have."

I held the shadrach in my hand, ideas concerning it rapidly flitting through my mind. Why would not this be a capital thing to give to Mildred? If it should, indeed, possess the quality ascribed to it; if it should be able to cool her liking for me, what better present could I give her? I did not hesitate long.

"I will buy this," I said; "but the ornamentation must be of a better sort. It is now too cheap- and tawdry-looking."

"I can attend to that for you," said the shopkeeper. "I can have it set in a band of gold or silver filigree-work like this, if you choose."

I agreed to this proposition, but ordered the band to be made of silver, the cool tone of that metal being more appropriate to the characteristics of the gift than the warmer hues of gold.

When I gave my Christmas present to Mildred she was pleased with it; its oddity struck her fancy.

"I don't believe anybody ever had such a paper-weight as that," she said, as she thanked me. "What is it made of?"

I told her, and explained what shadrach was; but I did not speak of its presumed influence over human beings, which, after all, might be nothing but the wildest fancy. I did not feel altogether at my ease, as I added that it was merely a trifle, a thing of no value except as a reminder of the season.

"The fact that it is a present from you gives it value," she said, as she smilingly raised her eyes to mine.

I left her house,—we were all living in the city then—with a troubled conscience. What a deception I was practising upon this noble girl, who, if she did not already love me, was plainly on the point of doing so. She had received my present as if it indicated a warmth of feeling on my part, when, in fact, it was the result of a desire for a cooler feeling on her part.

But I called my reason to my aid, and I showed myself that what I had given Mildred—if it should prove to possess any virtue at all—was, indeed, a most valuable boon. It was something which would prevent the waste of her affections, the wreck of her hopes. No kindness could be truer, no regard for her happiness more sincere, than the motives which prompted me to give her the shadrach.

I did not soon again see Mildred, but now as often as possible I visited Janet. She always received me with a charming cordiality, and if this should develop into warmer sentiments I was not the man to wish to cool them. In many ways Janet seemed much better suited to me than Mildred. One of the greatest charms of this beautiful girl was a tender trustfulness, as if I were a being on whom she could lean and to whom she could look up. I liked this; it was very different from Mildred's manner: with the latter I had always been well satisfied if I felt myself standing on the same plane.

The weeks and months passed on, and again we were all in the country; and here I saw Mildred often. Our homes were not far apart, and our families were very intimate. With my opportunities for frequent observation I could not doubt that a change had come over her. She was always friendly when we met, and seemed as glad to see me as she was to see any other member of my family, but she was not the Mildred I used to know. It was plain that my existence did not make the same impression on her that it once made. She did not seem to consider it important whether I came or went; whether I was in the room or not; whether I joined a party or stayed away. All this had been very different. I knew well that Mildred had been used to consider my pres-

ence as a matter of much importance, and I now felt sure that my Christmas shadrach was doing its work. Mildred was cooling toward me. Her affection, or, to put it more modestly, her tendency to affection, was gently congealing into friendship. This was highly gratifying to my moral nature, for every day I was doing my best to warm the soul of Janet. Whether or not I succeeded in this I could not be sure. Janet was as tender and trustful and charming as ever, but no more so than she had been months before.

Sometimes I thought she was waiting for an indication of an increased warmth of feeling on my part before she allowed the temperature of her own sentiments to rise. But for one reason and another I delayed the solution of this problem. Janet was very fond of company, and although we saw a great deal of each other, we were not often alone. If we two had more frequently walked, driven, or rowed together, as Mildred and I used to do, I think Miss Clinton would soon have had every opportunity of making up her mind about the fervor of my passion.

The summer weeks passed on, and there was no change in the things which now principally concerned me, except that Mildred seemed to be growing more and more indifferent to me. From having seemed to care no more for me than for her other friends, she now seemed to care less for me than for most people. I do not mean that she showed a dislike, but she treated me with a sort of indifference which I did not fancy at all. This sort of thing had gone too far, and there was no knowing how much further it would go. It was plain enough that the shadrach was overdoing the business.

I was now in a state of much mental disquietude. Greatly as I desired to win the love of Janet, it grieved me to think of losing the generous friendship of Mildred — that friendship to which I had been accustomed for the greater part of my life, and on which, as I now discovered, I had grown to depend.

In this state of mind I went to see Mildred. I found her in the library writing. She received me pleasantly, and was sorry her father was not at home, and begged that I would excuse her finishing the note on which she was engaged, because she wished to get it into the post-office before the mail closed. I sat down on the other side of the table, and she finished her note, after which she went out to give it to a servant.

Glancing about me, I saw the shadrach. It was partly under a litter of papers, instead of lying on them. I took it up, and was looking at it when Mildred returned. She sat down and asked me if I had heard of the changes that were to be made in the time-table of the railroad. We talked a little on the subject, and

then I spoke of the shadrach, saying carelessly that it might be interesting to analyze the bit of metal; there was a little knob which might be filed off without injuring it in the least.

"You may take it," she said, "and make what experiments you please. I do not use it much; it is unnecessarily heavy for a paper-weight."

From her tone I might have supposed that she had forgotten that I had given it to her. I told her that I would be very glad to borrow the paper-weight for a time, and, putting it into my pocket, I went away, leaving her arranging her disordered papers on the table, and giving quite as much regard to this occupation as she had given to my little visit.

I could not feel sure that the absence of the shadrach would cause any diminution in the coolness of her feelings toward me, but there was reason to believe that it would prevent them from growing cooler. If she should keep that shadrach she might in time grow to hate me. I was very glad that I had taken it from her.

My mind easier on this subject, my heart turned more freely toward Janet, and, going to her house, the next day I was delighted to find her alone. She was as lovely as ever, and as cordial, but she was flushed and evidently annoyed.

"I am in a bad humor to-day" she said, "and I am glad you came to talk to me and quiet me. Dr. Gilbert promised to take me to drive this afternoon, and we were going over to the hills where they find the wild rhododendron. I am told that it is still in blossom up there, and I want some flowers ever so much — I am going to paint them. And besides, I am crazy to drive with his new horses; and now he sends me a note to say that he is engaged."

This communication shocked me, and I began to talk to her about Dr. Gilbert. I soon found that several times she had been driving with this handsome young physician, but never, she said, behind his new horses, nor to the rhododendron hills.

Dr. Hector Gilbert was a fine young fellow, beginning practice in town, and one of my favorite associates. I had never thought of him in connection with Janet, but I could now see that he might make a most dangerous rival. When a young and talented doctor, enthusiastic in his studies, and earnestly desirous of establishing a practice, and who, if his time were not fully occupied, would naturally wish that the neighbors would think that such were the case, deliberately devotes some hours on I know not how many days to driving a young lady into the surrounding country, it may be supposed that he is really in love with her. Moreover, judging from Janet's present mood,

this doctor's attentions were not without encouragement.

I went home; I considered the state of affairs; I ran my fingers through my hair; I gazed steadfastly upon the floor. Suddenly I rose. I had had an inspiration; I would give the shadrach to Dr. Gilbert.

I went immediately to the doctor's office, and found him there. He too was not in a very good humor.

"I have had two old ladies here nearly all the afternoon, and they have bored me to death," he said. "I could not get rid of them because I found they had made an appointment with each other to visit me to-day and talk over a hospital plan which I proposed some time ago and which is really very important to me, but I wish they had chosen some other time to come here. What is that thing?"

"That is a bit of shadrach," I said, "made into a paper-weight." And then I proceeded to explain what shadrach is, and what peculiar properties it must possess to resist the power of heat, which melts other metal apparently of the same class; and I added that I thought it might be interesting to analyze a bit of it and discover what fire-proof constituents it possessed.

"I should like to do that," said the doctor, attentively turning over the shadrach in his hand. "Can I take off a piece of it?"

"I will give it to you," said I, "and you can make what use of it you please. If you do analyze it I shall be very glad indeed to hear the results of your investigations."

The doctor demurred a little at taking the paper-weight with such a pretty silver ring around it, but I assured him that the cost of the whole affair was trifling, and I should be gratified if he would take it. He accepted the gift, and was thanking me, when a patient arrived, and I departed.

I really had no right to give away this paper-weight, which, in fact, belonged to Mildred, but there are times when a man must keep his eyes on the chief good, and not think too much about other things. Besides, it was evident that Mildred did not care in the least for the bit of metal, and she had virtually given it to me.

There was another point which I took into consideration. It might be that the shadrach might simply cool Dr. Gilbert's feelings toward me, and that would be neither pleasant nor advantageous. If I could have managed matters so that Janet could have given it to him, it would have been all right. But now all that I could do was to wait and see what would happen. If only the thing would cool the doctor in a general way, that would help. He might then give more thought to his practice and

his hospital ladies, and let other people take Janet driving.

About a week after this I met the doctor; he seemed in a hurry, but I stopped him. I had a curiosity to know if he had analyzed the shadrach, and asked him about it.

"No," said he; "I haven't done it. I haven't had time. I knocked off a piece of it, and I will attend to it when I get a chance. Good day."

Of course if the man was busy he could not be expected to give his mind to a trifling matter of that sort, but I thought that he need not have been so curt about it. I stood gazing after him as he walked rapidly down the street. Before I resumed my walk I saw him enter the Clinton house. Things were not going on well. The shadrach had not cooled Dr. Gilbert's feelings toward Janet.

But because the doctor was still warm in his attentions to the girl I loved, I would not in the least relax my attentions to her. I visited her as often as I could find an excuse to do so. There was generally some one else there, but Janet's disposition was of such gracious expansiveness that each one felt obliged to be satisfied with what he got, much as he may have wished for something different.

But one morning Janet surprised me. I met her at Mildred's house, where I had gone to borrow a book of reference. Although I had urged her not to put herself to so much trouble, Mildred was standing on a little ladder looking for the book, because, she said, she knew exactly what I wanted, and she was sure she could find the proper volume better than I could. Janet had been sitting in a window-seat reading, but when I came in she put down her book and devoted herself to conversation with me. I was a little sorry for this, because Mildred was very kindly engaged in doing me a service, and I really wanted to talk to her about the book she was looking for. Mildred showed so much of her old manner this morning that I would have been very sorry to have her think that I did not appreciate her returning interest in me. Therefore, while under other circumstances I would have been delighted to talk to Janet, I did not wish to give her so much of my attention then. But Janet Clinton was a girl who insisted on people attending to her when she wished them to do so, and, having stepped through an open door into the garden, she presently called me to her. Of course I had to go.

"I will not keep you a minute from your fellow student," she said, "but I want to ask a favor of you." And into her dark, uplifted eyes there came a look of tender trustfulness clearer than any I had yet seen there. "Don't you want to drive me to the rhododendron hills?" she said. "I suppose the flowers are all gone by

this time, but I have never been there, and I should like ever so much to go."

I could not help remarking that I thought Dr. Gilbert was going to take her there.

"Dr. Gilbert, indeed!" she said with a little laugh. "He promised once, and did n't come, and the next day he planned for it it rained. I don't think doctors make very good escorts, anyway, for you can't tell who is going to be sick just as you are about to start on a trip. Besides there is no knowing how much botany I should have to hear, and when I go on a pleasure-drive I don't care very much about studying things. But of course I don't want to trouble you."

"Trouble!" I exclaimed. "It will give me the greatest delight to take you that drive or any other, and at whatever time you please."

"You are always so good and kind," she said, with her dark eyes again upraised. "And now let us go in and see if Mildred has found the book."

I spoke the truth when I said that Janet's proposition delighted me. To take a long drive with that charming girl, and at the same time to feel that she had chosen me as her companion, was a greater joy than I had yet had reason to expect; but it would have been a more satisfying joy if she had asked me in her own house and not in Mildred's; if she had not allowed the love which I hoped was growing up between her and me to interfere with the revival of the old friendship between Mildred and me.

But when we returned to the library Mildred was sitting at a table with a book before her, opened at the passage I wanted.

"I have just found it," she said with a smile. "Draw up a chair, and we will look over these maps together. I want you to show me how he traveled when he left his ship."

"Well, if you two are going to the pole," said Janet, with her prettiest smile, "I will go back to my novel."

She did not seem in the least to object to my geographical researches with Mildred, and if the latter had even noticed my willingness to desert her at the call of Janet, she did not show it. Apparently she was as much a good comrade as she had ever been. This state of things was gratifying in the highest degree. If I could be loved by Janet and still keep Mildred as my friend, what greater earthly joys could I ask?

The drive with Janet was postponed by wet weather. Day after day it rained, or the skies were heavy, and we both agreed that it must be in the bright sunshine that we would make this excursion. When we should make it, and should be alone together on the rhododendron hill, I intended to open my soul to Janet.

It may seem strange to others, and at the time it also seemed strange to me, but there was another reason besides the rainy weather which prevented my declaration of love to Janet. This was a certain nervous anxiety in regard to my friendship for Mildred. I did not in the least waver in my intention to use the best endeavors to make the one my wife, but at the same time I was oppressed by a certain alarm that in carrying out this project I might act in such a way as to wound the feelings of the other.

This disposition to consider the feelings of Mildred became so strong that I began to think that my own sentiments were in need of control. It was not right that while making love to one woman I should give so much consideration to my relations with another. The idea struck me that in a measure I had shared the fate of those who had thrown the Hebrew youths into the fiery furnace. My heart had not been consumed by the flames, but in throwing the shadrach into what I supposed were Mildred's affections it was quite possible that I had been singed by them. At any rate my conscience told me that under the circumstances my sentiments toward Mildred were too warm; in honestly making love to Janet I ought to forget them entirely.

It might have been a good thing, I told myself, if I had not given away the shadrach, but kept it as a gift from Mildred. Very soon after I reached this conclusion it became evident to me that Mildred was again cooling in my direction as rapidly as the mercury falls after sunset on a September day. This discovery did not make my mercury fall; in fact, it brought it for a time nearly to the boiling-point. I could not imagine what had happened. I almost neglected Janet, so anxious was I to know what had made this change in Mildred.

Weeks passed on, and I discovered nothing, except that Mildred had now become more than indifferent to me. She allowed me to see that my companionship did not give her pleasure.

Janet had her drive to the rhododendron hills, but she took it with Dr. Gilbert and not with me. When I heard of this it pained me, though I could not help admitting that I deserved the punishment; but my surprise was almost as great as my pain, for Janet had recently given me reason to believe that she had a very small opinion of the young doctor. In fact, she had criticized him so severely that I had been obliged to speak in his defense. I now found myself in a most doleful quandary, and there was only one thing of which I could be certain—I needed cooling toward Mildred if I still allowed myself to hope to marry Janet.

One afternoon I was talking to Mr. Bronce in his library, when, glancing toward the table used by his daughter for writing purposes, I was

astounded to see, lying on a little pile of letters, the Christmas shadrach. As soon as I could get an opportunity I took it in my hand and eagerly examined it. I had not been mistaken. It was the paper-weight I had given Mildred. There was the silver band around it, and there was the place where a little piece had been knocked off by the doctor. Mildred was not at home, but I determined that I would wait and see her. I would dine with the Bronces; I would spend the evening; I would stay all night; I would not leave the house until I had had this mystery explained. She returned in about half an hour and greeted me in the somewhat stiff manner she had adopted of late; but when she noticed my perturbed expression and saw that I held the shadrach in my hand, she took a seat by the table, where for some time I had been waiting for her, alone.

"I suppose you want to ask me about that paper-weight," she remarked.

"Indeed I do," I replied. "How in the world did you happen to get it again?"

"Again?" she repeated satirically. "You may well say that. I will explain it to you. Some little time ago I called on Janet Clinton, and on her writing-desk I saw that paper-weight. I remembered it perfectly. It was the one you gave me last Christmas and afterward borrowed of me, saying that you wanted to analyze it, or something of the sort. I had never used it very much, and of course was willing that you should take it, and make experiments with it if you wanted to, but I must say that the sight of it on Janet Clinton's desk both shocked and angered me. I asked her where she got it, and she told me a gentleman had given it to her. I did not need to waste any words in inquiring who this gentleman was, but I determined that she should not rest under a mistake in regard to its proper ownership, and told her plainly that the person who had given it to her had previously given it to me; that it was mine, and he had no right to give it to any one else. 'Oh, if that is the case,' she exclaimed, 'take it, I beg of you. I don't care for it, and, what is more, I don't care any more for the man who gave it to me than I do for the thing itself.' So I took it and brought it home with me. Now you know how I happened to have it again."

For a moment I made no answer. Then I asked her how long it had been since she had received the shadrach from Janet Clinton.

"Oh, I don't remember exactly," she said; "it was several weeks ago."

Now I knew everything; all the mysteries of the past were revealed to me. The young doctor, fervid in his desire to please the woman he loved, had given Janet this novel paper-weight. From that moment she had begun to

regard his attentions with apathy, and finally—her nature was one which was apt to go to extremes—to dislike him. Mildred repossessed herself of the shadrach, which she took, not as a gift from Janet, but as her rightful property, presented to her by me. And this horrid little object, probably with renewed power, had cooled, almost frozen indeed, the sentiments of that dear girl toward me. Then, too, had the spell been taken from Janet's inclinations, and she had gone to the rhododendron hills with Dr. Gilbert.

One thing was certain. I must have that shadrach.

"Mildred," I exclaimed, "will you not give me this paper-weight? Give it to me for my own?"

"What do you want to do with it?" she asked sarcastically. "Analyze it again?"

"Mildred," said I, "I did not give it to Janet. I gave it to Dr. Gilbert, and he must have given it to her. I know I had no right to give it away at all, but I did not believe that you would care; but now I beg that you will let me have it. Let me have it for my own. I assure you solemnly I will never give it away. It has caused trouble enough already."

"I don't exactly understand what you mean by trouble," she said, "but take it if you want it. You are perfectly welcome." And picking up her gloves and hat from the table she left me.

As I walked home my hatred of the wretched piece of metal in my hand increased with every step. I looked at it with disgust when I went to bed that night, and when my glance lighted upon it the next morning I involuntarily shrank from it, as if it had been an evil thing. Over and over again that day I asked myself why I should keep in my possession something which would make my regard for Mildred grow less and less; which would eventually make me care for her not at all? The very thought of not caring for Mildred sent a pang through my heart.

My feelings all prompted me to rid myself of what I looked upon as a calamitous talisman, but my reason interfered. If I still wished to marry Janet it was my duty to welcome indifference to Mildred.

In this mood I went out, to stroll, to think, to decide; and that I might be ready to act on my decision I put the shadrach into my pocket. Without exactly intending it I walked toward the Bronze place, and soon found myself on the edge of a pretty pond which lay at the foot of the garden. Here, in the shade of a tree, there stood a bench, and on this lay a book, an ivory paper-cutter in its leaves as marker.

I knew that Mildred had left that book on the bench; it was her habit to come to this

place to read. As she had not taken the volume with her, it was probable that she intended soon to return. But then the sad thought came to me that if she saw me there she would not return. I picked up the book; I read the pages she had been reading. As I read I felt that I could think the very thoughts that she thought as she read. I was seized with a yearning to be with her, to read with her, to think with her. Never had my soul gone out to Mildred as at that moment, and yet, heavily dangling in my pocket, I carried—I could not bear to think of it. Seized by a sudden impulse, I put down the book; I drew out the shadrach, and, tearing off the silver band, I tossed the vile bit of metal into the pond.

"There!" I cried. "Go out of my possession, out of my sight! You shall work no charm on me. Let nature take its course, and let things happen as they may." Then, relieved from the weight on my heart and the weight in my pocket, I went home.

Nature did take its course, and in less than a fortnight from that day the engagement of Janet and Dr. Gilbert was announced. I had done nothing to prevent this, and the news did not disturb my peace of mind; but my relations with Mildred very much disturbed it. I had hoped that, released from the baleful influence of the shadrach, her friendly feelings toward me would return, and my passion for her had now grown so strong that I waited and watched, as a wrecked mariner waits and watches for the sight of a sail, for a sign that she had so far softened toward me that I might dare to speak to her of my love. But no such sign appeared.

I now seldom visited the Bronze house; no one of that family, once my best friends, seemed to care to see me. Evidently Mildred's feelings toward me had extended themselves to the rest of the household. This was not surprising, for her family had long been accustomed to think as Mildred thought.

One day I met Mr. Bronze at the post-office, and, some other gentlemen coming up, we began to talk of a proposed plan to introduce a system of water-works into the village, an improvement much desired by many of us.

"So far as I am concerned," said Mr. Bronze, "I am not now in need of anything of the sort. Since I set up my steam-pump I have supplied my house from the pond at the end of my garden with all the water we can possibly want for every purpose."

"Do you mean," asked one of the gentlemen, "that you get your drinking-water in that way?"

"Certainly," replied Mr. Bronze. "The basin of the pond is kept as clean and in as good order as any reservoir can be, and the water

comes from an excellent, rapid-flowing spring. I want nothing better."

A chill ran through me as I listened. The shadrach was in that pond. Every drop of water which Mildred drank, which touched her, was influenced by that demoniacal paper-weight, which, without knowing what I was doing, I had thus bestowed upon the whole Bronze family.

When I went home I made diligent search for a stone which might be about the size and weight of the shadrach, and having repaired to a retired spot I practised tossing it as I had tossed the bit of metal into the pond. In each instance I measured the distance which I had thrown the stone, and was at last enabled to make a very fair estimate of the distance to which I had thrown the shadrach when I had buried it under the waters of the pond.

That night there was a half-moon, and between eleven and twelve o'clock, when everybody in our village might be supposed to be in bed and asleep, I made my way over the fields to the back of the Bronze place, taking with me a long fish-cord with a knot in it, showing the average distance to which I had thrown the practice stone. When I reached the pond I stood as nearly as possible in the place by the bench from which I had hurled the shadrach, and to this spot I pegged one end of the cord. I was attired in an old tennis suit, and, having removed my shoes and stockings, I entered the water, holding the roll of cord in my hand. This I slowly unwound as I advanced toward the middle of the pond, and when I reached the knot I stopped, with the water above my waist.

I had found the bottom of the pond very smooth, and free from weeds and mud, and I now began feeling about with my bare feet, as I moved from side to side, describing a small arc; but I discovered nothing more than an occasional pebble no larger than a walnut.

Letting out some more of the cord, I advanced a little farther into the center of the pond, and slowly described another arc. The water was now nearly up to my armpits, but it was not cold, though if it had been I do not think I should have minded it in the ardor of my search. Suddenly I put my foot on something hard and as big as my fist, but in an instant it moved away from under my foot; it must have been a turtle. This occurrence made me shiver a little, but I did not swerve from my purpose, and, loosing the string a little more, I went farther into the pond. The water was now nearly up to my chin, and there was something weird, mystical, and awe-inspiring in standing thus in the depths of this silent water, my eyes so near its gently rippling surface, fantastically lighted by the setting moon, and

tenanted by nobody knew what cold and slippery creatures. But from side to side I slowly moved, reaching out with my feet in every direction, hoping to touch the thing for which I sought.

Suddenly I set my right foot upon something hard and irregular. Nervously I felt it with my toes. I patted it with my bare sole. It was as big as the shadrach! It felt like the shadrach. In a few moments I was almost convinced that the direful paper-weight was beneath my foot.

Closing my eyes, and holding my breath, I stooped down into the water, and groped on the bottom with my hands. In some way I had moved while stooping, and at first I could find nothing. A sensation of dread came over me as I felt myself in the midst of the dark solemn water,—around me, above me, everywhere,—almost suffocated, and apparently deserted even by the shadrach. But just as I felt that I could hold my breath no longer my fingers touched the thing that had been under my foot, and, clutching it, I rose and thrust my head out of the water. I could do nothing until I had taken two or three long breaths; then, holding up the object in my hand to the light of the expiring moon, I saw that it was like the shadrach; so like, indeed, that I felt that it must be it.

Turning, I made my way out of the water as rapidly as possible, and, dropping on my knees on the ground, I tremblingly lighted the lantern which I had left on the bench, and turned its light on the thing I had found. There must be no mistake; if this was not the shadrach I would go in again. But there was no necessity for reëntering the pond; it *was* the shadrach.

With the extinguished lantern in one hand and the lump of mineral evil in the other, I hurried home. My wet clothes were sticky and chilly in the night air. Several times in my haste I stumbled over clods and briers, and my shoes, which I had not taken time to tie, flopped up and down as I ran. But I cared for none of these discomforts; the shadrach was in my power.

Crossing a wide field I heard, not far away, the tramping of hoofs, as of a horseman approaching at full speed. I stopped and looked in the direction of the sound. My eyes had now become so accustomed to the dim light that I could distinguish objects somewhat plainly, and I quickly perceived that the animal that was galloping toward me was a bull. I well knew what bull it was; this was Squire Starling's pasture-field, and that was his great Alderney bull, Ramping Sir John of Ramapo II.

I was well acquainted with that bull, renowned throughout the neighborhood for his savage temper and his noble pedigree—son of

Ramping Sir John of Ramapo I., whose sire was the Great Rodolphin, son of Prince Maximus of Granby, one of whose daughters averaged eighteen pounds of butter a week, and who, himself, had killed two men.

The bull, who had not perceived me when I crossed the field before, for I had then made my way with as little noise as possible, was now bent on punishing my intrusion upon his domains, and bellowed as he came on. I was in a position of great danger. With my flopping shoes it was impossible to escape by flight; I must stand and defend myself. I turned and faced the furious creature, who was not twenty feet distant, and then, with all my strength, I hurled the shadrach, which I held in my right hand, directly at his shaggy forehead. My ability to project a missile was considerable, for I had held, with credit, the position of pitcher in a base-ball nine, and as the shadrach struck the bull's head with a great thud he stopped as if he had suddenly run against a wall.

I do not know that actual and violent contact with the physical organism of a recipient accelerates the influence of a shadrach upon the mental organism of said recipient, but I do know that the contact of my projectile with that bull's skull instantly cooled the animal's fury. For a few moments he stood and looked at me, and then his interest in me as a man and trespasser appeared to fade away, and, moving slowly from me, Ramping Sir John of Ramapo II. began to crop the grass.

I did not stop to look for the shadrach; I considered it safely disposed of. So long as Squire Starling used that field for a pasture connoisseurs in mineral fragments would not be apt to wander through it, and when it should be plowed, the shadrach, to ordinary eyes no more than a common stone, would be buried beneath the sod. I awoke the next morning refreshed and happy, and none the worse for my wet walk.

"Now," I said to myself, "nature shall truly have her own way. If the uncanny comes into my life and that of those I love, it shall not be brought in by me."

About a week after this I dined with the Bronze family. They were very cordial, and it seemed to me the most natural thing in the world to be sitting at their table. After dinner Mildred and I walked together in the garden. It was a charming evening, and we sat down on the bench by the edge of the pond. I spoke to her of some passages in the book I had once seen there.

"Oh, have you read that?" she asked with interest.

"I have seen only two pages of it," I said, "and those I read in the volume you left on this bench, with a paper-cutter in it for a

marker. I long to read more and talk with you of what I have read."

"Why, then, did n't you wait? You might have known that I would come back."

I did not tell her that I knew that because I was there she would not have come. But before I left the bench I discovered that hereafter, wherever I might be, she was willing to come and to stay.

EARLY in the next spring Mildred and I were married, and on our wedding-trip we passed through a mining district in the mountains. Here we visited one of the great iron-works, and were both much interested in witnessing the wonderful power of man, air, and fire over the stubborn king of metals.

"What is this substance?" asked Mildred

of one of the officials who was conducting us through the works.

"That," said the man, "is what we call shad—"

"My dear," I cried, "we must hurry away this instant or we shall lose the train. Come; quick; there is not a moment for delay." And with a word of thanks to the guide I seized her hand and led her, almost running, into the open air.

Mildred was amazed.

"Never before," she exclaimed, "have I seen you in such a hurry. I thought the train we decided to take did not leave for at least an hour."

"I have changed my mind," I said, "and think it will be a great deal better for us to take the one which leaves in ten minutes."

Frank R. Stockton.

THE MIDNIGHT CALL.

THE night had settled down
On the roofs of the little town
In its mountain-hollow asleep.
There was neither color nor sound
Between the sky and the ground
Wrapped in that shadow deep.

The poplars stood up black,
With the sunless west at the back,
And the spectral river below;
And the staring hollyhock-heads
Had lost their blues and reds
In a straight and somber row.

Till over the hills remote,
With a splendor the dark that smote,
Suddenly rose the moon;
And a strange and ghostly light
In a moment filled the night,
Like the wraith of an autumn noon.

The scarlet leaves gleamed out
On the gray boughs all about,
Like a low and flickering flame:
Out of their trance of death
Color and sound, in a breath,
To valley and hillside came.

For the clamor of fife and drum
Startled the echoes dumb
To the march of a wandering band
That down through the shadows went,
Crying, "Repent! Repent!"
The day of the Lord is at hand!"

In time to the moving feet,
Through the quiet village street
The strains rang on before,
Till the ever-waxing din
Wakened the sleepers within
To gaze from window and door.

There was hurrying up and down,
And a stir through all the town,
A stir of doubt and fear,
As they heard, at the dead of night,
In the mystical, cold moonlight,
The day of the Lord is near.

But the pastor, bent and gray
With the burden of many a day,
Through the growing tumult broke
With solemn voice and word,
"Each day is the day of the Lord!"
To the startled throng he spoke.

"Harken, my people," said he.
"Why fear ye this band to see
That goeth with shout and song?
All days of our mortal breath,
Whether for life or for death,
To the God who gave belong.

Let a life of praise and prayer
For that awful hour prepare
Which cometh unknown to each!
Who knoweth that hour, O men?
Each day is the Lord's!" again
He cried, with reverent speech.

Slowly they bowed the head
To the words their pastor said,
While the sobbing and tumult died.
Out of the shadows black
Women and men went back,
Silently, side by side.

And the shouts and the trumpet-blast
Of the dim procession passed
Through the valley and over the hill;
Till again, in the quiet night,
'Neath the mystical, cold moonlight,
The sleeping town lay still.

Kate Putnam Osgood.

THE NAULAHKA.¹

A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

IV.

THE president engaged rooms at the hotel beside the railroad track at Topaz, and stayed over the next day. Tarvin and Sheriff took possession of him, and showed him the town and what they called its "natural resources." Tarvin caused the president to hold rein when he had ridden with him to a point outside the town, and discoursed, in the midst of the open plain and in the face of the snow-capped mountains, on the reasonableness and necessity of making Topaz the end of a division for the new railroad, and putting the division superintendent, the workshops, and the roundhouse here.

In his heart he knew the president to be absolutely opposed to bringing the railroad to Topaz at all; but he preferred to assume the minor point. It was much easier, as a matter of fact, to show that Topaz ought to be made a junction, and the end of a division, than it was to show that it ought to be a station on the Three C.'s. If it was anything, it would have to be a junction; the difficulty was to prove that it ought to be anything.

Tarvin knew the whole Topaz situation forward and back, as he might have known the multiplication table. He was not president of the board of trade and the head of a land and improvement company, organized with a capital of a million on a cash basis of \$2000, for nothing. Tarvin's company included all the solid men of the town; it owned the open plain from Topaz to the foothills, and had laid it out in streets, avenues, and public parks. One could see the whole thing on a map hung in the company's office on Connecticut Avenue, which was furnished in oak, floored with mosaic, carpeted with Turkish rugs, and draped with silk. There one could buy town lots at any point within two miles of the town; there, in fact, Tarvin had some town lots to sell. The habit of having them to sell had taught him the worst and the best that could be said about the place; and he knew to an exactitude all that he could make a given man believe about it.

He was aware, for example, that Rustler not only had richer mines in its near neighborhood than Topaz, but that it tapped a mining country behind it of unexplored and fabulous wealth; and he knew that the president knew it. He was equally familiar with other facts — as, for example, that the mines about Topaz were fairly good, though nothing remarkable in a region of great mineral wealth; and that, although the town lay in a wide and well-irrigated valley, and in the midst of an excellent cattle country, these were limited advantages, and easily matched elsewhere. In other words, the natural resources of Topaz constituted no such claim for it as a "great railroad center" as he would have liked any one to suppose who heard him talk.

But he was not talking to himself. His private word to himself was that Topaz was created to be a railroad town, and the way to create it was to *make* it a railroad town. This proposition, which could not have been squared to any system of logic, proceeded on the soundest system of reasoning — as thus: Topaz was not an existence at all; Topaz was a hope. Very well. And when one wished to make such hopes realities in the West, what did one do? Why, get some one else to believe in them, of course. Topaz was valueless without the Three C.'s. Then what was its value to the Three C.'s? Obviously the value that the Three C.'s would give it.

Tarvin's pledge to the president amounted to this, that if he would give them the chance, they would be worthy of it; and he contended that, in essence, that was all that any town could say. The point for the president to judge was, which place would be most likely to be worthy of such an opportunity, Topaz or Rustler; and he claimed there could be no question about that. When you came to size it up, he said, it was the character of the inhabitants that counted. They were dead at Rustler — dead and buried. Everybody knew that; there was no trade, no industry, no life, no energy, no money there. And look at Topaz! The president could see the character of her citizens at a glance as he walked the streets. They were wide awake down here. They meant business. They believed in their town, and they were ready to put their money on her. The presi-

dent had only to say what he expected of them. And then he broached to him his plan for getting one of the Denver smelters to establish a huge branch at Topaz; he said that he had an agreement with one of them in his pocket, conditioned solely on the Three C.'s coming their way. The company could n't make any such arrangement with Rustler; he knew that. Rustler had n't the flux, for one thing. The smelter people had come up from Denver at the expense of Topaz, and had proved Topaz's allegation that Rustler could n't find a proper flux for smelting its ore nearer to her own borders than fifteen miles—in other words, she could n't find it this side of Topaz.

Tarvin went on to say that what Topaz wanted was an outlet for her products to the Gulf of Mexico, and the Three C.'s was the road to furnish it. The president had, perhaps, listened to such statements before, for the entire and crystalline impudence of this drew no retort from his stolidity. He seemed to consider it as he considered the other representations made to him, without hearing it. A railroad president, weighing the advantages of rival towns, could not find it within his conception of dignity to ask which of the natural products of Topaz sought relief through the Gulf. But if Mutrie could have asked such a question, Tarvin would have answered unblushingly, "Rustler's." He implied this freely in the suggestion which he made immediately in the form of a concession. Of course, he said, if the road wanted to tap the mineral wealth of the country behind Rustler it would be a simple matter to run a branch road up there, and bring down the ore to be smelted at Topaz. Rustler had a value to the road as a mining center; he did n't pretend to dispute that. But a mineral road would bring down all the ore as well as a main line, make the same traffic for the road, and satisfy all proper claims of Rustler to consideration, while leaving the junction where it belonged by virtue of natural position.

He boldly asked the president how he expected to get up steam and speed for the climb over the Pass if he made Rustler the end of the division, and changed engines there. The place was already in the mountains; as a practical railroad-man the president must know that his engines could get no start from Rustler. The heavy grade by which the railroad would have to get out of the place, beginning in the town itself, prohibited the idea of making it the end of a division. If his engines, by good luck, were n't stalled on the grade, what did he think of the annual expense involved in driving heavy trains daily at a high mountain from the vantage-ground of a steep slope? What the Three C.'s wanted for the end of their division and their last stop before the climb

over the Pass was a place like Topaz, designed for them by nature, built in the center of a plain, which the railroad could traverse at a level for five miles before attacking the hills.

This point Tarvin made with the fervor and relief born of dealing with one solid and irrefragable fact. It was really his best argument, and he saw that it had reached the president as the latter took up his reins silently and led the way back to town. But another glance at Mutrie's face told him that he had failed hopelessly in his main contention. The certainty of this would have been heart-breaking if he had not expected to fail. Success lay elsewhere; but before trying that he had determined to use every other means.

Tarvin's eye rested lovingly on his town as they turned their horses again toward the cluster of dwellings scattered irregularly in the midst of the wide valley. She might be sure that he would see her through.

Of course the Topaz of his affections melted in and out of the Topaz of fact by shadings and subtleties which no measurement could record. The relation of the real Topaz to Tarvin's Topaz, or to the Topaz of any good citizen of the place, was a matter which no friendly observer could wish to press. In Tarvin's own case it was impossible to say where actual belief stopped and willingness to believe went on. What he knew was that he did believe; and with him the best possible reason for faith in Topaz would have been that it needed to be believed in hard. The need would have been only another reason for liking it.

To the ordered Eastern eye the city would have seemed a raw, untidy, lonely collection of ragged wooden buildings sprawling over a level plain. But this was only another proof that one can see only what one brings to the seeing. It was not so that Tarvin saw it; and he would not have thanked the Easterner who should have taken refuge in praise of his snow-whitened hills, walling the valley in a monstrous circle. The Easterner might keep his idea that Topaz merely blotted a beautiful picture; to Tarvin the picture was Topaz's scenery, and the scenery only an incident of Topaz. It was one of her natural advantages—her own, like her climate, her altitude, and her board of trade.

He named the big mountains to the president as they rode; he showed him where their big irrigating-ditch led the water down out of the heights, and where it was brought along under the shadow of the foothills before it started across the plain toward Topaz; he told him the number of patients, in their hospital, decently subduing his sense of their numerousness, as a testimony to the prosperity of the town; and as they rode into the streets he pointed

out the opera-house, the post-office, the public school, and the court-house, with the modesty a mother summons who shows her first-born.

It was at least as much to avoid thinking as to exploit the merits of Topaz that he spared the president nothing. Through all his advocacy another voice had made itself heard, and now, in the sense of momentary failure, the bitterness of another failure caught him with a fresh twinge; for since his return he had seen Kate, and knew that nothing short of a miracle would prevent her from starting for India within three days. In contempt of the man who was making this possible, and in anger and desperation, he had spoken at last directly to Sheriff, appealing to him by all he held most dear to stop this wickedness. But there are limp rags which no buckram can stiffen; and Sheriff, willing as he was to oblige, could not take strength into his fibre from the outside, though Tarvin offered him all of his. His talk with Kate, supplemented by this barren interview with her father, had given him a sickening sense of powerlessness from which nothing but a large success in another direction could rescue him. He thirsted for success, and it had done him good to attack the president, even with the foreknowledge that he must fail with him.

He could forget Kate's existence while he fought for Topaz, but he remembered it with a pang as he parted from Mutrie. He had her promise to make one of the party he was taking to the Hot Springs that afternoon; if it had not been for that he could almost have found it in his heart to let Topaz take care of herself for the remainder of the president's stay. As it was, he looked forward to the visit to the Springs as a last opening to hope. He meant to make a final appeal; he meant to have it out with Kate, for he could not believe in defeat, and he could not think that she would go.

The excursion to the Hot Springs was designed to show the president and Mrs. Mutrie what a future Topaz must have as a winter resort, if all other advantages failed her; and they had agreed to go with the party which Tarvin had hastily got together. With a view to a little quiet talk with Kate, he had invited three men besides Sheriff—Maxim, the postmaster; Heckler, the editor of the "Topaz Telegram" (both his colleagues on the board of trade); and a pleasant young Englishman named Carmathan. He expected them to do some of the talking to the president, and to give him half an hour with Kate, without detriment to Mutrie's impressions of Topaz. It had occurred to him that the president might be ready by this time for a fresh view of the town, and Heckler was the man to give it to him.

Carmathan had come to Topaz two years before in his capacity of colonizing younger

son, to engage in the cattle business, equipped with a riding-crop, top-boots, and \$2000 in money. He had lost the money; but he knew now that riding-crops were not used in punching cattle, and he was at the moment using this knowledge, together with other information gathered on the same subject, in the calling of cowboy on a neighboring range. He was getting \$30 a month, and was accepting his luck with the philosophy which comes to the adoptive as well as to the native-born citizens of the West. Kate liked him for the pride and pluck which did not allow him the easy remedy of writing home, and for other things; and for the first half of their ride to the Hot Springs they rode side by side, while Tarvin made Mr. and Mrs. Mutrie look up at the rocky heights between which they began to pass. He showed them the mines burrowing into the face of the rock far aloft, and explained the geological formation with the purely practical learning of a man who buys and sellsmine. The road, which ran alongside the track of the railroad already going through Topaz, wandered back and forth over it from time to time, as Tarvin said, at the exact angle which the Three C.'s would be choosing later. Once a train labored past them, tugging up the heavy grade that led to the town. The narrowing gorge was the first closing in of the hills, which, after widening again, gathered in the great cliffs of the cañon twenty miles below, to face each other across the chasm. The sweep of pictured rock above their heads lifted itself into strange, gnarled crags, or dipped suddenly and swam on high in straining peaks; but for the most part it was sheer wall—blue and brown and purplish-red umber, ocher, and the soft hues between.

Tarvin dropped back, and ranged his horse beside Kate's. Carmathan, with whom he was in friendly relation, gave place to him instantly, and rode forward to join the others in advance.

She lifted her speaking eyes as he drew rein beside her, and begged him silently to save them both the continuance of a hopeless contest; but Tarvin's jaw was set, and he would not have listened to an angel's voice.

"I tire you by talking of this thing, Kate. I know it. But I've got to talk of it. I've got to save you."

"Don't try any more, Nick," she answered gently. "Please don't. It's my salvation to go. It is the one thing I want to do. It seems to me sometimes, when I think of it, that it was perhaps the thing I was sent into the world to do. We are all sent into the world to do something, don't you think so, Nick, even if it's ever so tiny and humble and no account? I've got to do it, Nick. Make it easy for me."

"I'll be—hammered if I will! I'll make it hard. That's what I'm here for. Every

one else yields to that vicious little will of yours. Your father and mother let you do what you like. They don't begin to know what you are running your precious head into. I can't replace it. Can you? That makes me positive. It also makes me ugly."

Kate laughed.

"It does make you ugly, Nick. But I don't mind. I think I like it that you should care. If I could stay at home for any one, I'd do it for you. Believe that, won't you?"

"Oh, I'll believe, and thank you into the bargain. But what good will it do me? I don't want belief. I want you."

"I know, Nick. I know. But India wants me more—or not me, but what I can do, and what women like me can do. There's a cry from Macedonia, 'Come over and help us!' While I hear that cry I can find no pleasure in any other good. I could be your wife, Nick. That's easy. But with that in my ears I should be in torture every moment."

"That's rough on me," suggested Tarvin, glancing ruefully at the cliffs above them.

"Oh, no. It has nothing to do with you."

"Yes," returned he, shutting his lips; "that's just it."

She could not help smiling a little again at his face.

"I will never marry any one else, if it helps you any to know that, Nick," she said, with a sudden tenderness in her voice.

"But you won't marry me?"

"No," she said quietly, firmly, simply.

He meditated this answer a moment in bitterness. They were riding at a walk, and he let the reins drop on his pony's neck as he said, "Oh, well. Don't matter about me. It is n't all selfishness, dear. I *do* want you to stay for my own sake, I want you for my very own, I want you always beside me, I want you—want you; but it is n't for that I ask you to stay. It's because I can't think of you throwing yourself into the dangers and horrors of that life alone, unprotected, a girl. I can't think of it and sleep nights. I dare n't think of it. The thing's monstrous. It's hideous. It's absurd. You won't do it!"

"I must not think of myself," she answered in a shaken voice. "I must think of *them*."

"But I must think of *you*. And you sha'n't bribe me, you sha'n't tempt me, to think of any one else. You take it all too hard. Dearest girl," he entreated, lowering his voice, "are you in charge of the misery of the earth? There is misery elsewhere, too, and pain. Can you stop it? You've got to live with the sound of the suffering of millions in your ears all your life, whatever you do. We're all in for that. We can't get away from it. We pay that price for daring to be happy for one little second."

"I know, I know. I'm not trying to save myself. I'm not trying to stifle the sound."

"No; but you are trying to stop it, and you can't. It's like trying to scoop up the ocean with a dipper. You can't do it. But you can spoil your life in trying; and if you've got a scheme by which you can come back and have a spoiled life over again, I know some one who has n't. O Kate, I don't ask anything for myself,—or, at least, I only ask everything,—but do think of that a moment sometimes when you are putting your arms around the earth, and trying to lift it up in your soft little hands—you are spoiling more lives than your own. Great Scott, Kate, if you are looking for some misery to set right, you need n't go off this road. Begin on me."

She shook her head sadly. "I must begin where I see my duty, Nick. I don't say that I shall make much impression on the dreadful sum of human trouble, and I don't say it is for everybody to do what I'm going to try to do; but it's right for me. I know that, and that's all any of us can know. Oh, to be sure that people are a little better—if *only* a little better—because you have lived," she exclaimed, the look of exaltation coming into her eyes; "to know that you have lessened by the slightest bit the sorrow and suffering that must go on all the same, would be good. Even you must feel that, Nick," she said, gently laying her hand on his arm as they rode.

Tarvin compressed his lips. "Oh, yes; I feel it," he said desperately.

"But you feel something else. So do I."

"Then feel it more. Feel it enough to trust yourself to me. I'll find a future for you. You shall bless everybody with your goodness. Do you think I should like you without it? And you shall begin by blessing me."

"I can't! I can't!" she cried in distress.

"You can't do anything else. You must come to me at last. Do you think I could live if I did n't think that? But I want to save you all that lies between. I don't want you to be driven into my arms, little girl. I want you to come—and come now."

For answer to this she only bowed her head on the sleeve of her riding-habit, and began to cry softly. Nick's fingers closed on the hand with which she nervously clutched the pommel of her saddle.

"You can't, dear?"

The brown head was shaken vehemently. Tarvin ground his teeth.

"All right; don't mind."

He took her yielding hand into his, speaking gently, as he would have spoken to a child in distress. In the silent moment that lengthened between them Tarvin gave it up—not Kate, not his love, not his changeless resolve

to have her for his own, but just the question of her going to India. She could go if she liked. There would be two of them.

When they reached the Hot Springs he took an immediate opportunity to engage the willing Mrs. Mutrie in talk, and to lead her aside, while Sheriff showed the president the water steaming out of the ground, the baths, and the proposed site of a giant hotel. Kate, willing to hide her red eyes from Mrs. Mutrie's sharp gaze, remained with her father.

When Tarvin had led the president's wife to the side of the stream that went plunging down past the Springs to find a tomb at last in the cañon below, he stopped short in the shelter of a clump of cottonwoods.

"Do you really want that necklace?" he asked her abruptly.

She laughed again, gurglingly, amusedly, this time, with the little air of spectacle which she could not help lending to all she did.

"Want it?" she repeated. "Of course I want it. I want the moon, too."

Tarvin laid a silencing hand upon her arm.

"You shall have this," he said positively.

She ceased laughing, and grew almost pale at his earnestness.

"What do you mean?" she asked quickly.

"It would please you? You would be glad of it?" he asked. "What would you do to get it?"

"Go back to Omaha on my hands and knees," she answered with equal earnestness. "Crawl to India."

"All right," returned Tarvin, vigorously. "That settles it. Listen! I want the three C.'s to come to Topaz. You want this. Can we trade?"

"But you can never —"

"No matter; I'll attend to my part. Can you do yours?"

"You mean —" she began.

"Yes," nodded her companion, decisively; "I do. Can you fix it?"

Tarvin, fiercely repressed and controlled, stood before her with clenched teeth, and hands that drove the nails into his palms, awaiting her answer.

She tilted her fair head on one side with deprecation, and regarded him out of the vanishing angle of one eye provocatively, with a lingering, tantalizing look of adequacy.

"I guess what I say to Jim goes," she said at last with a dreamy smile.

"Then it's a bargain?"

"Yes," she answered.

"Shake hands on it."

They joined hands. For a moment they stood confronted, penetrating each other's eyes.

"You'll really get it for me?"

"Yes."

"You won't go back on me?"

"No."

He pressed her hand so that she gave a little scream.

"Ouch! You hurt."

"All right," he said hoarsely, as he dropped her hand. "It's a trade. I start for India tomorrow."

v.

TARVIN stood on the platform of the station at Rawut Junction watching the dust cloud that followed the retreating Bombay mail. When it had disappeared the heated air above the stone ballast began its dance again, and he turned blinking to India.

It was amazingly simple to come fourteen thousand miles. He had lain still in a ship for a certain time, and then had transferred himself to stretch at full length, in his shirt-sleeves, on the leather-padded bunk of the train which had brought him from Calcutta to Rawut Junction. The journey was long only as it kept him from sight of Kate, and kept him filled with thought of her. But was this what he had come for — the yellow desolation of a Rajputana desert, and the pinched-off perspective of the track? Topaz was cosier when they had got the church, the saloon, the school, and three houses up; the loneliness made him shiver. He saw that they did not mean to do any more of it. It was a desolation which doubled desolateness, because it was left for done. It was final, intended, absolute. The grim solidity of the cut-stone station-house, the solid masonry of the empty platform, the mathematical exactitude of the station name-board looked for no future. No new railroad could help Rawut Junction. It had no ambition. It belonged to the Government. There was no green thing, no curved line, no promise of life that produces, within eyeshot of Rawut Junction. The mauve railroad-creeper on the station had been allowed to die from lack of attention.

Tarvin was saved from the more positive pangs of homesickness by a little healthy human rage. A single man, fat, brown, clothed in white gauze, and wearing a black velvet cap on his head, stepped out from the building. This station-master and permanent population of Rawut Junction accepted Tarvin as a feature of the landscape: he did not look at him. Tarvin began to sympathize with the South in the war of the rebellion.

"When does the next train leave for Rhatore?" he asked.

"There is no train," returned the man, pausing with precise deliberation between the words. He sent his speech abroad with an air of detachment, irresponsibly, like the phonograph.

"No train? Where's your time-table?"

Where 's your railroad guide? Where 's your Pathfinder?"

"No train at all of any kind whatever."

"Then what the devil are you here for?"

"Sir, I am the station-master of this station, and it is prohibited using profane language to employees of this company."

"Oh, are you? Is it? Well, see here, my friend—you station-master of the steep-edge of the jumping-off-place, if you want to save your life you will tell me how I get to Rhatore—quick!"

The man was silent.

"Well, what do I do, anyway?" shouted the West.

"What do I know?" answered the East.

Tarvin stared at the brown being in white, beginning at his patent-leather shoes, surmounted by openwork socks, out of which the calf of his leg bulged, and ending with the velvet smoking-cap on his head. The passionless regard of the Oriental, borrowed from the purple hills behind his station, made him wonder for one profane, faithless, and spiritless moment whether Topaz and Kate were worth all they were costing.

"Ticket, please," said the baboo.

The gloom darkened. This thing was here to take tickets, and would do it though men loved, and fought, and despaired and died at his feet.

"See here," cried Tarvin, "you shiny-toed fraud; you agate-eyed pillar of alabaster—" But he did not go on; speech failed in a shout of rage and despair. The desert swallowed all impartially; and the baboo, turning with awful quiet, drifted through the door of the station-house, and locked it behind him.

Tarvin whistled persuasively at the door with uplifted eyebrows, jingling an American quarter against a rupee in his pocket. The window of the ticket-office opened a little way, and the baboo showed an inch of impassive face.

"Speaking now in offeshal capacity, your honor can getting to Rhatore via country bullock-cart."

"Find me the bullock-cart," said Tarvin.

"Your honor granting commission on transaction?"

"Cert." It was the tone that conveyed the idea to the head under the smoking-cap.

The window was dropped. Afterward, but not too immediately afterward, a long-drawn howl made itself heard—the howl of a weary warlock invoking a dilatory ghost.

"O Moti! Moti! O-o-h!"

"Ah there, Moti!" murmured Tarvin, as he vaulted over the low stone wall, gripsack in hand, and stepped out through the ticket wicket into Rajputana. His habitual gaiety and confidence had returned with the prospect of motion.

Between himself and a purple circle of hills lay fifteen miles of profitless, rolling ground, jagged with laterite rocks, and studded with unthrifty trees—all given up to drought and dust, and all colorless as the sun-bleached locks of a child of the prairies. Very far away to the right the silver gleam of a salt lake showed, and a formless blue haze of heavier forest. Sombre, desolate, oppressive, withering under a brazen sun, it smote him with its likeness to his own prairies, and with its homesick unlikeness.

Apparently out of a crack in the earth—in fact, as he presently perceived, out of a spot where two waves of plain folded in upon each other and contained a village—came a pillar of dust, the heart of which was a bullock-cart. The distant whine of the wheels sharpened, as it drew near, to the full-bodied shriek that Tarvin knew when they put the brakes suddenly on a freight coming into Topaz on the down grade. But this was in no sense a freight. The wheels were sections of tree butts—square for the most part. Four unbarked poles bounded the corners of a flat body; the sides were made of netted rope of cocoanut fiber. Two bullocks, a little larger than Newfoundlands, smaller than Alderneys, drew a vehicle which might have contained the half of a horse's load.

The cart drew up at the station, and the bullocks, after contemplating Tarvin for a moment, lay down. Tarvin seated himself on his gripsack, rested his shaggy head in his hands, and expended himself in mirth.

"Sail in," he instructed the baboo; "make your bargain. I'm in no hurry."

Then began a scene of declamation and riot to which a quarrel in a Leadville gambling saloon was a poor matter. The impassiveness of the station-master deserted him like a wind-blown garment. He harangued, gesticulated, and cursed; and the driver, naked except for a blue loin-cloth, was nothing behind him. They pointed at Tarvin; they seemed to be arguing over his birth and ancestry; for all he knew they were appraising his weight. When they seemed to be on the brink of an amicable solution, the question re-opened itself, and they went back to the beginning, and reclassified him and the journey.

Tarvin applauded both parties, sicking one on the other impartially for the first ten minutes. Then he besought them to stop, and when they would not he discovered that it was hot, and swore at them.

The driver had for the moment exhausted himself when the baboo turned suddenly on Tarvin, and, clutching him by the arm, cried, almost shouting, "All arrange, sir! all arrange! This man *most* uneducated man, sir. You giving me the money, I arrange everything."

Swift as thought, the driver had caught his

other arm, and was imploring him in a strange tongue not to listen to his opponent. As Tarvin stepped back they followed him with uplifted hands of entreaty and representation, the station-master forgetting his English, and the driver his respect for the white man. Tarvin, eluding them both, pitched his gripsack into the bullock-cart, bounded in himself, and shouted the one Indian word he knew. It happened, fortunately, to be the word that moves all India—"Challo!" which, being interpreted, is "Go on!"

So, leaving strife and desolation behind him, rode out into the desert of Rajputana Nicholas Tarvin of Topaz, Colorado.

VI.

UNDER certain conditions four days can dwarf eternity. Tarvin had found these circumstances in the bullock-cart from which he crawled ninety-six hours after the bullocks had got up from the dust at Rawut Junction. They stretched behind him—those hours—in a maddening, creaking, dusty, deliberate procession. In an hour the bullock-cart went two and a half miles. Fortunes had been made and lost in Topaz—happy Topaz!—while the cart plowed its way across a red-hot river-bed shut in between two walls of belted sand. New cities might have risen in the West and fallen to ruins older than Thebes while, after any of their meals by the wayside, the driver droned over a water-pipe something less wieldy than a Gatling-gun. In these waits and in others—it seemed to him that the journey was chiefly made up of waits—Tarvin saw himself distanced in the race of life by every male citizen of the United States, and groaned with the consciousness that he could never overtake them, or make up this lost time.

Great gray cranes with scarlet heads stalked through the high grass of the swamps in the pockets of the hills. The snipe and the quail hardly troubled themselves to move from beneath the noses of the bullocks, and once in the dawn, lying upon a glistening rock, he saw two young panthers playing together like kittens.

A few miles from Rawut Junction his driver had taken from underneath the cart a sword, which he hung around his neck, and sometimes used on the bullocks as a goad. Tarvin saw that every man went armed in this country, as in his own. But three feet of clumsy steel struck him as a poor substitute for the delicate and nimble revolver.

Once he stood up in the cart and hallooed, for he thought he saw the white top of a prairie schooner. But it was only a gigantic cotton-wain, drawn by sixteen bullocks, dipping and

plunging across the ridges. Through all, the scorching Indian sun blazed down on him, making him wonder how he had ever dared praise the perpetual sunshine of Colorado. At dawn the rocks glittered like diamonds, and at noonday the sands of the rivers troubled his eyes with a million flashing sparks. At eventide a cold, dry wind would spring up, and the hills lying along the horizon took a hundred colors under the light of the sunset. Then Tarvin realized the meaning of "the glorious East," for the hills were turned to heaps of ruby and amethyst, while between them the mists in the valleys were opal. He lay in the bullock-cart on his back and stared at the sky, dreaming of the Naulahka, and wondering whether it would match the scenery.

"The clouds know what I'm up to. It's a good omen," he said to himself.

He cherished the definite and simple plan of buying the Naulahka and paying for it in good money to be raised at Topaz by bonding the town—not, of course, ostensibly for any such purpose. Topaz was good for it, he believed, and if the Maharajah wanted too steep a price when they came to talk business he would form a syndicate.

As the cart swayed from side to side, bumping his head, he wondered where Kate was. She might, under favorable conditions, be in Bombay by this time. That much he knew from careful consideration of her route; but a girl alone could not pass from hemisphere to hemisphere as swiftly as an unfettered man spurred by love of herself and of Topaz. Perhaps she was resting for a little time with the Zenana Mission at Bombay. He refused absolutely to admit to himself that she had fallen ill by the way. She was resting, receiving her orders, absorbing a few of the wonders of the strange lands he had contemptuously thrust behind him in his eastward flight; but in a few days at most she ought to be at Rhatore, whither the bullock-cart was taking him.

He smiled and smacked his lips with pure enjoyment as he thought of their meeting, and amused himself with fancies about her fancies touching his present whereabouts.

He had left Topaz for San Francisco by the night train over the Pass a little more than twenty-four hours after his conference with Mrs. Mutrie, saying good-by to no one, and telling nobody where he was going. Kate perhaps wondered at the fervor of his "Good evening" when he left her at her father's house on their return from their ride to the Hot Springs. But she said nothing, and Tarvin contrived by an effort to take himself off without giving himself away. He had made a quiet sale of a block of town lots the next day at a sacrifice, to furnish himself with money for the

voyage; but this was too much in the way of his ordinary business to excite comment, and he was finally able to gaze down at the winking lights of Topaz in the valley from the rear platform of his train, as it climbed up over the Continental Divide, with the certainty that the town he was going to India to bless and boom was not "on to" his beneficent scheme. To make sure that the right story went back to the town, he told the conductor of the train, in strict confidence, while he smoked his usual cigar with him, about a little placer-mining scheme in Alaska which he was going there to nurse for a while.

The conductor embarrassed him for a moment by asking what he was going to do about his election meanwhile; but Tarvin was ready for him here too. He said that he had that fixed. He had to let him into another scheme to show him how it was fixed, but as he bound him to secrecy again, this did not matter.

He wondered now, however, whether that scheme had worked, and whether Mrs. Mutrie would keep her promise to cable the result of the election to him at Rhatore. It was amusing to have to trust a woman to let him know whether he was a member of the Colorado legislature or not; but she was the only living person who knew his address, and as the idea had seemed to please her, in common with their whole "charming conspiracy" (this was what she called it), Tarvin had been content.

When he had become convinced that his eyes would never again be blessed with the sight of a white man, or his ears with the sound of intelligible speech, the cart rolled through a gorge between two hills, and stopped before the counterpart of the station at Rawut Junction. It was a double cube of red sandstone, but—for this Tarvin could have taken it in his arms—it was full of white men. They were undressed excessively; they were lying in the veranda in long chairs, and between each chair was a well-worn bullock trunk.

Tarvin got himself out of the cart, unfolding his long stiffened legs with difficulty, and unkinking his muscles one by one. He was a mask of dust—dust beyond sand-storms or cyclones. It had obliterated the creases of his clothing and turned his black American four-button cutaway to a pearly white. It had done away with the distinction between the hem of his trousers and the top of his shoes. It dropped off him and rolled up from him as he moved. His fervent "Thank God!" was extinguished in a dusty cough. He stepped into the veranda, rubbing his smarting eyes.

"Good evening, gentlemen," he said. "Got anything to drink?"

No one rose, but somebody shouted for the servant. A man dressed in thin Tussur silk,

yellow and ill-fitting as the shuck on a dried cob, and absolutely colorless as to his face, nodded to him and asked languidly:

"Who are you for?"

"No? Have they got them here too?" said Tarvin to himself, recognizing in that brief question the universal shibboleth of the commercial traveler.

He went down the long line and twisted each hand in pure joy and thankfulness before he began to draw comparisons between the East and the West, and to ask himself if these idle, silent lotus-eaters could belong to the profession with which he had swapped stories, commodities, and political opinions this many a year in smoking-cars and hotel offices. Certainly they were debased and spiritless parodies of the alert, aggressive, joyous, brazen animals whom he knew as the drummers of the West. But perhaps—a twinge in his back reminded him—they had all reached this sink of desolation via country bullock-cart.

He thrust his nose into twelve inches of whisky and soda, and remained there till there was no more; then dropped into a vacant chair and surveyed the group again.

"Did some one ask who I was for? I'm for myself, I suppose, as much as any one—traveling for pleasure."

He had not time to enjoy the absurdity of this, for all five men burst into a shout of laughter, like the laughter of men who have long been estranged from mirth.

"Pleasure!" cried one. "O Lord!" "Pleasure! You've come to the wrong place."

"It's just as well you've come for pleasure. You'd be dead before you did business," said another.

"You might as well try to get blood out of a stone. I've been here over a fortnight."

"Great Scott! What for?" asked Tarvin.

"We've all been here over a week," growled a fourth.

"But what's your lay? What's your racket?"

"Guess you're an American, ain't you?"

"Yes; Topaz, Colorado." The statement had no effect upon them. He might as well have spoken in Greek. "But what's the trouble?"

"Why, the King married two wives yesterday. You can hear the gongs going in the city now. He's trying to equip a new regiment of cavalry for the service of the Indian Government, and he's quarreled with his Political Resident. I've been living at Colonel Nolan's door for three days. He says he can't do anything without authority from the supreme Government. I've tried to catch the King when he goes out pig-shooting. I write every day to the Prime Minister, when I'm not riding around the city

on a camel; and here 's a bunch of letters from the firm asking why I don't collect."

At the end of ten minutes Tarvin began to understand that these washed-out representatives of half a dozen firms in Calcutta and Bombay were hopelessly besieging this place on their regular spring campaign to collect a little on account from a king who ordered by the ton and paid by the scruple. He had purchased guns, dressing-cases, mirrors, mantelpiece ornaments, crochet-work, the iridescent Christmas-tree glass balls, saddlery, mail-phaëtons, four-in-hands, scent-bottles, surgical instruments, chandeliers, and chinaware by the dozen, gross, or score as his royal fancy prompted. When he lost interest in his purchases he lost interest in paying for them; and as few things amused his jaded fancy more than twenty minutes, it sometimes came to pass that the mere purchase was sufficient, and the costly packing-cases from Calcutta were never opened. The ordered peace of the Indian Empire forbade him to take up arms against his fellow sovereigns, the only lasting delight that he or his ancestors had known for thousands of years; but there remained a certain modified interest of war in battling with bill-collectors. On one side stood the Political Resident of the State, planted there to teach him good government, and, above all, economy; on the other side—that is to say, at the palace gates—might generally be found a commercial traveler, divided between his contempt of an evasive debtor and his English reverence for a king. Between these two his Majesty went forth to take his pleasure in pig-sticking, in racing, in the drilling of his army, in the ordering of more unnecessarys, and in the fitful government of his womankind, who knew considerably more of each commercial traveler's claims than even the Prime Minister. Behind these was the Government of India, explicitly refusing to guarantee payment of the King's debts, and from time to time sending him, on a blue velvet cushion, the jeweled insignia of an imperial order to sweeten the remonstrances of the Political Resident.

"Well, I hope you make the King pay for it," said Tarvin.

"How 's that?"

"Why, in my country, when a customer silies about like that, promising to meet a man one day at the hotel and not showing up and then promising to meet him the next day at the store and not paying, a drummer says to himself: 'Oh, all right. If you want to pay my board, and my wine, liquor, and cigar bill, while I wait, don't mind me. I'll mosey along somehow.' And after the second day he charges up his poker losings to him."

"Ah, that 's interesting. But how does he get those items into his account?"

"They go into the next bill of goods he sells him, of course. He makes the prices right for that."

"Oh, we can make prices right enough. The difficulty is to get your money."

"But I don't see how you fellows have the time to monkey around here at this rate," urged Tarvin, mystified. "Where I come from a man makes his trip on schedule time, and when he 's a day behind he 'll wire to his customer in the town ahead to come down to the station and meet him, and he 'll sell him a bill of goods while the train waits. He could sell him the earth while one of your bullock-carts went a mile. And as to getting your money, why don't you get out an attachment on the old sinner? In your places I 'd attach the whole country on him. I 'd attach the palace, I 'd attach his crown. I 'd get a judgment against him, and I 'd execute it too—personally, if necessary. I 'd lock the old fellow up and rule Rajputana for him, if I had to; but I 'd have his money."

A compassionate smile ran around the group. "That 's because you don't know," said several at once. Then they began to explain voluminously. There was no languor about them now; they all spoke together.

The men in the veranda, though they seemed idle, were no fools, Tarvin perceived after a time. Lying still as beggars at the gate of greatness was their method of doing business. It wasted time, but in the end some sort of payment was sure to be made, especially, explained the man in the yellow coat, if you could interest the Prime Minister in your needs, and through him wake the interests of the King's women.

A flicker of memory made Tarvin smile faintly as he thought of Mrs. Mutrie.

The man in the yellow coat went on, and Tarvin learned that the head queen was a murderess, convicted of poisoning her former husband. She had lain crouching in an iron cage awaiting execution when the King first saw her, and the King had demanded whether she would poison him if he married her, so the tale ran. Assuredly, she replied, if he treated her as her late husband had treated her. Thereupon the King had married her, partly to please his fancy, mainly through sheer delight in her brutal answer.

This gipsy without lineage held in less than a year King and state under her feet—feet which women of the household sang spitefully were roughened with travel of shameful roads. She had borne the King one son, in whom all her pride and ambition centered, and, after his birth, she had applied herself with renewed energy to the maintenance of mastery in the state. The supreme Government, a thousand

miles away, knew that she was a force to be reckoned with, and had no love for her. The white-haired, soft-spoken Political Resident, Colonel Nolan, who lived in the pink house a bow-shot from the city gates, was often thwarted by her. Her latest victory was peculiarly humiliating to him, for she had discovered that a rock-hewn canal designed to supply the city with water in summer would pass through an orange-garden under her window, and had used her influence with the Maharajah against it. The Maharajah had thereupon caused it to be taken around by another way at an expense of a quarter of his year's revenue, and in the teeth of the almost tearful remonstrance of the Resident.

Sitabhai, the gipsy, behind her silken curtains, had both heard and seen this interview between the rajah and his Political, and had laughed.

Tarvin devoured all this eagerly. It fed his purpose; it was grist to his mill, even if it tumbled his whole plan of attack topsyturvy. It opened up a new world for which he had no measures and standards, and in which he must be frankly and constantly dependent on the inspiration of the next moment. He could n't know too much of this world before taking his first step toward the Naulahka, and he was willing to hear all that these lazy fellows would tell him. He began to feel as if he should have to go back and learn his A B C's over again. What pleased this strange being they called King? what appealed to him? what tickled him? above all, what did he fear?

He was thinking much and rapidly.

But he said, "No wonder your King is bankrupt if he has such a court to look after."

"He's one of the richest princes in India," returned the man in the yellow coat. "He does n't know himself what he has."

"Why does n't he pay his debts, then, instead of keeping you mooning about here?"

"Because he's a native. He'd spend a hundred thousand pounds on a marriage-feast, and delay payment of a bill for two hundred rupees four years."

"You ought to cure him of that," insisted Tarvin. "Send a sheriff after the crown jewels."

"You don't know Indian princes. They would pay a bill before they would let the crown jewels go. They are sacred. They are part of the government."

"Ah, I'd give something to see the Luck of the State!" exclaimed a voice from one of the chairs, which Tarvin afterward learned belonged to the agent of a Calcutta firm of jewelers.

"What's that?" he asked as casually as he knew how, sipping his whisky and soda.

"The Naulahka. Don't you know?"

Tarvin was saved the need of an answer by the man in yellow. "Pshaw! All that talk about the Naulahka is invented by the priests."

"I don't think so," returned the jeweler's agent, judicially. "The King told me when I was last here that he had once shown it to a viceroy. But he is the only foreigner who has ever seen it. The King assured me he did n't know where it was himself."

"Pooh! Do you believe in carved emeralds two inches square?" asked the other, turning to Tarvin.

"That's only the centerpiece," said the jeweler; "and I would n't mind wagering that it's a tallow-drop emerald. It is n't that that staggers me. My wonder is how these chaps, who don't care anything for water in a stone, could have taken the trouble to get together half a dozen perfect gems, much less fifty. They say that the necklace was begun when William the Conqueror came over."

"That gives them a year or two," said Tarvin. "I would undertake to get a little jewelry together myself if you gave me eight centuries."

His face was turned a little away from them as he lay back in his chair. His heart was going quickly. He had been through mining-trades, land-speculations, and cattle-deals in his time. He had known moments when the turn of a hair, the wrinkle of an eyelid, meant ruin to him. But they were not moments into which eight centuries were gathered.

They looked at him with a remote pity in their eyes.

"Five absolutely perfect specimens of the nine precious stones," began the jeweler; "the ruby, emerald, sapphire, diamond, opal, cat's-eye, turquoise, amethyst, and—"

"Topaz?" asked Tarvin, with the air of a proprietor.

"No; black diamond—black as night."

"But how do you know all these things; how do you get on to them?" asked Tarvin, curiously.

"Like everything else in a native state—common talk, but difficult to prove. Nobody can as much as guess where that necklace is."

"Probably under the foundations of some temple in the city," said the yellow-coated man.

Tarvin, in spite of the careful guard he was keeping over himself, could not help kindling at this. He saw himself digging the city up.

"Where is this city?" inquired he.

They pointed across the sun-glare, and showed him a rock girt by a triple line of wall. It was exactly like one of the many ruined cities that Tarvin had passed in the bullock-cart. A rock of a dull and angry red surmounted that

rock. Up to the foot of the rock ran the yellow sands of the actual desert — the desert that supports neither tree nor shrub, only the wild ass, and somewhere in its heart, men say, the wild camel.

Tarvin stared through the palpitating haze of heat, and saw that there was neither life nor motion about the city. It was a little after noonday, and his Majesty's subjects were asleep. This solid block of loneliness, then, was the visible end of his journey — the Jericho he had come from Topaz to attack.

And he reflected, "Now, if a man should come from New York in a bullock-cart to whistle around the Sanguache Range, I wonder what sort of fool I'd call him!"

He rose and stretched his dusty limbs. "What time does it get cool enough to take in the town?" he asked.

"Do *what* to the town? Better be careful. You might find yourself in difficulties with the Resident," warned his friendly adviser.

Tarvin could not understand why a stroll through the deadest town he had ever seen should be forbidden. But he held his peace, inasmuch as he was in a strange country where nothing, save a certain desire for command on the part of the women, was as he had known it. He would take in the town thoroughly. Otherwise he began to fear that its monumental sloth — there was still no sign of life upon the walled rock — would swallow him up, or turn him into a languid Calcutta drummer.

Something must be done at once before his wits were numbed. He inquired the way to the telegraph-office, half-doubting, even though he saw the wires, the existence of a telegraph in Rhatore.

"By the way," one of the men called after him, "it's worth remembering that any telegram you send here is handed all round the court and shown to the King."

Tarvin thanked him, and thought this *was* worth remembering, as he trudged on through the sand toward a desecrated Mohammedan mosque near the road to the city which was doing duty as a telegraph-office.

A trooper of the state was lying fast asleep on the threshold, his horse picketed to a long bamboo lance driven into the ground. Other sign of life there was none, save a few doves cooing sleepily in the darkness under the arch.

Tarvin gazed about him dispiritedly for the blue and white sign of the Western Union, or its analogue in this queer land. He saw that the telegraph-wires disappeared through a hole in the dome of the mosque. There were two or three low wooden doors under the archway. He opened one at random, and stepped upon a warm, hairy body, which sprang up with a grunt. Tarvin had hardly time to draw back

before a young buffalo calf rushed out. Undisturbed, he opened another door, disclosing a flight of steps eighteen inches wide. Up these he traveled with difficulty, hoping to catch the sound of the ticker. But the building was as silent as the tomb it had once been. He opened another door, and stumbled into a room, the domed ceiling of which was inlaid with fretted tracery in barbaric colors, picked out with myriads of tiny fragments of mirrors. The flood of color and the glare of the snow-white floor made him blink after the pitchy darkness of the staircase. Still, the place was undoubtedly a telegraph-office, for an antiquated instrument was clamped upon a cheap dressing-table. The sunlight streamed through the gash in the dome which had been made to admit the telegraph-wires, and which had not been repaired.

Tarvin stood in the sunlight and stared about him. He took off the soft, wide-brimmed Western hat, which he was finding too warm for this climate, and mopped his forehead. As he stood in the sunlight, straight, clean-limbed, and strong, one who lurked in this mysterious spot with designs upon him would have decided that he did not look a wholesome person to attack. He pulled at the long thin mustache which drooped at the corners of his mouth in a curve shaped by the habit of tugging at it in thought, and muttered picturesque remarks in a tongue to which these walls had never echoed. What chance was there of communicating with the United States of America from this abyss of oblivion? Even the "damn" that came back to him from the depths of the dome sounded foreign and inexpressive.

A sheeted figure lay on the floor. "It *takes* a dead man to run this place," exclaimed Tarvin, discovering the body. "Hallo, you! Get up there!"

The figure rose to its feet with grunts, cast away its covering, and disclosed a very sleepy native in a complete suit of dove-colored satin.

"Ho!" cried he.

"Yes," returned Tarvin, imperturbably.

"You want to see me?"

"No; I want to send a telegram, if there's any electric fluid in this old tomb."

"Sir," said the native, affably, "you have come to right shop. I am telegraph-operator and postmaster-general of this state."

He seated himself in the decayed chair, opened a drawer of the table, and began to search for something.

"What you looking for, young man? Lost your connection with Calcutta?"

"Most gentlemen bring their own forms," he said with a distant note of reproach in his bland manner. "But here is form. Have you got pencil?"

"Oh, see here, don't let me strain this office.

Had n't you better go and lie down again? I'll tap the message off myself. What's your signal for Calcutta?"

"You, sir, not understanding this instrument."

"Don't I? You ought to see me milk the wires at election-time."

"This instrument require most judeecious handling, sir. You write message. I send. That is proper division of labor. Ha, ha!"

Tarvin wrote his message, which ran thus:

"Getting there. Remember Three C's.

TARVIN."

It was addressed to Mrs. Mutrie at the address she had given him in Denver.

"Rush it," he said, as he handed it back over the table to the smiling image.

"All right; no fear. I am here for that," returned the native, understanding in general terms from the cabalistic word that his customer was in haste.

"Will the thing ever get there?" drawled Tarvin, as he leaned over the table and met the gaze of the satin-clothed being with an air of good comradeship, which invited him to let him into the fraud, if there was one.

"Oh, yes; to-morrow. Denver is in the United States America," said the native, looking up at Tarvin with childish glee in the sense of knowledge.

"Shake!" exclaimed Tarvin, offering him a hairy fist. "You've been well brought up."

He stayed half an hour fraternizing with the man on the foundation of this common ground of knowledge, and saw him work the message

off on his instrument, his heart going out on that first click all the way home. In the midst of the conversation the native suddenly dived into the cluttered drawer of the dressing-table, and drew forth a telegram covered with dust, which he offered to Tarvin's scrutiny.

"You knowing any new Englishman coming to Rhatore name Turpin?" he asked.

Tarvin stared at the address a moment, and then tore open the envelop to find, as he expected, that it was for him. It was from Mrs. Mutrie, congratulating him on his election to the Colorado legislature by a majority of 1518 over Sheriff.

Tarvin uttered an abandoned howl of joy, executed a war-dance on the white floor of the mosque, snatched the astounded operator from behind his table, and whirled him away into a mad waltz. Then, making a low salaam to the now wholly bewildered native, he rushed from the building, waving his cable in the air, and went capering up the road.

When he was back at the rest-house again he retired to a bath to grapple seriously with the dust of the desert, while the commercial travelers without discussed his comings and goings. He plunged about luxuriously in a gigantic bowl of earthenware, while a brown-skinned water-carrier sluiced the contents of a goat-skin over his head.

A voice in the veranda, a little louder than the others, said, "He's probably come prospecting for gold or boring for oil, and won't tell."

Tarvin winked a wet left eye.

(To be continued.)

QUEEN ELIZABETH.

DO you know Queen Elizabeth?
"Elizabeth! Why, she is dust.
Her evil eyes and haughty brow
Have perished, as we mortals must,
Long years ago. Why ask me now
With such a tender, bated breath
If I know Queen Elizabeth?"

No, no! But Saint Elizabeth,
That sacred Queen of Hungary,
She for whose saving it befell
When man would work her misery
The good God worked a miracle,
And into roses turned her bread.
"Vain questioner, she too is dead."

You call her dead? Elizabeth!
Perhaps; but yet she is alive.
I know her, noble, sweet, serene.
Ah, yes; for such as she survive.
They wear another garb and mien,
But when the years come round and round
Again and yet again they're crowned.

I know her well—Elizabeth.
Still are her hands heaped full of bread,
Still is her heart a mighty sea
Of lavish love, and still are sped
Her thoughts to endless charity.
No king forbids her. No priest saith,
"Love not!" to my Elizabeth.

She liveth silent in her shrine,
Her royal robe becomes her well,

And royally her dark eyes shine
The regal soul within to tell.
But good! What saint of ancient lore
Hath done what she does o'er and o'er?

She carries in her gracious hands
Cheer to the lonely and the sad;
She breaks away those heavy bands
That bind the wretched; she is glad,
As God is glad, to bend and show
New hope and help to them below.

I know who hath anointed her
Above her fellows, who hath sent
This regent to administer
His gifts and goodness, who hath lent
To earth's forlorn surcease of faith
This living ray, Elizabeth.

I lay beside the edge of death,
My soul and body racked with pain,
Crying for God to take my breath
Into his wordless will again;
All other hope was lost and vain,
When suddenly the Master saith,
"I send to thee Elizabeth."

She came, she lifted up my chains,
She smiled and lit my dark despair;
With words as kind as summer rains
She took me in her queenly care,
She filled my bitten lips with prayer.
Were my tongue dry with dusts of death
I'd gasp, "God bless Elizabeth!"

Rose Terry Cooke.

THE RAPTURE OF HETTY.

THE dance was set for Christmas night at Walling's, a horse-ranch where there were women, situated in a high, watered valley, shut in by foothills, sixteen miles from the nearest town. The cabin with its roof of "shakes," the sheds and corrals, can be seen from any divide between Packer's ferry and the Payette.

The "boys" had been generally invited, with one exception to the usual company. The youngest of the sons of Basset, a pastoral and

nomadic house, was socially under a cloud, on the charge of having been "too handy with the frying-pan brand."

The charge could not be substantiated, but the boy's name had been roughly handled in those wide, loosely defined circles of the range, where the force of private judgment makes up for the weakness of the law in dealing with crimes that are difficult of detection and uncertain of punishment. He that has obliterated his neighbor's brand, or misapplied his own, is held as in the age of tribal government and ownership was held, the remover of his neighbor's landmarks. A word goes forth against

him potent as the Levitical curse, and all the people say amen.

As society's first public and pointed rejection of him, the slight had rankled with the son of Basset; and grievously it wore on him that Hetty Rhodes was going with the man who had been his earliest and most persistent accuser—Hetty, prettiest of all the bunch-grass belles, who never reproached nor quarreled, but judged people with her smile and let them go. He had not complained, though he had her promise,—one of her promises,—nor asked a hearing in his own defense. The sons of Basset were many and poor; their stock had dwindled upon the range; her men-folk condemned him, and Hetty believed, or seemed to believe, as the others.

Had she forgotten the night when two men's horses stood at her father's fence—the Basset boy's and his that was afterward his accuser, and the other's horse was unhitched when the evening was but half spent, and furiously ridden away, while the Basset boy's stood at the rails till close upon midnight? Had the coincidence escaped her that from this night, of one man's rage and another's bliss, the ugly charge had dated? Of these things a girl may not testify.

They met in town on the Saturday before the dance, Hetty buying her dancing-shoes at the back of the store, where the shoe-cases framed in a snug little alcove for the exhibition of a "fit," the boy, in his belled spurs and "chaps" of goat-hide, lounging disconsolate and sulky against one of the front counters. She wore a striped ulster—an enchanted garment his arm had pressed—and a pink crocheted Tam-o'-Shanter cocked bewitchingly over her dark eyes. Her hair was ruffled, her cheeks were red with the wind she had faced two hours on the spring-seat of her father's "dead ax" wagon. Critical feminine eyes might have found her a trifle blowzy; the sick-hearted Basset boy looked once—he dared not look again.

Hetty coquetted with her partner in the shoe-bargain, a curly-headed young Hebrew, who flattered her familiarly and talked as if he had known her from a child, but always with an eye to business. She stood, holding back her skirts and rocking her instep from right to left while she considered the effect of the new style—patent-leather foxings and tan-cloth tops, and heels that came under the middle of her foot, and narrow toes with-tips of stamped leather; but what a price! More than a third of her chicken-money gone for that one fancy's satisfaction. But who can know the joy of a really distinguished choice in shoe-leather as one that in her childhood has trotted barefoot through the sage-brush and associated shoes only with cold weather or going to town? The Basset boy tried to fix his strained attention

upon anything rather than upon that tone of high jocosity between Hetty and the shiny-haired clerk. He tried to summon his own self-respect and leave the place.

What was the tax, he inquired, on those neck-handkerchiefs, and he pointed with the loaded butt of his braided leather "quirt" to a row of dainty silk mufflers signaling custom from a cord stretched above the gentlemen's furnishing-counter.

The clerk explained that the goods in question were first class, all silk, brocaded, and of an extra size. Plainly he expected that a casual mention of the price would cool the inexperienced customer's curiosity, especially as the colors displayed in the handkerchiefs were not those commonly affected by the cowboy cult. The Basset boy threw down his last half-eagle and carelessly called for the one with a blue border. The delicate "baby blue" attracted him by its perishability, its suggestion of impossible refinements beyond the soilage and dust of his grimy circumstances. Yet he pocketed his purchase as though it were any common thing, not to show his pride in it before the patronizing salesman.

He waited foolishly for Hetty, not knowing if she would even speak to him. When she came at last loitering down the shop, with her eyes on the gay Christmas counters, her arms filled with bundles, he silently fell in behind her and followed her to her father's wagon, where he helped her unload her purchases.

"Been buying out the store?" he opened the conversation.

"Buying more than father 'll want to pay for," she drawled, glancing at him sweetly. Those entailing looks of Hetty's dark-lashed eyes had grown to a habit with her; even now the little Jewish salesman was smiling over his brief portion in them. Her own coolness made her careless, as children are, in playing with fire.

"Here 's some Christmas the old man won't have to pay for." A soft paper parcel was crushed into her hand.

"Who is going to pay for it I 'd like to know? If it 's some of your doings, Jim Basset, I can't take it—so there!"

She thrust the package back upon him. He tore off the wrapper and let the wind carry his rejected token into the trampled mud and slush of the street.

Hetty screamed, and pounced to the rescue. "What a shame! It 's a beauty of a handkerchief. It must have cost a lot of money. I sha'n't let you use it so."

She shook it, and wiped away the spots from its delicate sheen, and folded it into its folds again.

"I don't want the thing." He spurned it fiercely.

"Then give it to some one else." She endeavored coquettishly to force it into his hands or into the pockets of his coat. He could not withstand her thrilling little liberties in the face of all the street.

"I 'll wear it Monday night," said he. "Maybe you think I won't be there?" he added hoarsely, for he had noted her look of surprise mingled with an infuriating touch of pity. "You kin bank on it I 'll be there."

Hetty toyed with the thought that after all it might be better that she should not go to the dance. There might be trouble, for certainly Jim Basset had looked as if he meant it when he had said he would be there; and Hetty knew the temper of the company, the male portion of it, too well to doubt what their attitude would be toward an inhibited guest who disputed the popular verdict and claimed social privileges which, it had been agreed, he had forfeited. But it was never really in her mind to deny herself—at least the excitement. She and her escort were among the first couples to cross the snowy pastures stretching between her father's claim and the lights of the lonely horse-ranch.

It was a cloudy night, the air soft, chill, and springlike. Snow had fallen early and frozen upon the ground; the stockmen welcomed the "chinook wind" as the promise of a break in the hard weather. Shadows came out and played on the pale slopes as the riders rose and dropped past one long swell and another of dim country, falling away like a ghostly land seeking a ghostly sea. And often Hetty looked back, fearing yet half hoping that the interdicted one might be on his way, among the dusky, straggling shapes behind.

The company was not large, nor up to nine o'clock particularly merry. The women were engaged in cooking supper, or up in the roof-room brushing out their crimps by the light of an unshaded kerosene-lamp placed on the pine washstand which did duty as a dressing-table. The men's voices came jarringly through the loose boards of the floor from below.

About that hour came the unbidden guest, and like the others he had brought his "gun." He was stopped at the door and told that he could not come in among the girls to make trouble. He denied that he had come with any such intention. There were persons present—he mentioned no names—who were no more eligible, socially speaking, than himself, and he ranked himself low in saying so; where such as these could be admitted, he proposed to show that he could. He offered, in evidence of his good faith and peaceable intentions, to give up his gun; but on condition that he be allowed one dance with the partner of his choosing, regardless of her previous engagements.

This unprecedented proposal was referred to the girls, who were charmed with its audacity. But none of them spoke up for the outcast till Hetty said she could not think what they were all afraid of. A dozen to one, and that one without his weapon! Then the other girls chimed in, and added their timid suffrages. There may have been some twinges of disappointment, there could hardly have been surprise, when the black sheep directed his choice without a look elsewhere to Hetty. She stood up, smiling but rather pale, and he rushed her to the head of the room, securing the most conspicuous place before his rival, who with his partner took the place of second couple opposite.

"Keep right on!" the fiddler chanted, in sonorous cadence to the music, as the last figure of the set ended with "Promenade all!" He swung into the air of the first figure again, smiling, with his cheek upon his instrument and his eyes upon the floor. Hetty fancied that his smile meant more than merely the artist's pleasure in the joy he evokes.

"Keep your places!" he shouted again, after the "Promenade all!" a second time had raised the dust and made the lamps flare, and lighted with smiles of sympathy the rugged faces of the elders ranged against the walls. The side couples dropped off exhausted, but the tops held the floor, and neither of the men was smiling.

The whimsical fiddler invented new figures, which he "called off" in time to his music, to vary the monotony of a quadrille with two couples missing.

The opposite girl was laughing hysterically; she could no longer dance or stand. The rival gentleman looked about him for another partner. One girl jumped up, then, hesitating, sat down again. The music passed smoothly into a galop, and Hetty and her bad boy kept the floor, regardless of shouts and protests warning the trespasser that his time was up and the game in other hands.

Thrice they circled the room. They looked neither to right nor left; their eyes were upon each other. The men were all on their feet, the music playing madly. A group of half-scared girls were huddled, giggling and whispering, near the door of the dimly lighted shed-room. Into the midst of them Hetty's partner plunged with his breathless, smiling dancer in his arms, passed into the dim outer place to the door where his horse stood saddled, and they were gone.

They crossed the little valley known as Seven Pines, they crashed through the thin ice of the creek, they rode double sixteen miles before midnight—Hetty wrapped in her lover's "slicker," with the blue-bordered handkerchief, her only wedding-gift, tied over her blowing hair.

MOZART—AFTER A HUNDRED YEARS.

BY THE AUTHOR OF "THE WOMEN OF THE FRENCH SALONS."

THE changes of fashion are not limited to the cut of our clothes, the style of our houses, our manners, and our modes of living. We must have also new forms for our thoughts, new expressions for our emotions. The idols of one generation make way for the idols of the next—fortunate if a name carved in a stone or some faded memorial tells the world they have lived. It is only here and there that a commanding genius stands on a pinnacle so high that its divine light shines upon remote ages which point to it as a distinct landmark in its own sphere. And even these are not quite free from the inevitable caprices of taste. While we still burn incense at time-honored altars, we turn to new gods, and, fired with some fresh sensation, pronounce the old ones a little antiquated after all. It is the youngest of the arts that feels, perhaps, the most perceptibly these fluctuations. In this late nineteenth century we like our viands very much spiced, and music is the last expression of the complexity, the turmoil, the fever, the intensity of modern life. We no longer seek in it the repose that belonged to simpler conditions, a less artificial existence, but strain the nerves, the mind, the senses to scale some unknown heaven of thought and feeling; then falling back from this emotional delirium, we find nature tame, the old creations insipid, the masters of the past colorless. It is refreshing sometimes to step aside into a more serene atmosphere, to kneel once more before half-deserted shrines, to take refuge from the spirit of unrest, in the everlasting beauty, the inexhaustible charm of the poet-singers of a past generation.

It may seem like repeating an oft-told tale to retrace the incidents of a career so well known as that of Mozart, nor is it possible that any written or spoken words can ever add to the luster of his fame. The world has long since made up its mind about him, compiled its records, reared its monuments, and assigned him a place among its great ones. But it is well from time to time to rub off the dust that gathers upon old monuments and old records, and to scatter fresh flowers upon honored graves. It brings more vividly before us the

men who have toiled and suffered, the men who have claims upon our love and sympathy as well as upon our admiration—a love and sympathy doubly due to those whose lives were marred and broken. The genius that delights the world seldom brings happiness to its possessor, and it is idle to speak of it as its own compensation. It has doubtless its hours of supreme joy, but no mortal dwells permanently in the sunlit heights of thought or imagination, and those who best interpret the subtle secrets of the soul are those who are born the most responsive to the variations of the world about them.

Among all the sad tales of struggling and disappointed genius, I know of none so pathetic as that of Mozart. In the place of recalling cold historic facts, one is tempted to chant a perpetual miserere. A childhood of wonderful precocity, a youth of rare triumphs, a brief, neglected manhood, an unhonored death, and an immortal fame—it is the old story of the coral-insect that toils to build itself a magnificent tomb to charm the world it has shut itself out of.

The tragedy of Mozart's fate does not lie in the simple combat with adverse circumstances, which falls more or less to the average lot of humanity, but in the strange disproportion between the promise of life and its fulfilment. No one ever hoped so much and realized so little. Nature, which was so lavish of its gifts, forgot to add the worldly talent to reap their fruits. We do not know to what height he might have reached had he lived to the allotted age of man. Cut off in his prime, his genius seems to have touched the highest altitude, to have been singularly rounded and complete. Variations in power there may have been, but we discover no backward step, no symptom of decline. That he should have had so small a return is among the inscrutable mysteries of a world whose caprices no one can follow.

An artist of transcendent gifts, a composer without a peer in his day, and in natural spontaneity without a superior in any day, a man of sunny temper and pure aspirations, genial, confiding, generous, and tender, he stumbled over the hardest places and broke down midway in his career, partly because he was in advance of his age and the untrodden path was too rough for him, and partly be-

HOUSE IN WHICH MOZART WAS BORN, SALZBURG.
(DRAWN FROM A PHOTOGRAPH BY LUDWIG HARDTMUTH.)

cause he did not know how to deal with the simple, every-day facts of existence. The little boy whom queens petted and savants praised, who saw life open before him so brilliantly, and "loving all the world, fancied all the world loved him," toiled through dreary days of poverty and neglect, saddened and discouraged, but hoping still because it was his nature to hope, and centering in a few short years the work and the suffering of threescore and ten.

If one were to choose a birthplace for its natural beauty, no lovelier spot could be found than Salzburg. Set in the midst of a smiling plain, with the green and wooded heights of the Capuzinerberg rising from a rocky and precipitous base on one side, the dark and somber Mönchsberg bounding it like a granite wall on the other, and an amphitheater of mountains towering behind them in solemn and picturesque grandeur, it is an ideal home for a poet and an artist. The old fortress still frowns from the rock-bound summit of the Hohen-Salzburg, guarding the narrow defiles through which the Salzach rushes swiftly down from the snowy peaks, that sweep away into the heart of the Tyrolese Alps. Beyond these

lie the sunny slopes of Italy. In this valley, which takes a half-melancholy tone from its mysterious legends and its capricious skies, was born in 1756 the fourth of the illustrious quintet of German masters which marked the golden age of music, and was completed by Beethoven. Bach had been dead six years. Handel died three years later, and Haydn was just struggling into fame. The place and the period were favorable for the peculiar gifts of Mozart. He was no less fortunate in his early surroundings.

It has been rarely accorded to the children of song to be so happy in their childhood. There is a pathetic tale of Handel at seven years of age, practising upon a dumb spinet in a cold attic to be out of the hearing of a violent father. Haydn made his way through poverty by the force of his own will. The young Beethoven was lonely and neglected. But Mozart had a pleasant home; limited in fortune it always was, and the family was compelled to practice the strictest economy; but love was there, and hope, with which no household can be quite desolate.

The father, who had been educated for the law, but afterward devoted himself to music and became violinist, then kapellmeister at the court of Salzburg, was a shrewd, prudent, judicious man, of fine literary tastes and much refinement. Wise and tender, as well as profoundly versed

in his art, he seemed eminently fitted to mold the rich, pliant, spontaneous nature of his precocious son. His wife was a woman of great beauty and simple domestic tastes. In youth they were considered the handsomest couple in Salzburg. Only Wolfgang and the Nannerl, to whom he refers so often, survived out of a large family. To the training of these two gifted children the life of Leopold Mozart was devoted. "Next to God comes papa" was one of the son's childish sayings, and he never went to bed without kissing him on the tip of the nose after singing a little evening hymn of his own composition. He used to say that when his father was old he would put him in a glass case, that he might keep him always near and out of the dust. How touchingly the father refers to these happy days in the letters of after years! One can fancy a tear in his eye as he wrote them.

Every one is familiar with the marvelous stories of Mozart's childhood. We have been often told how the little boy of three years stood by the piano while his sister took her lesson, and astonished his father at its close by searching among the keys for a few moments with his baby fingers, then playing the exercise neatly

and correctly; how a year later he amused himself with writing minuets, and attempted a concerto which was free from errors, but so difficult that no one could play it; how he always insisted on carrying about his toys to the sound of music; how he covered the floor, the chairs, and the walls with figures in a fit of absorbing passion for mathematics—a talent which showed itself later in the remarkable precision with which musical ideas arranged themselves in his head, to be written down at a moment's notice. The exquisite delicacy of organization that made him shudder and turn pale at the sound of a trumpet, the fine ear that could detect the variation of an eighth of a tone in a

measured at less than his value, and the sad experience of his maturity was doubly hard when the wonted stimulus was withdrawn.

At six years of age the small, fair-haired child, with a delicate face and large expressive eyes, simple and gifted, loving and lovable, is the pet and delight of the greatest courts in Europe. But he is not at all dazzled by royal grandeur. Maria Theresa is only a kind and tender woman to him. He climbs into her lap and kisses her with an impulsive affection that touches her heart, while she smiles at his boldness and caresses him as any other woman would have done. He slips on the waxed floor, and the little Marie Antoinette helps him to

MOZART'S DWELLING IN SALZBURG.

violin from one day to another, the extreme susceptibility that could not bear a cold word from those he loved without tears—these were more or less essential parts of the outfit which nature bestows upon a musical artist. To a child so sensitive, so loving, so tremulously alive to the changing moods of those around him, an atmosphere of fostering warmth was a necessity. It left him free from the wear and tear of the emotions, and saved him from the morbid introspection that has darkened the lives of so many men of genius upon whom the world has pressed too heavily in their first years.

It was perhaps Mozart's misfortune to come before the world as an infant prodigy. Though his genius never suffered the deterioration which is the too frequent fate of precocity, the undue tension and excitement of his childhood inevitably consumed much of the physical vigor needed for prolonged and continuous effort. The wine of life was exhausted in the beginning. He received, too, the best the world had to give in praise and adulation. As the novelty wore off and he ceased to be a wonder he was

rise, upon which he promptly says, "You are good and I will marry you." Had she forgotten this childish incident when he was working and waiting so hopelessly for a ray of encouragement during those dark days in Paris? He tells the young prince that he plays out of tune, the same one who, as the Emperor Joseph II., might have assured him a fortune but did not. Fine words and cheering promises were about all the unfortunate composer ever received from the sovereign he loved and trusted to the end. Mozart had a vein of irrepressible humor, and we have an amusing picture of the boy in the gold-bordered lilac suit and moiré vest which the empress sent him, resplendent with his powdered curls, his bright knee-buckles, and his little sword, marching pompously about the room, in imitation of the dignified courtiers who had frowned upon his free sallies of wit. But the swift intuitions of the child go straight to the heart of things, and the approval of a simple man of science is worth more to him than the wondering applause of courts. As he sat down at the piano, he asked for Wagenseil and said to him, "I am going to play one of

your concertos; will you turn the leaves for me?"

He is petted also in the salons of Paris, at Versailles, and at the English court. He plays at sight the most difficult works of Handel, is equally master of the organ and piano, impro-

vises with exquisite taste and the science of a kapellmeister, writes the base to given melodies without an instrument, and composes six sonatas for Queen Charlotte, whom he also accompanies with ease in the unfamiliar arias she sings for him. And he is not yet seven years old! The critical pen of Grimm grows eloquent in his praise. Gifts and caresses are showered upon him, and he finds himself altogether in a very rose-colored, happy world. This tour of more than three years, in which his sister, also a brilliant pianist, shared his successes, was a series of triumphs which might have turned an older head, but the little Wolfgang seems to have lost none of his childlike simplicity.

After a few more years of study his vision was still further deepened and broadened by a visit to Italy. He was then fourteen and was received with distinguished honors, being elected a member of the Academy of Bologna after a severe examination, and decorated by the Pope with the order of the Golden Spur. In spite of the excitement of seeing new places and new things, he writes motets and symphonies, composes the opera of "Mithridates," which he conducts with success at Milan, dashes off minuets and bits of dance-music for his friends, dallies with mathematics and the French classics, and studies with care the exquisite art of the Italian singers, as well as the theories and methods of the masters. He dines with Jomelli, whose operas he thinks too intricate and too antiquated for the stage, makes a lifelong friend of the learned Padre Martini, is pleasantly received

by the famous Farinelli, and praised by the "divine Hasse," who says, "This child will make us all forgotten." His letters to his mother and sister give us rapid sketches of his life at this time. They are an odd *mélange* in several languages, lively and dramatic, full of sparkling conceits and quaint comments upon men and things, mingled with affectionate inquiries after those he left at home; here a word of consolation to a sick friend for whom he has offered prayers in the cathedral, and there a message to the canary that sings in G sharp, or a kiss for "Miss Bimberl," his favorite dog. He is always running over with love and humor, but occasional light touches of mature criticism reveal a vein of serious thought, and give us swift glimpses of the treasures hidden in his young head. This side of his nature, however, usually finds vent in music, which conveys to the world so little of all there is behind it.

At Rome he accomplished the feat of copying Allegri's celebrated "Miserere" after a *single hearing*. This "Miserere" was a traditional heritage of the Sistine Chapel, and it was forbidden to copy it, under pain of excommunication. One can imagine the exaltation of the fine-souled boy hearing for the first time this sorrow-laden music, with the far-seeing eyes of Michelangelo's prophets and sibyls looking down from the vaults above, and the terrors of the "Last Judgment" before him, heightened by the deepening gloom as one after another the lights went out and the low chant filled the brooding darkness like a voice from the invisible world. "How I felt then! How I felt then!" he exclaimed long afterward in relating this memorable experience. A lesser genius would have been lost in the rush of overpowering emotions; and it is a striking proof of the remarkable balance between his sympathetic and artistic nature that he could carry away every note of the complicated music, to be put down on paper in his room, subject to a few trifling corrections on a second hearing.

One is always tempted to linger upon the childhood of Mozart. It was by far the happiest period of his life, the one in which his greatest personal triumphs were centered, the one in which his genius met the most cordial recognition. The severity of his studies was tempered by perpetual contact with the most distinguished artists of his time, while his observation of the great world, his intercourse with critical minds, and his familiarity with a wide range of musical tastes naturally counteracted all tendency toward a provincial accent.

But there was a reverse side to his early successes, which began to assume alarming prominence on his return to Salzburg. Musicians

there were little better than upper servants. Strictly speaking, their position was worse. The servants were fitted to their surroundings, and moved naturally among them, while artists of delicacy and education were cramped and humiliated. It must be said, too, that the Salzburg musicians were not as a rule of a character to please the Mozarts. It may be readily imagined that the young Wolfgang, fresh from a larger and more refined world, did not take kindly to these associations. "I detest everything that belongs to Salzburg," he said, "at least everything that is native here. The tone and manners of the people are insupportable to me." The new archbishop was a hard, tyrannical man, who made life still less tolerable to him. But places were the gift of courts, and independence of spirit was a quality few could afford. The elder Mozart had worn the fetters of practically forced servitude all his life, and felt that it was better to buy advancement at the cost of a few twinges of wounded pride than to starve in helpless freedom. His advice is always marked by worldly prudence, and there is, perhaps, a trace of servility in it. But this little weakness can be readily forgiven when we remember how much he did for the world by his untiring devotion to his son, and how poorly it repaid him in a lonely, disappointed age, doomed to a dire struggle with poverty even to the end, which brought him rest about four years earlier than it did his illustrious son.

It is to escape these humiliations and the irksome duties of a narrow sphere, in which, according to one of his biographers, he had worked five years for a trifle over a pound a year, that Mozart starts at twenty-one on the tour which is to leave such marked traces upon his genius as well as his destiny. His mother goes with him, while his father and sister are left alone by the desolate fireside.

HAD Mozart found the life of a court musician in a small German principality a little less hard, the world might have had another Palestrina, or perhaps another Bach, but it is not likely it would ever have known the Mozart it loves and reveres to-day. To understand the incalculable importance of his final visit to Paris from an artistic point of view, one must recall the musical conditions when he entered upon the scene. Nearly a century and a half had elapsed since a few Florentine dilettanti and composers, catching the echo of the Renaissance, had tried to revive the musical declamation of the Greeks, by introducing into the opera, recitatives which faithfully expressed the sentiment of the words. Their influence upon Italian music was slight and their names are mostly forgotten, except by the student who seeks them upon some remote

page of history. The opera was ruled by the singers, and these cared mainly to display the range and quality of their voices, while the indolent and pleasure-loving people of the south, wishing to be amused with the least effort, found the traditional arias strung upon a light dramatic thread most in accord with their taste and temperament. But, transferred to French and German soil, this germ of theory has developed by a series of evolutions into the magnificent musical drama of to-day. The two names which stand out most prominently in this dramatic reaction are Gluck and Mozart. The foundation of the richness of orchestration, which forms one of its chief features, was laid in the dim organ-lofts of Germany, where for

MOZART AT NINE YEARS OF AGE.
(FROM A PAINTING IN POSSESSION OF A. SANLLICH.)

more than a hundred years threadbare organists had been delving in the mysteries of counterpart and harmony—men who lived mostly in their own "palace of sounds," and died unknown, until one day Bach and Handel came before the world with their grand results. Bach was content to work all his life in his modest place for love of his art and a scant pittance, to go on weaving his incomparable harmonies until they were merged in the eternal harmony. But the web so "simple and subtle" was a web of gold on whose priceless treasures successive generations of artists have been nurtured. Handel wrote for thirty years according to the Ital-

MOZART, HIS FATHER AND SISTER—ALSO PORTRAIT OF HIS MOTHER. (FROM A PAINTING BY JOHANN NEPOMUK DE LA CROCE, IN THE MOZART MUSEUM.)

ian traditions, because he wrote for a world whose tastes had been molded upon them and because he must do so to live. When his colossal genius at last broke its fetters and he refused longer to subject his art to the vanity of singers or the caprice of fashion, the conflict began which has been waging ever since under slightly altered names and conditions. Handel and Buononcini divided London into parties as hostile as were the partizans of Gluck and Piccini in Paris a few years later. The classic and romantic schools which are merged in the Wagnerian and anti-Wagnerian factions of to-day have lost none of the old antagonism, though the point of divergence has moved along the changes of a century, and the iconoclasts of the past have become the conservative rallying-points of the present. The luminous point of perfection in all art that is reached but once and beyond which the divine ideal is lost in its mortal draperies—where does it lie? To-day asks this of yesterday, but to-morrow only can answer.

It was through the influence of Handel that Gluck, at fifty, changed his methods and worked out the theory that placed him at the head of the musical dramatists of his time, and made him the chief of a new school. It was Mozart's

mission to give permanent vitality to this school, and practically to found the national opera of Germany. That which Gluck had reached by long experience and carefully studied formulas Mozart grasped at once by the pure force of his native genius, and applied in his own way. What Gluck did for his generation Mozart transformed, expanded, and vitalized for all time. With the warmth and intensity of the south, tempered by the dreamy imagination of the north, he carried within himself the elements of dramatic power; but it was the circumstances of his life that led to their full development. The influence of Italy was still supreme in music, and he had been reared with Italian models always before him, though he had been familiar from infancy with Handel and other German masters. To a consummate gift of melody he added all the resources of science. He had perfectly mastered the language of his art, which was indeed his native language, and before reaching maturity had already tried his hand with more or less brilliant success upon every form of music. But thus far he had followed the old paths. Two things were yet needed to give his genius its final, distinctive, and original stamp—a deeper experience of life and a practical insight into the

possibilities of the lyric drama. The first was gained rapidly in the dark paths of adversity, and a fate that often shapes our ends more wisely than we know opened to him the last.

There is something inexpressibly pathetic in this tour of the young artist, of whom it had been said that monarchs would one day dispute the possession. He had always lived in a world of dreams and harmonies, free from care for the morrow. Now, for the first time, he finds himself adrift with no sage adviser to direct his steps. The education which had ripened his genius so rapidly began to cast its shadows over his life. His exemption from self-dependence to the years of manhood, the habit of being guided and protected that he might devote himself exclusively to the one end upon which the family counted so largely, were doubtless the source of irretrievable errors. Sheltered and petted as he had been, he naturally colored the world with the illusions of his own heart. At this point we begin to see that fatal defect of will, the "cloud no bigger than a man's hand," which gradually overspread the heavens until it blotted out the sun of his earthly existence. "My son," writes his anxious father, "in all your affairs you are hasty and headlong. Your whole character has changed. As a child you were rather serious than childish. Now, it seems to me, you are too quick to answer every one in a jesting way on the slightest provocation, and this is the first step toward familiarity which one must avoid in this world if he cares to be respected. It is your good heart's fault that you can see no defect in the person who pays you a clever compliment, that you take him into your confidence and give him your love."

True to these characteristics, we find Mozart perpetually turned aside from the end in view by the caprice of the moment. He lingers at Munich with a great deal of hope but very little encouragement, until his father, less trustful, bids him go on. At Augsburg he talks merry nonsense with his pretty cousin, lavishes gifts upon his friends, sends home sharp caricatures of the people he meets, asserts his independence with rather more spirit than discretion, but finds no prospect of a position. He fares little better at Mannheim. "They think because I am little and young that there can be nothing great and old in me," he writes. But he receives many pleasant words; meets the poet Wieland, of whom he makes a rapid but not altogether flattering pen-portrait; takes a violent prejudice against the learned Abbé Vogler, which he expresses rather too freely; gives a few lessons; and, finally, falling in love with Aloysia Weber, gravely proposes to his father to take her whole family to Italy for the sake of introducing this charming singer on the

Italian stage in an opera he wishes to write for her. His frank, generous nature leads him into a thousand wild schemes that are to benefit everybody but himself. He has no end of quixotic plans for his friends, and all must be happy in his Utopia. Genius is to be appreciated, and no one is to be poor or neglected. Blessed illusions of youth that keep always before the mind's eye the illuminated shadow of some happiness that is forever receding! But these visions are rudely dispelled by his father, who chides his long delay and sends him on to Paris. He leaves his heart behind him, and not in safe keeping, as the sequel proves.

It so happened that Mozart was led to the gay capital at the moment when the famous war between Gluck and Piccini was at its height, and Paris was divided into musical factions. Gluck was warmly supported by Marie Antoinette, and his battles were fought in the salons by Suard and the Abbé Arnould. Piccini had on his side the old traditions, the patronage of Madame Du Barry, the wit of the Abbé Morellet, and the influence of La Harpe. Marmontel wrote librettos for him, and Rousseau ardently defended him, until, charmed and fascinated, he went over to his rival. Society ranged itself under these opposite banners. "Iphigenia" and "Armida" were the topics of the hour, and, in spite of a powerful opposition, Gluck was the fashion. In the midst of this excitement the public had little time to bestow upon a new aspirant for honors, and the artist who, in the judgment of posterity, was destined to eclipse Gluck upon his own ground had great difficulty in finding a hearing. Grimm introduced him in a few salons, but the young man of twenty-one had a very different reception from the boy of seven. French society and French manners had no charms for him; French morality repelled him. He disliked Paris as thoroughly as Mendelssohn did half a century later. Both were too serious and too earnest in their art, too delicate and poetic in their genius to please the light-hearted Parisians. If the tone of the great world was distasteful to him, he liked the musicians no better. His good nature is imposed upon, he is deceived with false promises, refuses the position of organist at Versailles as too obscure, gives a few lessons, hopes, and is disappointed. But he is not idle. His eager mind quickly divined the value of the new methods, as well as the superiority of the French drama. He studied with care the works of Grétry and of Gluck, omitting no opportunity to make himself familiar with French masterpieces. To some one who asked him if the study of the Italians would not be more profitable, he replied, "In all that regards melody, yes, but for truth of diction and dramatic expression, no." Mozart was be-

MOZART'S SPINET, IN THE MOZART MUSEUM.

fore all things a musician, and believed that "poetry in the opera ought to be absolutely the obedient daughter of music." He never accepted the theory of Gluck that the true function of music was to "add to poetry what vivacity of color, the happy accord of light and shade, add to a correct and well-composed design." But with his dramatic genius, his fine artistic sense, and his perfect mastery of the art of musical expression, he reaches simply and naturally a point which Gluck had touched from an opposite direction—a point where "the poem seems not less made for the music than the music for the poem." In the midst of this life, so unsatisfactory in its immediate results but so fruitful for his genius, the plans of Mozart were suddenly changed by the death of his mother. Alone in a foreign city, without experience and without consolation, he meets his first great sorrow. One is struck with the delicacy, the tender consideration for his family, the profound religious faith, and the unlooked-for worldly wisdom called out by the grave responsibility so suddenly forced upon him. In these dark days he turns to the only friend he has, and is for a time domesticated in the household of Grimm and the kind-hearted Madame d'Epinau. But the great critic is an ardent supporter of Italian music, and the innovating theories of the young composer do not please him. His interest, which from the first has lacked the enthusiasm he gave to the wonderful child, begins decidedly to cool. "Your son is too confident," he writes to Leopold Mozart, "not sufficiently active, too easily

imposed upon, too little occupied with the means that might lead to fortune. In order to make one's way here it is necessary to be shrewd, enterprising, bold. For his success I should wish him half his talent and double his tact; then I should not be embarrassed."

An offer of the position of court organist at Salzburg with a salary of five hundred florins, accompanied by a peremptory command from his father, at last turned Mozart's reluctant steps homeward. But a fresh grief awaits him. A change of fortune has come to the Webers, and the young girl whose image he has cherished so tenderly during those sad and dreary months is singing with brilliant success at Munich. She has tasted the intoxicating sweets of flattery, and, with her broadening horizon, she looks with different eyes upon the youthful lover from whom she had parted a short time before with so many tears. The picture we have of Mozart at this time was not one to strike the ardent fancy of a romantic girl. Success had not yet thrown about him its illusive aureole, and there was nothing in his personal appearance to indicate his superiority. It suggested delicacy rather than strength. He was small and slender, with a pale, thin face, fair hair, a nose that in later life became too prominent, and large, full eyes, which were dreamy and abstracted unless he was animated by music, when his whole countenance, so remarkable for mobility, lighted with inspiration. His head was too large for his fragile body, and he was vain of his small hands and feet. The beauty of his childhood was gone, and he had not the dignity of a well-poised maturity. A few months had sufficed to wear off the glamour of first love, and the boyish artist, in the red coat with black buttons he wore in mourning for his mother, stood divested of all illusions before the critical eyes of the capricious singer of scarcely more than sixteen. "I knew nothing of the greatness of his genius, I saw in him only a little man," she said long afterward. Mozart was at no time greatly given to brooding; his temperament was too elastic to be long weighed down. He had the heart of a child, that sheds a few bitter tears over its griefs and lets them pass. This disappointment was wept over and apparently forgotten, though it doubtless left its shadow. His fickle charmer married the actor Lange, but was not happy, and finally left him; her relations with the composer, however, were always friendly, and he seems to have cherished no resentment—indeed he congratulated himself in Vienna that her husband's jealousy saved him from the danger of seeing too much of her. His affections were transferred to her younger, less brilliant, and more domestic sister, Constance.

Mozart returns from his first mature venture

no richer in money or prospects and far poorer in heart and faith. He has won his little meed of applause from those who might have helped him, and been dismissed with a paltry gift, a watch, perhaps, of which he had already a superfluity, a snuff-box, or money enough to pay for a dinner. The extravagant hopes, the ardent expectations with which he left his home have had no realization, and he finds himself once more in the narrow cage against the iron bars of which he is beating out his life. He is constantly called upon for musical trifles to amuse the court, as well as for religious compositions, but the little leisure he can snatch from his daily duties is devoted to the dramatic studies which always had such an absorbing fascination for him. The first fruit of his Paris experience was given to the world in "Idomeneo," which was brought out at Munich early in 1781. The subject was taken from Grecian history, a field in which Gluck had won his fame. It is regarded by critics as a compromise between Italian and French methods. Mozart's gift of melody did not blind him to the larger possibilities of musical expression, and there is no more striking proof of the grasp of a genius so marvelously fitted to catch the inspiration of passing events and to portray life on its familiar and purely human side than the facility with which he could give natural and perfect voice to the conceptions of a heroic age.

In the midst of his triumphs he is summoned to take his place in the suite of the archbishop, who has gone to Vienna for the festivities that followed the accession of Joseph II. to the throne. This is the final turning-point in his career. The long series of humiliations that made life so intolerable to him in Salzburg reach their climax. He is forced to dine with cooks and valets, refused permission to add to his scanty income by playing at private concerts, and expected to wait in the antechamber, to be always ready for his tyrannical master's bidding. "At half-past eleven we take our places at the table," he writes,— "the two *valets de chambre*, the *controleur*, the pastry-cook, the two under-cooks of his Greatness—and my Littleness. The *valets de chambre* have the places of honor; I have the privilege of coming before the under-cooks." At last he can bear it no longer, and in a fit of anger and despair at some fresh outrage he resigns his position.

"A most self-sufficient young man," the archbishop thinks him. The world gossips about him. His father chides him and loses faith in him; but neither advice nor entreaties avail in the least to change his resolution. "It is the heart that ennobles the man," he writes in a burst of rage at being treated like a menial. This is an echo of the sentiment that breaks from the lips of the peasant poet who is toiling

and despairing at the same time among the bare and somber hills of Scotland. These children of song were both doomed to a hopeless struggle with adverse fortune, haunted by poverty, stung by the insults of patronage, and wounded by neglect. Both asserted themselves with the pride of genius and the dignity of conscious manhood, but the spirit of the coming age had found its voice too soon. Burns had a more combative temper, a stronger and more intelligible weapon to turn against the world that frowned upon him, though the shafts of his satire glanced from an impenetrable surface, and only crushed him in the rebound. The tragedy of Mozart's life has not been so clearly outlined in his work. It has found expression only in music that speaks from soul to soul, but tells no definite tale of wrong or suffering. The genius of these men was unlike, and they differed widely in character as well as education, but there is a certain kinship in the spirit that underlies the pathetic ballads of the one and the great tone-poems of the other. It is the spirit of love and humor, the intense humanity, the irrepressible sympathy with all living things that has brought them so near to the heart of the world. Both were poet-singers, both were clear, simple, tender, natural, and true. Both, toil-worn and unfortunate, died early, and it

MOZART'S GRAND PIANO, IN THE MOZART MUSEUM.

was left for another generation to shed its tears and cast its laurels over their graves. Nowhere is the bitter irony of fate more striking than in the stately mausoleums and magnificent statues reared over the dust or built in memory of these immortal singers. "I asked for bread and ye gave me a stone."

ALONE in a strange city, with necessity staring him in the face, a nature unfitted for the

STATUE OF MOZART BY BARRIAS, IN THE LUXEMBOURG, PARIS.

practical details of life, and without any resource but his genius, which had already made him the target for jealousy and malice, Mozart started at twenty-five on the brief, sad career of his maturity. The Vienna of 1781 was the musical center of Germany. Gluck was enjoying there the prestige of his Parisian fame and his seventy years of toil and success. Haydn was quietly living in luxurious ease in the pleasant service of Prince Esterhazy. Salieri, the great Italian master, whose history is so closely interwoven with the

misfortunes of Mozart's later life, but whose glory has long since been lost in that of his rival and victim, was at the height of his popularity. Numerous lesser lights clustered around these stars, shining with a paler luster or illuminated with a few rays of borrowed glory. The Emperor Joseph was himself a musician, as well as connoisseur, and took pride in the aid and encouragement he gave to artists. In this atmosphere, through the aid of a few sympathetic friends, Mozart establishes himself with a small capital of everything but genius and hope. In these he is rich. A little praise, a few fair promises are ample foundations for the most glittering of air-castles. On the strength of an encouraging word he even proposes to his father and sister to come and live with him, as he is sure to have enough for all. How sad seem these happy delusions by the light of after events! His main dependence for a time was his skill as a virtuoso. His facility in arranging popular dance-music brought him a small revenue, to which he added by giving a few lessons; but to the latter he had an unconquerable aversion, and his pupils were never numerous. It may be that his marvelous flexibility and flow of melody were favored by the pressure that compelled him to throw off a great number of unconsidered trifles on the spur of the moment; but it is impossible to estimate how many rare and serious masterpieces the world has lost through this sad necessity. He was literally forced to a daily struggle for existence. The money he was to send home, alas! never goes. He has very little for himself.

It was at this juncture of affairs, and on the basis of the prospects opened to him by a command from the emperor to write an opera, that Mozart took, with characteristic inconsequence, the most serious step of his life. After leaving the archbishop's service, he had found a home with his old friends, the Webers, who were then living in Vienna; but gossip soon began to connect his name with that of the daughter Constance, and he changed his abode. He had already lost his heart, however, though he vainly tries to conceal the fact from his suspicious father. There is a peculiar naïveté in his manner of introducing the subject at last. He preludes his confession with a long catalogue of reasons why he ought to marry. One is that he has never been in the habit of taking care of his linen. He thinks a wife desirable also to save superfluous expenses, referring to Constance as a sort of martyr who has to bear all the burdens of the family, and

dwelling upon the advantage of having a wife who is not at all extravagant. He touches lightly upon her personal attractions, which seem to have consisted mainly in a pair of bright black eyes and a pretty figure. "She makes no pretension to talent," he writes, "but has all that is necessary for the duties of a wife and mother. Her habits are simple, and she does not seek a fine toilet. She knows how to fit and make all that she needs, dresses her own hair, understands the care of a household, and has the best heart in the world. In fine, I adore her, and she loves me with all her soul. Frankly, could I dream of a better wife?"

But his little romance did not run smoothly. Not only did his father positively refuse his consent to the marriage, but Constance met with great opposition from her own family. She finally took refuge with the Baroness Waldstetten, under whose protection they were married in the summer of 1782. This generous friend took it upon herself to pacify Mozart's father, and paid the expenses of the simple wedding, advancing also the fifteen hundred florins required for the contract.

In spite of their poverty this marriage seems to have been a happy one. There was a strong effort at economy on the part of the young couple who had started on so small a basis. Mozart kept a careful account of his expenses for a while, and in his list of modest outlays there were some flowers for his wife, and a starling. He was always fond of animals, and kept a variety of birds. When this one died he buried it in the garden with a simple ceremonial, giving it a small monument and an inscription. But he was too little used to detail to continue this system, and their affairs soon began to go wrong. If the wife of eighteen was not eminently wise or judicious, she had much of her husband's careless gaiety of heart, which, in the inevitable perplexities of their *ménage*, was the best possible substitute. One morning a friend found them at an early hour waltzing in a rather vigorous fashion. To his surprised look of inquiry Mozart replied, laughingly, "It is an economical method of heating. We have no wood, and I thought a waltz might serve in the place of fuel." Constance sympathized with her husband's musical work without fully appreciating his genius. She sang very well, and the quality of her taste is shown in her passion for Bach's fugues. Mozart writes to his sister that she gave him no peace until he had composed something in the same style. She had also a talent for narration, which was often called into exercise in her husband's forced vigils. The evening before the performance of "Don Giovanni" not a note of the overture was written. At a late hour he asked his wife to make him a glass of punch

and to keep him awake. As the work went on she amused him with fairy tales, varied with original touches and interrupted with frequent bursts of laughter. At last the stories lagged and the master grew heavy. Throwing himself on a couch, he requested his watchful companion to call him in an hour. She let him sleep two. It was then five o'clock, and the copyists were to come at seven. It was only as the clock struck that the last note of this immortal masterpiece was written.

In all his family relations Mozart was the gentlest and tenderest of men. In his darkest moments he puts on a smile, for his adored wife. It is a sad smile, perhaps, with a trace of mockery in it, but if it saves her a care it has done its service. For years she was an invalid, and he used to write by her bedside while she slept, never permitting a sound to disturb her. When he went out in the morning for his early promenade he would steal softly into her room and leave a tender note to greet her waking. Here is one of them.

I wish you good morning, my dear little wife. I hope you have slept well and that nothing has disturbed your repose. Be careful not to take cold, not to rise too quickly, not to stoop, not to reach for anything, not to be angry with the servant. Take care also not to fall upon the threshold in passing from one room to another. Keep all the domestic troubles till I come, which will be soon.

Simple words, but they tell a story of unselfish devotion not too common. And this devotion endured as long as he lived. His last letters to his wife, written out of the depths of suffering and despair, glow with the warmth and tenderness of the most impassioned lover.

MOZART'S EAR. NORMAL EAR.
(FROM A PHOTOGRAPH BY WÜRTHE & SPINNHORN OF A
DRAWING IN THE MOZART MUSEUM.)

His nature was eminently a social one. He was naturally jovial, humorous, *insouciant*, and inclined to take the world on its sunniest side. He entered with great zest into harmless amusements, dressed well, danced well, was extravagantly fond of billiards, which permitted

him to pursue the thread of his musical thought, and personated characters in masquerades with inimitable talent. In such diversions he recovered himself after days and nights of toil. But his generous sympathy led him into perpetual trouble. He was always in debt, because he would borrow from one to relieve

a single word, "the wretch!" and his relations continued as amicable as before. Perhaps it was some late remorse that led the unscrupulous manager to say, after his friend's death, "I see the image of the dying man always before my eyes. His spirit follows me wherever I go and even haunts my sleep." So loyal

MOZART AT THIRTY-FIVE YEARS OF AGE.
(FROM A PAINTING IN POSSESSION OF THE HEIRS OF C. A. ANDRÉ, BY PERMISSION OF HERMAN KERBER.)

another, in his abundant hope never doubting his ability to pay. In his most pressing needs he was never too poor to help a friend. He pawned his watch to aid a worthless musician, who failed to redeem it, and put in his own pocket the money Mozart carelessly sent him for that purpose. If he had nothing else to give he would sit down and coin something from his fertile and overtasked brain. In the depths of his distress, with a heavy debt hanging over him, an invalid wife, helpless children, and his own health rapidly failing, he wrote the "Magic Flute" for Schikaneder, a poor manager who betrayed his trust by disposing of the score which the generous composer had stipulated should remain in his own hands as sole payment for his work. When Mozart heard of this treachery he vented his indignation in

was Mozart's nature that he clung to his friends, in spite of neglect and injury. Near the close of his life he was offered the position of kapellmeister to the King of Prussia and a salary of three thousand thalers. "How can I leave my good emperor?" was his immediate reply. He was given a year to think of it, but a few kind words from the Emperor Joseph made him give up all thought of change, without even stipulating an improvement in his condition. This spirit of delicacy and self-forgetfulness is best appreciated in the abstract. In romances or on the stage the world applauds and weeps over it, in real life it shrugs its shoulders, offers perhaps a word of half-contemptuous pity, and passes by on the other side. It has small consideration for those who are in it but not of it.

Whatever Mozart may have suffered from his careless generosity, he seems to have been free from vice or dissipation. In his last days he was forced sometimes to sustain his flagging strength with stimulants, but we have the testimony of his wife that she never saw him intoxicated. The idle gossip of his enemies tried to make of him a Don Juan, and invented a startling little romance in which he was said to have played an unworthy part. But later investigations have proved this to be a myth, without even a foundation in fact. The whole spirit of his life, the internal evidence of his letters, his transparent truthfulness, as well as his rare and unceasing devotion to his wife, are living contradictions of such calumnies, and show him to have been a man of refined instincts and pure character. At heart he was profoundly religious. "Let not my papa be troubled," he wrote on his last Paris tour; "I have God continually before my eyes. I acknowledge his power and I fear his anger, but I know also his love, his pity, and his compassion. He will never forsake his servants. If things go according to his will, they will go also according to mine; so I cannot fail to be happy and contented." In his later life he became an ardent Freemason, and relaxed a little in the severity of his beliefs, but the beautiful spirit of trust in the Divine wisdom he cherished always. It was a religion of love that he craved and believed in, indeed it may be said that love was the keynote of his character.

That he was full of inequalities cannot be denied. It is impossible to make of him a symmetrical figure according to worldly models, or to present him as a perfectly poised man. His frank, open nature does not lend itself readily to idealization. There was none of the romantic mystery about him that cast such an illusive aureole over the more exclusive and self-centered Chopin, nor had he the fascinating personality of Mendelssohn. He does not pose in classical drapery, and his character was not commensurate with his genius. His judgment was the toy of his feeling and, excepting where his art or his honor was concerned, his will was weak and vacillating. But his very faults sprang from an unthinking nobility of soul. Without guile himself, he believed every one else was so. If he spent his last penny upon a moment's impulse, it was more likely to be for another's sake than for his own. If he plunged recklessly into pleasure, it was after days of ceaseless toil, when the tension must be loosened or the delicate strings would break. Excess in one direction was the momentary reaction from excess in another. If he lacked the tact of the courtier, his face beamed with truth and sincerity. He had the common heritage of artists, an organization fine and over-

wrought. If it ever led him astray the world can well afford to drop a forgiving tear, remembering how freely he gave to others of the best he had, and how little he kept for himself; remembering, too, the tender sensibility, the sweet simplicity of faith, the abounding sympathy, and the singular unworldliness that made him to the end a child in practical matters.

It is in his music that we must look for a measure of Mozart's intellectual power, which is shown nowhere else in lines proportioned to his greatness. But it is not so easy to catch the mental lineaments of musicians as of those who express themselves through a more definite and tangible medium. We may judge of their genius and their science, we may feel their strength, we may divine their spiritual complexion, but of the thoughts that furnish a definite key to their inner life we usually know very little. And of all musicians Mozart was the least personal in things pertaining to his art. We may often suspect that some profound experience has added a touch of vividness to his marvelous musical coloring, but we find nothing to suggest his own individuality. He traverses the entire gamut of human emotions, moves easily from romantic opera to the grandest forms of religious music, displays equal skill in broad comedy and an arrangement of Handel, constructs intricate fugues and massive symphonies with as much facility as the popular dance-music which was his surest means of livelihood. But he deals very little with formulas, and not at all with the psychological side of his work. He is not a singer of his own joys or sorrows. He is ruled by no dominant mood, lives in no narrow dreamland, cherishes no gloomy introspection. His soul is like an Æolian harp, which every passing wind wakens into melody. There is no more trace of his nationality than of his personality in most of his creations. He seems to have risen into a broader world, and it was this very breadth and universality that left him so alone in the great center of musical art. In his idyllic simplicity and the free, careless, sensuous spirit of the south, that runs like a thread of sunlight through so much of his music, he resembles Haydn; but he has greater breadth and spontaneity. He is finer, too, more delicate, more penetrating, and more passionate. If he did not reach the lonely grandeur of Beethoven, if his sensitive spirit did not find its inspiration in the eternal solitudes of a Titanic imagination, he had a warmer human sympathy, and the sunny healthfulness, the plastic beauty, the divine charm of the Greek ideals. His compositions have the symmetry, the lightness, the grace, the perfection of the Hellenic temples. His southern impetuosity is never violent, his de-

PORTRAIT OF MOZART.
(PAINTED BY LORENZ VOGEL, 1887. PHOTOGRAPHED BY FRANZ HAUFSTAENGL.)

lineations of passion are never exaggerated. "Music," he says, "ought never to wound the ear. Even in situations the most heartrending it should always please; in a word, music should always remain music." But he adds to the light-hearted *insouciance* and the unerring taste of the Greek something born of modern life—a voice from the great heart of a humanity that has become conscious of itself. He touches here the vein that Beethoven carried to its supreme point.

It is impossible in a brief essay that does not claim to be critical to consider the numerous and varied forms of composition left by this most prolific and versatile of masters. A single glance at the catalogue in which the seven hundred and seventy-nine of his known works are registered fills one with amazement at the gigantic results of his short life. In instrumental music he created no new forms, but he breathed

fresh spirit into the old ones. Preserving the symphonic frame of Haydn, he reveals new resources of harmony, opens wider perspectives, adds a warmer and more passionate coloring, and charms with his inexhaustible melody. In music for the church his deep religious nature finds its natural expression. How perfectly he enters into the mysteries of his faith is best shown in his own words. "Ah," he said one day to a Protestant friend, "you have your religion in the head and not in the heart; you do not feel the meaning of those words, *Agnus Dei qui tollis peccata mundi, dona nobis pacem*. When one has been, like myself, introduced from the tenderest infancy into the mystic sanctuary of our religion; when, with a soul agitated by vain aspirations, one has assisted at the Divine service where music translates these holy words, *Benedictus qui venit in nomine Domini*—oh, then it is very

different. Later, when one is wearied with the void of a vulgar existence, these first impressions, ineffaceable in the depth of the heart, revive and rise to the mind like a sigh that expands." The tremulous prayer of a tender mother, the impassioned longing of a world in tears, the serene and pitying voice of Divine consolation, the anthem of joy and the hymn of sorrow—all these find a fresh and more poetic color in his inspired strains.

But it is in the musical drama that Mozart has won his most permanent fame. Here his special gifts, his clearness, his flow of melody, his knowledge of stage effects, his command of orchestral coloring, his dramatic genius have their fullest scope. If he had met in the Emperor Joseph as sympathetic a friend as Wagner found in the Bavarian king a century later, what might not have been accomplished by his fertile pen? But the music-loving emperor never at all comprehended the treasure within his reach. He recognized Mozart's talent for instrumental music and his gifts as a virtuoso, but did not appreciate his compositions for the voice. "Much too fine for our ears and too many notes" was his comment after hearing "*Il Seraglio*." "Precisely as many as are needed," replied Mozart, with more frankness than tact. Yet this work is regarded to-day as the germ of the national opera which it was the ambition of both to found. Weber, who was the legitimate successor of Mozart in this field, said that it represented the full maturity of his genius. "I find in this work," he remarked, "the reflection of his youth, that flower of life which blossoms no more when once it is closed." The fame of the composer rests more assuredly upon his later works; but "*Il Seraglio*" was written just before his marriage, the heroine bearing the name of his wife, and he has left upon it the stamp of the poetry born of youth and love.

He returns to his early ideals in the "*Magic Flute*," which marked his last triumph. When he wrote it youth and hope were gone; his wife, through the kindness of a friend, had gone to Baden to recruit her shattered health; poverty, sickness, and debt were pursuing him; and he was already a prey to the saddest presentiments. The shrewd manager, knowing Mozart's disposition to put off finishing the works that shaped themselves with such facility in his head, installed him in a small pavilion in a garden near the theater—the pavilion which now stands on the Capuzinerberg overlooking Salzburg—a late legacy from the city that gave him a pauper's grave to the city that gave him birth and rudely sent him adrift to his death. In this quiet spot, enlivened by the convivial stories of his friends who sought thus to drive away his melancholy, Mozart finished the ex-

quisite creation whose rich fruits he was destined never to reap, in the early days of the last summer of his life. "If I do not help you, my poor Schikaneder, and if the work does not succeed, you must not blame me, for I am not used to writing fairy tales." But what delicacy of imagination, what subtle delineations, what touches of humor, what wealth of fancy! Upon a weak and flimsy libretto he has constructed a fairy palace of harmony. Among Mozart's dramatic works, Beethoven preferred the "*Magic Flute*," because "here alone he has shown himself truly German."

But the dramatic gifts of Mozart reached their culminating-point in "*Don Giovanni*." This imperishable work, written in six weeks in a picturesque suburb of the quaint old city of Prague, where he had the inspiration of cordial sympathy and appreciation, illustrates better than any other the distinguishing traits of his many-sided genius. Its wide range of life, its artistic truth, its perfection of detail, its philosophical depth, its marvelous character-painting, combined with its richness of instrumentation and its inimitable musical coloring, give it a place apart in the history of the lyric drama. From the few weird and solemn modulations at the beginning of the overture, which foreshadow the tragical close, to the magnificent finale, which is in itself a masterpiece, it is a striking illustration of the power of music to paint the thousand varying shades of human emotion. Mozart was eminently the musician of humanity. His observation was of the keenest, and the rapidly changing phases of life mirrored themselves with wonderful distinctness in his clear intelligence. With a few notes, a few simple chords, he seizes an individuality. His characters do not speak in artificial formulas, which must be learned before they have a living significance. So perfectly is his language in unison with his thought that it seems but a more etherealized expression of it. Mocking humor, grief, outraged dignity, love, passion, fear, despair twine and intertwine in the texture of the music, like many-colored threads which may be traced with unerring clearness in the illuminated web of harmony. With what justness, what simplicity is each character defined against the ever-shifting background of a grand symphony! Nothing is exaggerated, nothing stilted, nothing artificial. It is the last touch of color given to a portrait that marks the mastery of the artist, the subtle insight of the poet. This touch adds the divine flame, the living soul. Here Mozart was supreme. He has portrayed the characters of the quaint old Spanish legend so naturally, so gracefully, so vividly, and so humorously that the world has laughed and wept over them for nearly a century, and, in spite of the inherent

vulgarity of the subject, the work is as fresh to-day as when it was written. It was said by Goethe that Mozart alone could worthily have interpreted his "Faust."

It is somewhat the fashion to contrast the work of Mozart with that of his great modern successor. In his own day he was subjected to much of the same criticism that Wagner suffers in ours, but the genius of the two men was essentially unlike. Wagner was first poet, then musician. With his fiery soul seething in revolt against the limitations of life as he found it, the wild legends of unrest, the savage freedom of a heroic age had a natural fascination for him. His colossal imagination reveled in the grand conceptions, the grand passions of a primeval world, and he called upon all the arts to serve him in the creation of a new art which should adequately represent them. This art is like a magnificent kaleidoscope which at every turn reveals a thousand fleeting forms, each more beautiful and more evanescent than the last. The genius of Wagner has something massive, virile, and superbly passionate, after the manner of the heroes of a twilight age. Mozart is the inspired singer in whose delicate imagination the sentiments and emotions of universal humanity are transfigured into forms of enduring beauty. Grace, melody, sweetness, healthfulness, simplicity are his dominant traits. Underlying all this are the subtle essence of poetry and the spirit of love. But his sentiment never degenerates into sentimentality, nor his delicacy into weakness. His lyre has many strings, and his song is clear and vigorous. It is the harmonious blending of all the colors that gives the pure white light. Wagner sought in music the supreme expression of his thought. In Mozart it was the simple and spontaneous incarnation of the thought. Both were creators, both poets, both artists unrivaled in their sphere. It is the Titanic force of a Michelangelo and the spiritual grace of a Raphael.

THE record of Mozart's life during its closing years is little more than a series of struggles for the bare necessities of existence, brightened by a few successes that brought him more fame than money. Grave responsibilities crowded upon him, and he had no means of meeting them. Night and day he toiled, but it was the hopeless effort to "climb the ever-climbing wave." These hours of unrewarded labor were claiming their penalty, and he was slowly dying, while fortune showered its favors upon inferior rivals. Some of his best works were killed by powerful cabals. "Figaro" was driven from the stage after a brief success by a work that is not heard of to-day. "Salieri and his set are moving heaven and earth to kill it," wrote Leopold Mozart, who was in Vienna on his first

and last visit to his son. Even "Don Giovanni" had a cold reception, except in Prague. "It is celestial music," said the emperor, "but, unfortunately, it does not agree with my Viennese." "Ah, well!" replied Mozart on hearing of this remark, "let them take time to digest it." To some one he said, "'Don Giovanni' was written for the people of Prague, but, before all, for a few friends and myself."

He was heavily in debt; he could borrow no more; his wife was ill, and his strength was gone. It is pitiful to read of the dire straits to which he was reduced. A letter to the kindly Puchberg reveals the depth of his distress:

You are right, my dear friend, to leave my notes without response. My importunity is truly very great; but consider my frightful position, and you will pardon my persistence. If you can still once more relieve me from a momentary embarrassment—oh, I pray you to do so for the love of the good God; I will accept with gratitude the least thing you can spare.

"Write in a more easy, popular style," said his publisher, "or I will not print a note nor give you a kreutzer." "Then, my good sir," replied Mozart, whose artistic conscience was incorruptible, "I have only to resign myself and die of hunger." After the death of Gluck he received the appointment of chamber-musician to the imperial court, with a salary reduced from two thousand to eight hundred florins. "Too much for what I do, too little for what I could do," was Mozart's comment upon an office that brought him few duties, small pay, and little honor. "I cannot contain my indignation," said Haydn, "when I think that this rare man is still in search of a position, and that neither prince nor sovereign has an idea of attaching him to his service." To Leopold Mozart he remarked, "I swear to you, upon my honor and before God, that in my opinion your son is the greatest composer in the world."

The last work of Mozart was a fitting close to the tragedy of his life. One cannot read the oft-told tale of the "Requiem" without a sympathetic tear. The light of subsequent facts has long since dissipated the atmosphere of mystery that hung over it for so long a time. We know now that it is to the vanity of a man willing to make his wife's death the occasion for posing before the world in borrowed plumes as a musical composer that we owe this immortal funeral-hymn. With Mozart's extreme susceptibility, heightened by his failing health and his dark outlook, it is not strange that the somber and unknown messenger who appeared before him to order a requiem for a nameless friend seemed to foreshadow his own doom. Haunted by this conviction, he rallied all his drooping energies for this final work. "I wish

to condense in it all my art, all my science," he writes to his wife, "and I hope that after my death my enemies, as well as my friends, may find in it instruction and a model." He was interrupted in the midst of it by an order to write an opera for the great festival at Prague. "*La Clemenza di Tito*" was written and put on the stage in eighteen days; then Mozart returned to his last task. He was pursued by the idea that he had been poisoned, and in order to divert his mind his wife took away his work. His spirits revived a little, and after a few days of repose he called for his music again. To a friend, probably Du Ponte, who tried to sustain his courage, he wrote a note in Italian, the last we have from his hand:

I would willingly follow your counsel, but how can I do it? My mind is struck, and I cannot dispel the image of that unknown man. I see him continually before me; he presses me, pursues me without ceasing, and urges me to composition in spite of myself. When I wish to stop, the repose fatigues and harasses me more than the work. Must I say it? I regard the future without fear or terror. I feel that my hour is about to strike. I touch the limits of my life. I am going to die before having enjoyed the fruits of my talent. Yet life is so beautiful! My career opened under such happy auspices! Alas! one cannot change his destiny. No one here is master of his fate, and I resign myself. It will be as it pleases God; as for myself, I must finish my funeral-hymn.

Into this exalted work he breathed the last flame of his divine genius. In the hymn of death the sorrows, the longings of his life found voice. Who can listen to the sublime and heart-rending strains of the "*Lachrymosa*" without feeling that beneath the prayer for pity is the cry of a suffering human soul? It is the prayer of the world translated into a form of everlasting beauty by one who adds to the divination of the poet a subtle something born of individual tears.

In the intervals of fever and delirium Mozart still works at the "*Requiem*," giving directions also to Süssmayer as to its completion. Just how much was left for this pupil to do can never be exactly determined; but it is well known that the master usually had every note of his compositions in his head before putting anything on paper, and it is not in the least probable that, conscious of the nearness of the end, he left the last touches of so important a work to be added by another without giving him the outlines and motives of the unfinished parts, together with his plan of instrumentation.

While the public of Vienna was wild with enthusiasm over the "*Magic Flute*" Mozart followed the nightly performance in his bare little room, with a watch beside him, counting the fast-fleeting moments as the play went on.

"Ah! Sophie," he said to his sister-in-law, whom he had thoughtfully asked to stay with Constance the last night of his life, "did I not tell you that I was writing the '*Requiem*' for my own funeral?" A few hours before the end he joined the friends at his bedside in singing the parts already finished. At the "*Lachrymosa*" he began to weep, and could sing no more. He died with the score beside him.

"As death, taken all in all, is the true end of life," he said in his last letter to his father four years before, "I have grown so familiar for a couple of years with this real and devoted friend, that its aspect, far from inspiring me with terror and fear, offers me only consoling thoughts and sweet hopes. I thank God for having accorded to me the favor of looking upon it as the key to our veritable beatitude."

These closing days brought him the certainty of a competence. After the brilliant success of the "*Magic Flute*" offers crowded upon him that opened a future of comparative ease. But it was too late.

His last act was one of love. Having received the appointment of kapellmeister at the cathedral, he requested that his death should be kept secret until Albrechtsberger had secured the succession to the place which was not yet vacant.

"It is indeed a pity for the great genius, but fortunate for us that he is dead," said Salieri. "If he had lived longer, no one would have given us a morsel of bread for our work." It is pleasant to recall in contrast the cordial appreciation of Haydn. "Oh, my friends!" he exclaimed with tears, when the tidings of Mozart's death reached him in London, "will the world ever find such an artist again?" Years afterward, when the conversation turned one day upon the unfortunate composer, he wept like a child. "Pardon me," said he, "but I can never hear the name of my gentle Mozart pronounced without breaking my heart."

The hand of a pitiless fate pursued the master even to the tomb. There was no money to buy a grave, and Van Swieten, a rich amateur for whom Mozart had done a great deal of gratuitous work, and who attended to the details of the funeral, did not think it worth while to expend a few florins to give him a respectable burial. No solemn requiem for one who had written the funeral hymn of the world! No stately service to mark the public regard for the illustrious dead! A poor bier in one of the small side-chapels of the cathedral, a handful of friends, a simple prayer—that was all. The little cortège went out into a driving storm. As if Nature wept over the pathetic scene, the rain fell in torrents, mingled with scattered snowflakes tossed about by the violent wind. One by one the straggling friends dropped off, and

at the gate of the cemetery only one faithful servant was left. So the greatest musical artist of his time was laid in a common trench, side by side with the nameless poor, without a friend to drop a tear or mark the place where he rested. His wife was ill, prostrated with grief. When she was able to go out the grave-digger, too, was dead, and no trace of the spot where Mozart lies has ever been found.

In one corner of the cemetery at St. Marx stands to-day a solitary monument surrounded by the little white crosses that mark the graves of the nameless poor for a few years, until they are taken away to make room for the newly dead. A pedestal of gray granite is surmounted by the bronze figure of a Muse sitting upon a pile of books bearing the names of Mozart's principal works. In her left hand she holds a harp, which rests upon a wreath of laurel hung carelessly over the books, while the right hand grasps the score of "*Dies Iræ*." The head

droops in pity, and the face is unutterably sad. The four corners of the base bear each a candelabrum twined with laurel. The front of the pedestal has a bronze relief of the composer, and the rear a wreathed harp. On one side is written "Wolfgang Amadeus Mozart, born January 27, 1756; died December 5, 1791." Nearly seventy years after his death this tardy tribute was erected over his supposed burial-place.

But genius has left its own imperishable monument. The world still laughs and weeps over Mozart's divine creations, when he who would have been gladdened by its sympathy is no longer conscious of it. The inspired singer of Salzburg, who felt so keenly and voiced so perfectly the joys and the sufferings of humanity, sleeps in an unknown grave; but his sorrowful face looks back upon us to-day across the mists of a century crowned with a radiant immortality though veiled in eternal tears.

REMEMBRANCE.

(FROM A JAPANESE GARDEN.)

ONE year ago, a bleak November,
I walked along the chilly ways
Where through the gray, damp, misty haze
The Isis flows.

How well, how clearly, I remember
The drear homesickness for the sun,
There where the skies were always dun,
And life dull prose.

And now, this radiant November,
Where gold chrysanthemums upraise
A glory o'er my garden-ways,
And blooms the rose,

With some strange longing I remember
Gray Oxford, 'neath her skies of dun.
Alas, that I should be her son,
And love her prose!

William Sharp.

THE TWO LESSONS.

Disce, puer, virtutem ex me, verumque laborem;
Fortunam ex aliis.—*Æneas to Ascanius* ("Æneid," XII., 435).

LEARN, boy, from me what dwells in man alone,
Courage immortal, and the steadfast sway
Of patient toil, that glorifies the day.
What most ennobles life is all our own;
Yet not the whole of life; the fates atone
For what they give by what they keep away.
Learn thou from others all the triumphs gay
That dwell in sunnier realms, to me unknown.
Each life imparts one lesson; each supplies
One priceless secret that it holds within.
In your own heart — there only — stands the prize.
Foiled of all else, your own career you win.
We half command our fates; the rest but lies
In that last drop which unknown powers fling in.

Thomas Wentworth Higginson.

A CHRISTMAS FANTASY, WITH A MORAL.

HER name was Mildred Wentworth, and she lived on the slope of Beacon Hill, in one of those old-fashioned swell-front houses which have the inestimable privilege of looking upon Boston Common. It was

Christmas afternoon, and she had gone up to the blue room, on the fourth floor, in order to make a careful inspection in solitude of the various gifts that had been left in her slender stocking and at her bedside the previous night.

Mildred was in some respects a very old child for her age, which she described as being "half-past seven," and had a habit of spending hours alone in the large front chamber occupied by herself and the governess. This day the governess had gone to keep Christmas with her own family in South Boston, and it so chanced that Mildred had been left to dispose of her time as she pleased during the entire afternoon. She was well content to have the opportunity, for fortune had treated her magnificently, and it was deep satisfaction, after the excitement of the morning, to sit in the middle of that spacious room, with its three windows overlooking the pearl-crusted trees

in the Common, and examine her treasures without any chance of interruption.

The looms of Cashmere and the workshops of Germany, the patient Chinamen and the irresponsible polar bear, had alike contributed to those treasures. Among other articles was a small square box, covered with mottled paper and having an outlandish, mysterious aspect, as if it belonged to a magician. When you loosened the catch of this box, possibly supposing it to contain bonbons of a superior quality, there sprang forth a terrible little monster, with a drifting white beard like a snow-storm, round emerald-green eyes, and a pessimistic expression of countenance generally, as though he had been reading Tolstoi or Schopenhauer.

This abrupt personage, whose family name was Heliogabalus, was known for simplicity's sake as Jumping Jack; and though the explanation of the matter is beset with difficulties, it is to be said that he held a higher place in the esteem of Miss Wentworth than any of her other possessions, not excluding a tall wax doll, *fin de siècle*, with a pallid complexion and a profusion of blond hair. Titania was not more in love with Nick Bottom the weaver than Mildred with Jumping Jack. It was surely not his personal beauty that won her, for he had none; it was not his intellect, for intellect

does not take up its abode in a forehead of such singular construction as that of Jumping Jack. But whatever the secret charm was, it worked. On a more realistic stage than this we see analogous cases every day. Perhaps Oberon still exercises his fairy craft in our material world, and scatters at will upon the eyelids of mortals the magic distillation of that "little western flower" which

Will make or man or woman madly dote
Upon the next live creature that it sees.

For an hour or so Mildred amused herself sufficiently by shutting Heliogabalus up in the chest and letting him spring out again; then she grew weary of the diversion, and finally began to lose patience with her elastic companion because he was unable to crowd himself into the box and undo the latch with his own fingers. This was extremely unreasonable; but so was Mildred made.

"How tedious you are!" she cried, at last. "You dull little old man, I don't see how I ever came to like you. I don't like you any more, with your glass eyes, and your silly pink mouth always open and never saying the least thing. What do you mean, sir, by standing and staring at me in that tiresome way? You look enough like Dobbs the butcher to be his brother, or to be Dobbs himself. I wonder you don't up and say, 'Steaks or chops, mum?' Dear me! I wish you really had some life in you, and could move about, and talk with me, and make yourself agreeable. Do be alive!"

Mildred gave a little laugh at her own absurdity, and then, being an imaginative creature, came presently to regard the idea as not altogether absurd. If a bough that has been frozen to death all winter can put forth blossoms in the spring, why might not an inanimate object, which already possessed many of the surface attributes of humanity, and possibly some of the internal mechanism, add to itself the crowning gift of speech? In view of the daily phenomena of existence, would that be so very astonishing? Of course the problem took a simpler shape than this in Mildred's unsophisticated thought.

She folded her hands in her lap, and, rocking to and fro, reflected how pleasant it would be if Jumping Jack, or her doll, could come to life, like the marble lady in the play, and do some of the talking. What wonderful stories Jumping Jack would have to tell, for example. He must have had no end of remarkable adventures before he lost his mind. Probably the very latest intelligence from Lilliput was in his possession, and perhaps he was even now vainly trying to deliver himself of it. His fixed, open mouth hinted as much. The Land of the Pygmies, in the heart of Darkest Africa—

just then widely discussed in the newspapers—was of course familiar ground to him. How interesting it would be to learn, at first hand, of the manners and customs of those little folk. Doubtless he had been a great traveler in foreign parts; the label, in German text, on the bottom of his trunk showed that he had recently come from Munich. Munich! What magic there was in the very word! As Mildred rocked to and fro, her active little brain weaving the most grotesque fancies, a drowsiness stole over her. She was crooning to herself fainter and fainter, and every instant drifting nearer to the shadowy reefs on the western coast of Nowhere, when she heard a soft, inexplicable rustling sound close at her side. Mildred lifted her head quickly, just in time to behold Heliogabalus describe a graceful curve in the air and land lightly in the midst of her best Dresden china tea-set.

"Ho, ho!" he cried, in a voice preternaturally gruff for an individual not above five inches in height. "Ho, ho!" And he immediately began to throw Mildred's cups and saucers and plates all about the apartment.

"Oh, you horrid, wicked little man!" cried Mildred, starting to her feet. "Stop it!"

"Oh, you cross little girl!" returned the dwarf, with his family leer. "You surprise me!" And another plate crashed against the blue-flowered wall-paper.

"Stop it!" she repeated; and then to herself, "It's a mercy I waked up just when I did!"

"Patience, my child; I'm coming there shortly, to smooth your hair and kiss-you."

"Do!" screamed Mildred, stooping to pick up a large Japanese crystal which lay absorbing the wintry sunlight at her feet.

When Heliogabalus saw that, he retired to the further side of his tenement, peeping cautiously over the top and around the corner, and disappearing altogether whenever Mildred threatened to throw the crystal at him. Now Miss Wentworth was naturally a courageous girl, and when she perceived that the pygmy was afraid of her she resolved to make an example of him. He was such a small affair that it really did not seem worth while to treat him with much ceremony. He had startled her at first, his manners had been so very violent; but now that her pulse had gone down she regarded him with calm curiosity, and wondered what he would do next.

"Listen," he said presently, in a queer, deferential way, as he partly emerged from his hiding-place; "I came to request the hand of mademoiselle yonder," and, nodding his head in the direction of Blondella, the doll, he retreated bashfully.

"Her!" cried Mildred, aghast.

"You are very nice, but I can't marry out of my own set, you know," observed Heliogabalus, invisible behind his breastwork. This shyness was mere dissimulation, as his subsequent attitude proved.

"Who would have thought it!" murmured Mildred to herself; and as she glanced furtively at Blondella, sitting bolt upright between the windows, with her back against the mopboard, Mildred fancied that she could almost detect a faint roseate hue stealing into the waxen cheek. "Who would have thought it!" And then, addressing Jumping Jack, she cried, "Come here directly, you audacious person!" and she stamped her foot in a manner that would have discouraged most suitors.

But Heliogabalus, who had now seated himself on the lid of his trunk and showed no trace of his late diffidence, smiled superciliously as he twisted off a bit of wire that protruded from the heel of one of his boots.

This effrontery increased Miss Wentworth's indignation, and likewise rather embarrassed her. Perhaps he was not afraid of her after all. In which case he was worth nothing as an example.

"I will brush you off, and tread on you," she observed tentatively, as if she were addressing an insect.

"Oh, indeed," he rejoined derisively, crossing his legs.

"I will!" cried Mildred, making an impulsive dash at him.

Though taken at a disadvantage, the manikin eluded her with surprising ease. His agility was such as to render it impossible to determine whether he was an old young man or a very young old man. Mildred eyed him doubtfully for a moment, and then gave chase. Away went the quaint little figure, now darting under the brass bedstead, now dodging around the legs of the table, and now slipping between the feet of his pursuer at the instant she was on the point of laying hand on him. Owing doubtless to some peculiarity of his articulation, each movement of his limbs was accompanied by a rustling wiry sound, like the faint reverberation of a banjo-string somewhere in the distance.

Heliogabalus may have been a person with no great conversational gift, but his gymnastic acquirements were of the first order. Mildred not only could not catch him, but she could not restrain the manikin from meanwhile doing all kinds of desultory mischief; for in the midst of his course he would pause to overturn her tin kitchen, or shy a plate across the room, or give a vicious twitch to the lovely golden hair of Blondella, in spite of—perhaps in consequence of—his recent tender advances. It was plain

that in eluding Mildred he was prompted by caprice rather than by fear.

"If things go on in this way," she reflected, "I sha'n't have anything left. If I could only get the dreadful little creature into a corner! There goes my tureen! What *shall* I do?"

To quit the room, even for a moment, in order to call for assistance at the head of the staircase, where, moreover, her voice was not likely to reach any one, was to leave everything at the mercy of that small demon. Mildred was out of breath with running, and ready to burst into tears with exasperation, when a different mode of procedure suggested itself to her. She would make believe that she was no longer angry, and perhaps she could accomplish by cunning what she had failed to compass by violence. She would consent—at least seem to consent—to let him marry Blondella, though he had lately given no signs of a very fervid attachment. Beyond this Mildred had no definite scheme, when the story of the Fisherman and the Evil Afrite flashed upon her memory from the pages of "The Arabian Nights." Her dilemma was exactly that of the unlucky fisherman, and her line of action should be the same, with such modification as the exigencies might demand. As in his case, too, there was no time to be lost. An expression of ineffable benevolence and serenity instantly overspread the features of Miss Wentworth. She leaned against the wardrobe, and regarded Jumping Jack with a look of gentle reproach.

"I thought you were going to be interesting," she remarked softly.

"Ain't I interesting?" asked the goblin, with a touch of pardonable sensitiveness.

"No," said Mildred, candidly; "you are not. Perhaps you try to be. That's something, to be sure, though it's not everything. Oh, I don't want to touch you," she went on, with an indifferent toss of her curls. "How old are you?"

"Ever so old and ever so young."

"Truly? How very odd to be both at once! Can you read?"

"Never tried."

"I'm afraid your parents did n't bring you up very well," reflected Mildred.

"I speak all languages. The little people of every age and every country understand me."

"You're a great traveler, then."

"I should say so!"

"You don't seem to carry much baggage about with you. I suppose you belong somewhere, and keep your clothes there. I really should like to know where you came from, if it's all the same to you."

"Out of that box, my dove," replied Jumping Jack, having become affable in his turn.

"Never!" exclaimed Mildred, with a delightful air of incredulity.

"I hope I may die," declared Heliogabalus, laying one hand on the left breast of his main-spring.

"I don't believe it," said Mildred, confidently.

"Ho, ho!"

"You are too tall, and too wide, and too—fluffy. I don't mean to hurt your feelings, but you *are* fluffy. And I just want you to stop that ho-hoing. No; I don't believe it."

"You don't, don't you? Behold!" And placing both hands on the floor, Heliogabalus described a sudden circle in the air, and neatly landed himself in the box.

He was no sooner in than Mildred clapped down the lid, and seated herself upon it victoriously. In the suddenness of her movement she had necessarily neglected to fasten the catch; but that was a detail that could be attended to later. Meanwhile she was mistress of the situation and could dictate terms. One thing was resolved: Jumping Jack was never to jump again. To-morrow he should be thrown into the Charles at the foot of Mount Vernon street, in order that the tide might carry him out to sea. What would she not have given if she could have sealed him up with that talismanic Seal of Solomon which held the cruel marid so securely in his brazen casket? Of course it was not in Mildred's blood to resist the temptation to tease her captive a little.

"Now, Mr. Jack, I guess I've got you where you belong. If you are not an old man this very minute, you will be when you get out. You wanted to carry off my Blondella, did you? I hope you're quite comfortable."

"Let me out!" growled Heliogabalus in his deepest bass.

"I could n't think of it, dear. You are one of those little boys that should n't be *either* heard or seen; and I don't want you to speak again, for I'm sitting on your head, and your voice goes right through me. So you will please remember not to speak unless you are spoken to." And Mildred broke into the merriest laugh imaginable, recollecting how many times she herself had been extinguished by the same instructions.

But Mildred's triumph was premature, for the little man in the box was as strong as a giant in a dime museum; and now that he had fully recovered his breath, he began pushing in a most systematic manner with his head and shoulders, and Mildred, to her great consternation, found herself being slowly lifted up

on the lid of the chest, do what she might. In a minute or two more she must inevitably fall off, and Jumping Jack would have her! And what mercy could she expect at his hands, after her treatment of him! She was lost! Mildred stretched out her arms in despair, gave a shriek, and opened her eyes, which had been as tightly shut as a couple of morning-glories at sundown.

She was sitting on a rug in the middle of the room. Though the window-panes were still flushed with the memory of the winter sunset, the iridescent lights had faded out in the Japanese crystal at her feet. She was not anywhere near the little imp. There he was over by the fireplace, staring at nothing in his usual senseless fashion. Not a piece of crockery had been broken, not a chair upset, and Blondella, the too-fascinating Blondella, had not had a single tress disarranged.

Mildred drew a long breath of relief. What had happened? Had she been dreaming? She was unable to answer the question; but as she abstractedly shook out the creases in the folds of her skirt, she remarked to herself that she did not care, on the whole, to have any of her things come to life, especially Jumping Jack. Just then the splintering of an icicle on the window-ledge outside sent a faint whiteness into her cheek, and caused her to throw a quick, apprehensive glance toward the fireplace: After an instant's hesitation, Mildred, with Blondella under her arm, stole softly from the room, where the specters of the twilight were beginning to gather rather menacingly, and went downstairs to join the family and relate her strange adventure.

THE analysis of Miss Wentworth's dream — if it were a dream, for later on she declared it was not, and hurriedly gave Heliogabalus to an unpleasant small boy who lived next door — the analysis of her dream, I repeat, shows strong traces of a moral. Indeed the residuum is purely of that stringent quality. Heliogabalus must be accepted as the symbol of an ill-considered desire realized. The earnestness with which Miss Wentworth invoked the phantasm, and the misery that came of it, are a common experience. Painfully to attain possession of what we don't want, and then painfully to waste our days in attempting to rid ourselves of it, seems to be one of the tasks set us here below. I know a great many excellent persons who spend the best part of life in endeavoring to get their particular Jumping Jack snugly back into its box again.

THE ANNUNCIATION TO THE SHEPHERDS, BY J. BASTIEN LEPAGE.

THE BOWERY.

T was the opinion of the most observant traveler I ever knew that no city in Christendom possesses a street comparable with the Bowery in New York city. His comment on the Bowery was that it is the only noble and important thoroughfare which is foreign to the city and country that possess it. I think it is the belief of nearly all traveled Americans that the Bowery is the most interesting thoroughfare in America. If there are any who are inclined to dispute the belief, it will repay them to consider the Bowery even more closely than did my friend who called it foreign to its country, for he supposed it to be a German street in America. It is largely German, but it is much else besides, and the more it is studied the more cosmopolitan it will seem, and the more peculiarities it will reveal.

In endeavoring to compare it with some other crowded, humming, Babylonish artery of petty commerce and jostling human surplussage, the mind turns to the Strand in London. But it does not rest there, for though the Strand is about as long as the Bowery, it is a lane by comparison, and though the Strand lives one life by day and another by night, as the Bowery does, it is as English as the rest of London, and it is mainly dignified, respectable, and well-to-do. It is comprehensible to any one who walks the length of it once; but the oftener you walk the Bowery the more heterogeneous and contradictory you will find it. It is good to the pure in heart, criminal to the wicked, abandoned and disreputable to the outcast. It is the main boulevard of a population of nearly 300,000 East-Siders—their Strand for practical, matter-of-fact shopping by day, and for the pleasures of the theater and the concert-garden by night. But they maintain only two sides of it. Its half-dozen other characters rely for maintenance on strangers from every corner of the world—because to the immigrant and the poor new-comer it is the great show street of the town.

The Bowery is very old. It got its name from the first settlers of Manhattan, and dates with them. The word *bouwerij* is Dutch for farm, or country-seat, and our street derives its name from the fact that it ran through the bowery, or farm, of Peter Stuyvesant, Governor-in-chief of Amsterdam in the New Netherlands, and of the Dutch West India Islands.

His estate reached from the highway to the East River, and the Stuyvesant mansion, just north of St. Mark's Church on Second Avenue, remains in a modern and enlarged form. His dust is hidden from us by a great stone that incloses a vault under the east wall of the present church, which is called "St. Mark's in the Bowery," though it was built in 1795, more than a century after the Dutch governor died.

In English colonial days the Bowery was the beginning, or the end, of the Boston Road, and during the Revolution, the present Atlantic Garden was the Bull's Head Tavern, or sojourn-ingplace and exchange of the New York drovers and butchers of that day. Next door, on the site now occupied by the famous old Bowery Theater, was the cattle-market, an inclosed lot for the herding and sale of cattle. There the British made it a custom to enjoy bear-baiting, that sport to which it was afterward so wittily said that the Puritans objected, not because it hurt the bears but because it amused the people.

Then came a period when the Bowery had grown to be not only a long and important street, but a respectable one. Tom Hamblin was the manager of the old Bowery Theater at that time, and the first players of the country and of England performed there to notable audiences. They cannot have escaped severer criticism than their sons, the Booths and Wallacks of our day, have been accustomed to, for a preacher of that time made a solemn sensation by saying that when he passed that theater he saw the people jostling one another down the steps into a great black, yawning hole under the ground, and over their heads he read the awful, the ominous words, "The Pit." In those days many rich and aristocratic families lived over on the East Side beyond the Bowery. The Quakers, now few and seldom heard of, were numerous and notable among them, and East Broadway—the heart of the Polish Hebrew quarter—was a splendid street. But the city grew, and with its growth came the development of the Volunteer Fire Department, and with that the Bowery changed again. Many of the finest young men of the town belonged to the fire-companies at first; sons of rich men and young mechanics pulled shoulder to shoulder at the ropes. But an era of ruffianism was at hand—an era that produced in New York, Philadelphia, and Baltimore such scenes and conditions as we can scarcely comprehend to-day. Gangs of fighting men infested various localities and terrorized the community. The rivalry and strife of the fire-companies in part attracted them and in part

OLD ROOFS AND DORMERS.

developed them. From striving to see which company could reach a fire earliest they came to striving to prevent each from getting to the fires at all. In some degree they were the cause of fires—when fate was kind, and conflagrations were too infrequent to please them. In this era was developed “the Bowery boy,” the queerest product of America in his day.

The Bowery boy began with more good than evil in his composition. In the daytime he worked for his living; at night he aimed only to be a dandy and a fireman. He sang negro melodies very prettily, danced well, was a devoted patron of the theater, and worshiped good women. But with the growth of the city he came to have his own way to a greater extent than was good for him, and his type grew worse and worse, until the Bowery often became a bloody battle-ground between the police and the ruffians that the Bowery boys had become. In time he became a drinking, fighting, and gambling character, with a modicum of the high principles and stern morality in heroic directions that we afterward found in some of Bret Harte’s Pacific Coast characters. Desirous of punching somebody at all times, he especially liked to punch persons who were rude or cruel to the female sex. He was intensely patriotic if he happened to be American, and it was in his time that Americanism, or Know-nothingism, was very rampant and bellicose. There are men alive to-day—old men, to be found at Washington Market or behind fast horses on “the Road”—who are given to wailing over the degeneracy of the times, and to boasting that they knew the day when the greatest prize-fighters and thugs and punchers were all true Americans!

The Bowery boy was very proud and full of an affectation of rough airs that he considered exquisite. He dyed his mustache jet-black, oiled his hair profusely, and was much given to loud perfume. He wore a lustrous silk hat, a flannel shirt with a huge black-silk scarf under its collar, trousers that were very tight and needed no suspenders, a coat that he usually carried on his arm, well-polished boots (not shoes); and carried a cigar tilted heavenward above his nose, and spread his elbows apart so that nobody could pass him on a narrow pavement without jostling him. Of course if any one jostled him he was insulted, and when he was insulted he fought. In the days of his glory he scorned to use any weapon but his fists. His voice was modeled after that of the fire-trumpet, and he had a language all his own. He called to his sweetheart, “Here, gal,” “Come, gal,” and when he wanted any one to hold the nozzle of a hose he said, “You, dere, take der butt.”

It is said that Thackeray much enjoyed meeting a Bowery boy. The great novelist desired to go to Houston street. He was not certain whether he was right in pursuing the direction he had taken, so he stepped up to one of these East-Side Adonises and said: “Sir, can I go to Houston street this way?”

“Yes, I guess yer kin, sonny,” said the boy—“if yer behave yerself.”

If you walk down the Bowery to-day you will see traces of all these eras except the Dutch, and that remains in the queer title of the street, as I have said. Though no other street shows such a blending of discordant qualities, it is yet true that no artery in the

town has yielded so slowly to the modernization that the rest of the city has undergone. It is true the elevated railway, of the original single-legged pattern, skirted each pavement, but it passes many and many an old-time New York dwelling the third story of which still consists of the old dormer windows piercing a tilted roof, which, with the slanting wooden cellar doors, were the characteristics of the best houses of the city fifty or sixty years ago. Farther down the street the railway passes two or three wooden houses of that earlier era when it was permitted to build with wood in down-town New York. It even passes over a mile-post bearing the legend, "1 mile from the City Hall." It rattles the windows in the old Bull's Head Tavern of Revolutionary times, and it keeps a-trembling more than one queer, crooked relic of the English days, like little Doyers street, which is also mainly wooden, and which, though only a couple of blocks long, turns and dodges in several directions like a thief eluding a policeman. It is not a nice street, and it looks as if it were doubling upon its own unsavory reputation.

The Bowery is something less than a mile in length. It reaches from Chatham Square to the little wedge in front of the Cooper Union at Eighth street which splits it in twain, sending one half up-town to be the great Third Avenue, and one half close beside it to be the Fourth Avenue. It has the width of both these wide avenues together. Its width varies, as becomes an ancient thoroughfare, but I think it averages more than one hundred feet from house-line to house-line, sixty-five feet being the roadway. If you are a stranger, and walk down the Bowery in the daytime without a guide, you will be apt to notice nothing more particular about it than that it is an enormous, crowded, noisy street of retail shops, lodging-houses, and museums. Any old New Yorker will show you some very old and respectable shops—notably a grocer's, a baker's, and a shop for the supply of firemen's goods—which were established there in the days of other generations. But these are not so interesting to a stranger as the many little stores that give a distinct character to the street. Except in the main street of Havre, I never saw so many shops for the sale of jewelry as there are on the Bowery. Most of them display

new, cheap, and flashy ornaments; half a dozen are what are called pawnbrokers' sales shops, or shops for the sale of unredeemed pledges; one is a mart for duplicated presents received by persons on their wedding-days, on anniversary occasions, or at Christmas.

The pawnbrokers' sales shops have held me before their windows many and many an hour since childhood, and to-day when I pause before one I feel a keener touch of the impulses of youth than anything else can bring back to me. There is much humbug in the Bowery, but there is no humbug in what these stores display. Pathos and tragedy are constantly exhibited and enacted on every block of that throbbing avenue, but it all seems to me as nothing beside the tragic and pathetic tales that are told by the goods in these store-fronts. The vanity of man is felt by every poor stranger who is knocked about and jostled by the crowds that throng the pavement; but for a sermon upon vanity I know no text in all New York like the contents of one of these windows.

* The very manner in which the dealers have shoveled the goods out for exhibition is im-

DOYERS STREET.

pressive. It is usually their rule to heap the bottoms of the windows a foot or two deep with the less showy and bulkier relics of misfortune, and then to display the more peculiar and tempting goods on swinging shelves hung close to the panes. Here you see medals presented for heroism in saving life or for bravery in battle, swords given to men for taking part in actions that are household words, badges

was only fancied, of vanity that toppled, or of applause that beckoned anguish.

Whether the taste for cheap jewelry is stronger with our adopted fellow-citizens than with ourselves I am not sure, but one sees the force of foreign inclination unmistakably in other features of the street. The frequency of signs painted with Hebrew characters in German words, even in the windows of the banks,

UPPER STORY OF THE THALIA THEATER. (FORMERLY THE OLD BOWERY.)

of bejeweled gold bearing the arms of petted militia regiments, all showing that their owners were once confident of fortune and yet must have come to desperate passes. A medal of silver to the best scholar in a great sectarian school, one of gold to the champion clog-dancer of Australia, a golden-headed malacca cane won by ———, the most popular police officer in ———, these call to the mind happy scenes that no one dreamed would have such forlorn sequences. But what of the scores of opera-glasses and bracelets engraved with such mottos as "To Laura on Christmas," or "Isabel," or "With J. M. F.'s love to Sadie"? Rings, bracelets, breastpins, jewels especially devised, and curios which no one would part with except from stern necessity, are in the heaps and on the shelves—literally in burden by the ton when you take them all together; and yet every article in the mass carries its sermon of happiness despoiled, of security that

is no more mistakable than the occasional "delicatessen" shops, as the Germans call those places which are nearly like our "fancy groceries." The number of places for the sale of musical instruments is so great as to indicate that the majority of their customers are from continental Europe, and in the still larger number of cheap photograph-galleries the same influence is apparent. To stop and examine the tintypes and *cartes-de-visite* displayed by the photographers is to carry yourself out of America at once. Not only are the types of faces mainly Teutonic and Slavonic, but the sitters have shown a very foreign fondness for being pictured in fancy costumes and maskers' dresses. They pose as kings and queens, as huntsmen, as Swiss and Polish and Magyar peasants, the matrons and maidens in very short skirts and the men in feathered caps and velvet knee-breeches. Those other men and women who are plainly dressed have kept their

hats and bonnets on more often than is customary elsewhere, and the babies appear to be victims of a strange rule which requires them to be photographed in nudity or the state closest to it. The source of the fancy costumes is seen in the many places for the hire of masquerade dresses that are in the Bowery and close beside it in the cross-streets, these places being always up one flight of stairs. The costumes are hired for use at masquerade-balls, and it is on the morning after such a ball, before the dresses are returned, that the dancers wear them once again in the photograph-galleries.

Dancing is almost as popular a form of dissipation with the people of the Bowery region as with the idlers of fashionable society, but the high rentals and the great space required for the amusement have limited the number of assembly-rooms to one on the main avenue, the dancers finding cheaper quarters in a score of halls near at hand in the side streets. The excuses that these adopted Americans make for associating together are so numerous that it is not at all an uncommon thing for a mechanic to belong to four or five associations of his countrymen, while the shopkeepers, wine-dealers, and politicians who have money to spare and popularity to win often belong to twenty, thirty, and in one case with which I am acquainted to eighty such organizations. The first society such a man must join is that of the people who hail from the same European village, or province, or principality. To such a club the women of each family belong by right and without charge. Next in order is either the singing society, or the sharpshooting club, both of which are almost certain to spring out of the first organization. Then come the branches or chapters of whatever secret societies or mutual-benefit leagues happen to have most attracted the men of that particular body or nationality. There may be half a dozen of these. After these there are neighborhood turn-verieins, or gymnastic clubs, the general associations for bringing men of each nationality together, in a few cases charity or church societies, and so on, until if a man who can afford it has no more clubs of his own to conquer, he is forced to join those that grow out of the union of men from some other city or province whence a friend has emigrated.

Fraternity and fun are at the bottom of all these organizations—a kind of fun we Anglo-Saxons are too stiff to enjoy, and a sort of vigorous and ostentatious fraternity that we do not see the necessity for as clearly as we should if we were, like these persons, beginning life anew among strangers in a foreign land. No matter what the aim or title of the organization, dancing and the drinking of wine or beer seem to us the main purposes of the members.

The so-called home clubs—of people of one district—exhibit the purest democracy that is possible, for they meet upon equal terms, although among the immigrants are well-to-do shopkeepers, educated professional men, poor mechanics, clerks, and a very human mixture of the shrewd, the shiftless, the industrious, the stupid, and the ambitious. I have known a wage-earner to be president or “king” over many men of considerable means and pretensions, and in that case the “queen” who sat beside the mechanic on the coronation day was the wife of an educated and prosperous man, the first or second in his profession in this country. The king was elected, but the queen got her crown by her marksmanship with an air-gun before a paper target. The only object of this society was to bring together the people from a Rhenish village for a grand dance and feast of new sausage and new wine once a year. Thus united, the men established a so-called sharpshooter’s club to make an excuse for another annual ball and as many days as possible of drinking in suburban picnic-grounds. They also established a singing club designed to furnish music at all gatherings, solemn, sad, or merry, and for another dance once a year.

I have accidentally run across many queer clubs among these foreigners, and have learned that there must be five hundred quite as peculiar of which I have never heard. Any excuse is employed for bringing their fellow-countrymen together. In one case a band called itself “The Pfaelzer Humorous Club,” and met around a table whenever a fine was to be paid. The fines were levied in this order: A keg of beer upon the birth of a son, the club tankard of beer (a splendid carved cup holding two quarts) on the birth of a girl, a glass all around for talking politics. If my readers were all New Yorkers I should not need, in parting with this phase of the life I am describing, to say that these clubs and people are nearly all respectable, orderly, industrious, and valuable citizens.

Merely in passing I spoke of the “lodging-houses” as notable features of the Bowery. They are almost peculiar to it. There must be a score of them. Invariably they occupy the upper stories of the larger and newer buildings along the huge and swarming thoroughfare, and therefore passengers in the elevated cars get the clearest idea of their interiors. From the pavement all that is seen of them are their signs, which read about like this:

EAST SIDE HOUSE.
FOR GENTLEMEN ONLY.
Rooms, 15 cents.

or

AMERICA HOTEL.
LODGINGS FOR MEN ONLY.
Nice Rooms, 25 cents.

DRAWN BY A. CASTAGNE.

THE BOWERY FROM THE GRAND STREET STATION OF THE ELEVATED RAILWAY.

ENGRAVED BY H. DAVIDSON.

Within recent years these have multiplied to such an extent as to bring about a keen competition, and he who runs may read the force of this in single lines that have been added to many of the signs. These addenda all indicate a general desire to do more than supply mere rooms as of old. "Baths free of charge," is the announcement of one landlord; "Reductions by the week," another offers; "A Cup of Good Coffee served Mornings to Each Lodger," says a third. As you look into each house from the Elevated Railway you invariably see a large assembly-room, bare-walled but clean, and set with tables and chairs. There is no hour of the day when there are not many men in each room, some merely lounging in the chairs, some reading papers, some playing dominoes, and nearly all smoking. In passing some of these lodgings a glimpse is had of bedrooms which rent for a quarter of a dollar a night with a cup of coffee gratis. They are mere closets made by running partitions up five feet apart from the floor to the ceiling. Each contains a cot, and sometimes a chair. There is no appurtenance for anything except sleeping, a common wash-room being elsewhere provided. The men one sees in these places are nearly all young, mainly at the threshold of manhood. It is a general impression that they are either criminals or hardened characters, and though I am certain this does them injustice, I have never been able to satisfy myself to what extent they are injured by the suspicion. That there are among them many petty thieves and parasites who live upon outcast women is certainly true, and I suspect it requires great strength of character for a poor, stranded victim of circumstances who drifts into one of these places to resist the overtures that come to him from such wretches. Yet I know that many a poor huckster and sober wage-earner who has only a bare foothold in the town is obliged to put up at these lodging-houses, and it stands to reason that in the course of every year thousands of decent, ambitious strangers who come to the great city to make a living or a fortune must perforce begin their new career in these honeycombs. Now and then such a man shoots himself in one of these places or throws himself out of the window upon the pavement below.

By the way, it would not be easy to make most readers believe how trifling a thing a suicide is in the Bowery. It is not because there are so very many, since death's harvest by that means does not exceed two hundred and forty a year throughout the whole city, but it is rather on account of the preoccupation of the people and the summary action of the authorities. The shot is heard by very few. Neighbors of long standing do not know one another, so

that the persons in the house where the death occurs deal only with the authorities, and no one spreads the news along the block. An ambulance calls for the body, and then there is the greatest stir, for a knot of idlers always gathers to find out what called the ambulance. The little crowd collects, and hides what is brought out of the house. The average busy New Yorker feels no interest at all in the matter, for it is his life habit to avoid crowds. The ambulance drives away, and it is not until they read the papers next day that the people on the very block on which the tragedy occurred become aware that it took place.

Three notable Bowery institutions that attract attention in the daytime have not been mentioned. They are the drinking-places, the dime museums, and the eating-houses. It will seem like an exaggeration, but I carefully counted them before I put down the number of places in which liquor is sold on the ground floors, alone, of the buildings along the Bowery. There are eighty-two such places, or nearly six to every block. The street is fourteen blocks long, and there are sixty-five places where drink is sold on its east side and seventeen on its west side. As there are five blocks on the west side of the street on which no such places occur, the reader can imagine how thick the bars must be on other blocks. This total number includes four music-halls, as many restaurants and oyster-houses where bottled beverages are sold, two or three wine-houses, one wholesale liquor-store, and the bars connected with several theaters and variety-halls. Some of the saloons have glittering exteriors and costly fittings, but not one is of the so-called first class. In the main they are cheap places of a low class, the number of them being so great as to reduce the profits to a minimum. A few staid and respectable German places are in the number, and one orderly resort—the Atlantic Garden—boasts one of the most profitable bars in a city where there are single counters over which \$500 is passed every day in exchange for drinks. Lager beer is of course the standard tipple of the Bowery, and it flows there in such torrents that I am not guilty of the slightest exaggeration in saying that early on Sunday morning, after a busy Saturday night, the very air that is breathed in the great avenue is weighted with the odor of soured beer.

The eating-houses are not nearly so numerous, though their comparison with the drinking-saloons is greater than the proportion of bread to sack which Falstaff deemed sufficient. The lodging-houses support many restaurants, and as the Bowery is a principal artery, the transient trade in food is sufficient to maintain as many more. Again competition shows its paring hand, for in front of some of the eating-houses

one sees announcements that "large portions" of roast beef, mutton, lamb, pork, and veal are offered at eight cents, with bread and potatoes thrown in. Ten cents is the standard price for such provision, and, since milk, coffee, and tea are usually sold at five cents, it is possible to purchase a solid and nutritious meal for a dime and a half. A moment's calculation shows, therefore, that a man may eat and lodge in the Bowery with a good bed and three meals a day for \$4.90 a week, and with a fifteen-cent bed and eight-cent dishes for \$2.73 a week.

It sometimes seems to me that there is no avenue of profit or of commerce that is so illuminated by genius as the Bowery museum business. If ingenuity be a form of genius, there cannot be any doubt that I am right. A few visits to these resorts will satisfy the more intelligent citizens, and the visits will naturally be paid in early youth. But the populace as a whole is not characterized by the greater degrees of intelligence, and it is surprising to note how skilfully the managers of these places keep astir the ready curiosity of the mob. As much color and oil as have distinguished the galleries of the Louvre have been spent upon the huge canvases that all but cover the museum buildings. Sometimes the garish signs and pictures completely conceal the façades of the building and block up the windows, it having been found that many of the wonders on exhibition suffer less by gaslight than by the blaze of day. A museum is fairly started when it has a mass of gorgeous paintings, a tout, or crier, at the door, a ticket-taker in the lobby, and a band of three musicians limping, squeaking, and pounding just within the inclosure. I have known little of the interiors within recent years, but I see the signs frequently, and I have observed the progress that has been accomplished in the science of museum management since my boyhood days. The "fattest woman on earth" was sufficient in that era, but now she is represented twice as fat as of old, and yet dancing like a fay. There is most ingenious "faking" (the museum term for humbug) as of old, but there is also much reality—real "heroes" of trips over Niagara in barrels, of the bridge-jumping mania, of criminal life, and of distorted natural history. The more pretentious of these museums are so conducted that the only advantage that is ever taken of a stranger lies in the presumption that he will believe what he hears and credit what he sees. Yet in at least two of the six museums which illuminate the Bowery a fool or a too trustful stranger will be certain to be robbed. The tricks by which such persons are despoiled of their money are as old as sin itself, yet age does not wither nor custom stale a single one. An example of the dark ways

of the robbers who lurk in these dens is this: Within one of the lower class of museums the visitor will notice a door through which he is invited to pass in order to have his cranium examined by a phrenologist, and to receive a present of a chart setting forth his proclivities and possibilities. Within is a room, a chair, and the alleged phrenologist. The visitor notices that the walls are bare; at least he perceives nothing to interest him as he glances around him. But just as the phrenological inspection is finished, a click is heard, a piece of a partition falls down upon a set of hinges, and the victim reads, "Professor Blinkum's charge is \$2." If the victim is wise he will pay the fee; it will be cheaper than the drubbing and perhaps the actual robbery by violence to which he must otherwise submit.

The museums are brilliant at night, and it is then that the Bowery becomes newly and doubly interesting. It is probably the most brilliantly lighted thoroughfare on this planet. The money spent in lighting it is prodigious; the illumination is prodigal; the effect is dazzling. But the method adopted for this lighting is cheap and vulgar, and emphasizes the popular meaning which the word "Bowery" has taken on. The English word "brummagem" fails to convey half the definition of the term "Bowery." The words lean in the same direction, but to be Bowery is to be twice what is meant when we say a thing is brummagem. Whatever has the Bowery stamp is not merely an imitation, but it is a loud and offensive falsity. In New York, when the people see a great glass stud, cut to look like a diamond worth \$10,000, and worn on the shirt of a store clerk, they call it a Bowery jewel, and they say of the man that he looks very Bowery. The extremes of fashion are caricatured and intensified in the Bowery, where the cut of men's trousers, the size of plaid patterns, the shape and style of the shoes, the gorgeousness of the waistcoats worn by the mock dandies—not to speak of the swagger and swing of the East Side belles—often surpass endurance if not belief. A Bowery dude is constitutionally unable to put on his hat unless he may balance it on one ear. It suits the street, therefore, to boast the most brilliant illumination of the coarsest and most dazzling sort.

I counted its surplus lights the other night,—the mere electric arc-lights which dangle before the stores and resorts,—and I found that they numbered 263. On the west side there were 189, and on the east side 74, or, altogether, about 19 to each block. The arc-light is that variety of electric lamp which is produced between two thick carbon-pencils inclosed in a great cocoanut-shaped shell of

glass. Let the reader who is familiar with this added burden upon human existence, this ingenious instrument of torture, fancy, if he can, the hissing and sputtering, the lightning-like starts and jumps, the alternating flashes and depressions that the glare of the Bowery undergoes. A tour of this street by night is a never-to-be-forgotten experience, but in the main the street is like a great electric lantern. It is the most brilliant eye in the Argus head of New York, and it is the eye that never sleeps; for when the rest of the town is dim, and its bustle is all but hushed, the eye of the Bowery looks out into the night with a gleaming stare that only the rising of the sun is able to intimidate.

The great wholesale houses have closed, but the people of a vast network of streets walled with high tenements have come home from work, have supped, and are out on the Bowery for the night's shopping, amusement, or exercise. The sidewalks are almost packed with people bathed in the brilliant light of such a number and variety of shops as are not to be found in any other equal area in the city. But the outcasts of society are in the throng; the tenth of the town that lives by night is astir. Poor creatures, indeed, are these Bowery miscreants—the product of that same tenement region where, a careful missionary says, one hundred thousand persons have moved in and fourteen churches have moved out within the past ten years. The criminals found in the Bowery are of the stunted, half-starved type of which the tenement house is the matrix. Undersized, wizen-faced, aged while yet of tender years, little-eyed, cunning, shabbily dressed and constantly hunted, they are rather like human rats than men and women. Their haunts are in the cellars, the rum-shops, and in the disorderly places on upper floors—for it is a peculiar fact that not only does the Bowery contain liquor-stores side by side in places, but it contains rows of buildings in which every floor is given over to disreputable uses. I shall not dwell upon that phase of the Bowery life except to answer the question that is asked of every citizen by every stranger who is curious to visit that quarter—"Is it safe?" It is. Better than that, it is worth while. It is not well for a lady to walk out alone in any part of the city at night. Yet a woman without an escort, walking briskly along, is less likely to be affronted on the Bowery than on Fifth Avenue, by day or by night. There is one rule for escaping annoyance in New York city. It is the same for women as for men. That is to walk straight along without stopping or staring. It is the gawk, the gaby, the idler, and the over-curious meddler who invites insult and annoyance.

By half-past nine o'clock the shopping-places have closed, and the fourfold procession of

shoppers has come to an end. The last family group, headed by the husband, with the wife a step behind him, and her babies trailing after her, each clutching the other's clothing, has been swallowed up by the darkness of the side streets. The Bowery now belongs to the seekers of recreation and of vice. They are moving in and out of the museums, the gin-shops, the concert-halls, and the theaters. They have the choice of ninety-nine such places. Seven of these are theaters, six are museums, and four are music-halls.

The English theaters (or American theaters in which English is spoken) are what are called "gallery-houses"; that is to say, the gallery forms the most important if not the largest part of each. To enter certain ones costs only ten cents, and fifty cents secures an orchestra chair. In two, which are handsome theaters, the best plays and nearly the best companies are seen. They are operated as the theaters of small cities are, being considered as part of the provincial circuits to which New York successes are sent after their runs in first-class up-town houses. But the other English theaters are for the exhibition of variety-shows, or music-hall performances. What has always interested me most about them is the fact that they attract the newsboys and street Arabs with irresistible magnetism. The average New York newsboy, when he counts the cost of a day's living, includes ten cents for "de tee-ater" as regularly as he figures upon the amount for lodgings and for his three meals of "beef and beans." As there are thousands of these boys, the number that have earned the price of a gallery-seat is very great each night, and in consequence the strife for an early choice of seats is vigorous. The result is that the ragged little shavers form a line long before the theater doors are opened, and this line grows, and lengthens, and tails along the sidewalk until it makes what would be a notable picture for a Mrs. Stanley to fix upon her canvas. There are fights now and then in the line, and a babel of cries and whistles and shouts goes out from it. When the doors are opened the rush up the theater stairs is like a mountain freshet reversed. Like stampeding cattle the boys fling themselves down the aisles and over the seats until there is not a vacant place left. Then they take their coats off and fold them in their laps, and the air fills with the aroma and crackle of peanuts. Monitors, with long ratans and uncommonly bad tempers, endeavor to keep the little savages in some sort of order, and it is to these guardians that reference is made in the frequently repeated cry of "Cheese it! de post!" There is no time here for a study of that queer sentence. "Cheese it" is the warning cry of the New York street-boy, and

though many have guessed at it, I have never known any one who was able to give its derivation. "The post" is the monitor, but why he is called a post in a Bowery theater, and nowhere else, some one else must explain.

The most peculiar of all the theaters in the country are two that are on the Bowery. They are the Polish Hebrew playhouses. The old Bowery Theater was recently given over to that use. There are 37,000 persons who call themselves, or are called, Poles, and who live clan-nishly in a little strip consisting of a few blocks to the east of the Bowery. It is one of the most densely populated parts of New York, for they crowd together, and, being poor, live meanly. Eight tenths of them are Hebrews, and they constitute not much less than half the Hebrew population in New York. As a matter of fact, they hail from Russia, Austria, and Germany, and are of the type and class that aroused our sympathies some years ago when a very large number came here, leading a great exodus caused by outrageous persecution. They contradict many ideas about the Hebrews that have been strongly held among us. They are not rich. They by no means eschew manual labor, nor do they show remarkable genius in trading, for they work at the making of clothing and in other lines that are laborious and poorly paid. Furthermore,—and this is merely my own judgment,—they are not especially prudent or thrifty. They crowd their two theaters, where the plays—at least all that I have read the names of—are based upon biblical or historical subjects, or upon scenes local to New York. They have a drama of their own, and it embraces a great number of plays, but in the Bowery these are altered and lengthened by the introduction of scenes not always strictly connected with the pieces in which they are inserted, and never of the high standard of the original works. Their local plays, usually picturing the adventures of a Polish Hebrew who reaches New York, and starts out upon the streets as a peddler, are of the lightest possible character. In one theater one of the actors is the playwright. The talents of the players vary, some being very clever, born actors, and some being very wooden. The language used on the stage is a strange jargon of bad Russian, Polish, old Hebrew, and one or more other tongues. The programs are printed in Hebrew characters.

It is an interesting sight to see one of their theaters when an attractive play is offered. Almost all the men are tall and spare, with their long black locks unbarbered, and their long black beards uncut. Those who are near middle life are apt to be bent and pallid, with sunken cheeks and hollow eyes, as if they lacked the comforts of life, needed nutritious

food, and had worked and suffered prodigiously. Their faces are distinctly Slavonic. The women are all heavier and stouter than the men, some being fat, and many plump. Very often the matrons wear well-used, coarse, and undeceptive black wigs. Red shawls are a peculiarity of their attire. The young girls have the rare complexion of the Hebrew girl everywhere, and many of them are beautiful. Never were more orderly congregations than these theater audiences. Talking, or interruptions of noise, or disorder are always hissed down. It is evident that these people enjoy music, and their music is most peculiar. It is pretty, very simple, and extremely pathetic, even funereal at times. It always reminds me of the weird and sympathetic tones of the typical Hungarian melodies; but the triumphant, strenuous, heroic element which completes the Hungarian music is not heard in these Hebrew tunes.

More numerous than all others on this great East-Side parade are the people of German origin. There is little about them that is peculiar to us, but they maintain one notable resort, which is known and almost familiar wherever German is spoken. It is the largest of the beer-saloons—the Atlantic Garden. It is not only the resort of the Bowery Germans, but it is the rendezvous for the officers and crews of all the German vessels that come to the port, and for a great many German tourists and travelers who are passing through the country. It is thoroughly German, from the dishes served on the counter near the door to the music played by the orchestra within, or the well-salted pretzels that are consumed with the beer. It is simply a large hall a block in depth, partly surrounded by a gallery, and set with chairs and tables. Its decorations are neither good, bad, nor costly. Its purpose is to afford a place in which an hour can be passed in talking, drinking beer, and listening to the music of a band by night, and of a huge orchestration by day. The band is usually composed of a dozen well-trained young women, dressed neatly, all alike, and as women would appear at a high-class musical entertainment. Breaking the music of this band a balladist or serio-comic singer appears at intervals during the evening. Disorder is almost unknown. Women and children accompany husbands and fathers, and the drinking is performed with a dispassionate, thoroughly European regard for temperance and economy. A glass of beer is made to last a very long time there, and consequently to yield as much refreshment as half a dozen glasses taken as New Yorkers are apt to drink it.

A large body of Hungarians also claim the Bowery as their parade, and as this is written

they are holding a fair there. Two blocks away is "Chinatown," with its swinging lanterns and picturesque bannerets, and with its slippered figures tripping noiselessly about. Quite as near in another direction is the seat of the Italian colony — a street of towering tenements, apparently so crowded that the tenants can find room in them only while lying down, for in the daytime, when all are awake, the houses are swarming, and the sidewalks are all but choked with men, women, and children. However, though these people are in its region, they own no haunt or foothold in the Bowery, and therefore are not eligible to notice in this article.

In parting with the subject, let me add that the survival of the ancient "true American" spirit (always suspicious of danger to the Republic and always belligerent) still leads some good citizens to harbor deep suspicions of all that the Bowery typifies. They tremble lest foreigners, in numbers sufficiently great to maintain Old World customs, should endanger the existence of our own institutions. I do not

read any danger in any feature that makes up the Bowery except in its vices, and they are human rather than peculiar to any nationality. The "true Americans" of the first half of the century were themselves the offspring of foreigners, and so, by no greater removes, are many of those who now carry forward the old patriotism. That is, in some degree, true of all of us except the red men, but it is especially true of New Yorkers. This city has always been an open door to foreign immigrants, and lately it has been their principal gateway. A few always linger here at the threshold of the New World, and, being thrown together again, establish so-called colonies or foreign quarters. Therefore we have the Bowery as it is. It does not offer any new problem or confront us with an unfamiliar condition. For more than two centuries the city's population has contained a very considerable admixture of persons foreign to those who have ruled it, and at times some of the new blood has been far less desirable than any considerable element which we are now taking into the national system.

Julian Ralph.

THE LONG AGO.

WHAT was it made the Long Ago?
 Not summer sunshine, nor autumn rain;
 Not sweet spring budding, nor winter snow,
 Nor still blithe pleasure, nor yet keen pain.

For sure as the years roll round they bring
 Their seasons, fair as the ones of yore.
 But only robbed of that nameless thing
 That Long Ago in its bosom bore.

I know not why I should mourn it so;
 My love of to-day is more strong and true,
 And the love of the distant Long Ago
 Had died ere ever it fullness knew.

But still I yearn as one yearns who lost
 A new-born babe in an earlier time,
 Before these lads, with their locks uptost,
 Were strong to clamber, and brave to climb.

It comes to me oft when I sit apart,
 This tender want for — I do not know;
 It has no place in the Present's heart;
 It only lives in the Long Ago.

Julie M. Lippmann.

CHILDHOOD.

R. STEVENSON thinks that dogs suffer in reputation from intemperate and undeserving eulogy, and in one of his refreshing essays he comes, Carlyle fashion, "as one solitary individual," to their defense, and sets forth their winning weaknesses, their vanities, resentments, jealousies, and caprices.

I wish to imitate his chivalry by defending children from their self-announced friends, and the blessed Christmas-time is certainly a season stimulating to such an effort, so royally is it their festival the world over, and so persistently does the sentimentalist do what he can to deprave it—and them, and to put an end to our fondness for both; and though, to be sure, his success must always be slight enough, it is a pleasure to combat him. Sentimentality has falsified children even more odiously than dogs. Theatrical heroics are more interesting than a dead level of featureless sweetness, and do not misinterpret doghood by such a gulf as is fixed between life and the tradition in this other case.

Truth is not only stranger than fiction, it is also vastly more pleasing and entertaining than the essentially fictitious. The race finally concludes that the comparatively dim Corot is a more gratifying work of art than the landscape of the dime-museum sign-painter in all the splendor of unalloyed blue, green, and orange; and in the metaphysical world as well, it is a moment dangerous to beauty, to health, to sanity, when we set up ideals that are quite divorced from reality. Children are not so white as they are painted, but they give the normal color-loving eye much more delight than if they were.

Not only their moral but their mental qualities are perverted by hearsay and magnified into the monstrous. Who would not feel a terror akin to hate of the infant human being, if he were, for instance, any such infallible judge of character as the sentimentalists continually declare him? Thank God, the facts show that he is no such thing. Perhaps it is perversity that inclines me to put gullibility first among the charms of childhood, but surely its place is not far down the list.

The ability to read people is rare and slight in any class. Shakspeare seems to have failed in so crucial a test as the choice of a wife, and after that the rest of us should be content to

let any happy conjunctions in our intercourse with our kind be accredited to fate, and not pretend to be judges of human nature—what it seems, indeed, no one is or can be, so unaccountable is the compound.

As to children, they are exactly what the scientific thinker would expect from *a priori* reasoning, their perceptions are undeveloped by experience, their vanity is unchecked by the slings and arrows of outrageous fortune, and our usual standard of judgment, personal gratification, is with them unusually unqualified by any shadow of other considerations. All our lives long we pay so heavily for this universal short-sightedness that it is surely only fair that we should get some innocent pleasure from the exaggerated form of it we find in children. And indeed we may, if we find it pleasant to be loved; it is always open to every person, without the least regard to morals, to gather from their ranks an ardent company of worshipers. Moreover, so far have the sentimentalists worked to the advantage of the vain, that the man or woman who is the object of children's love is assured a special, half-superstitious regard from their elders—not only from their parents, whose softness goes without saying, but from entire communities, from passing car-drivers, and cynical old gentlemen at club windows.

To love children is certainly an amiable human trait, as is a desire to look pretty, or a fondness for using a nice voice; all these things show degrees of good taste, and a kindness to others, not divorced from a pleasing readiness to be flattered; for of course the wish to be loved by them is one with the love of children. The high qualities of moral heroism and lofty idealism are not necessarily much more involved in the one case than in the other.

Yet so deep and general is the conviction that the love of children is an angelic trait, that I myself have had the bitter-sweet experience of receiving an extra meed of regard from my own family, who have had of course a long experience of my many stern virtues, simply because one summer I made myself the idol of all the four-year-olds in the village. My motive was very simple: overworked eyes and an absence of society threw my time on my hands, and in no other way, under the circumstances, could I get so much entertainment—nothing surely, for one thing, being so entertaining as adoration; and putting adorations with adorations, none other (I speak, it is true,

from a highly limited experience) is so flattering as a child's.

I may reason here in a cold-blooded way as to the moral non-significance of children's favor, but "saying aught we leave a world unsaid," and if in the beginning their preference indicates no special moral superiority, it certainly encourages desirable emotions of benevolence and tenderness, and these are so agreeable to their possessor that he feels that he is indeed angelically touched—a state of things not only pleasant but undoubtedly often salutary. Undeniably, too, these conquests have the solid charm of unmistakable success. In other things one waits long for even a degree of triumph, as in attempting an art, or one is perhaps never confident of the exact quality of his good fortune, as when a rich old gentleman marries a poor girl; but with children you are unquestionably assured of your own pleasantness when they are pleased.

Do not infer from this that I go with the sentimentalists as to the sincerity of childhood. Not a bit of it. Children are sincere enough when it is for their comfort, just as you would be if you dared, and in their regal indifference to incomes derived from the retail-grocery trade or the practice of medicine, have no mind to allow themselves to be bored; but for shameless play-acting, who can surpass your ten-months-old daughter, when, sitting on her mother's lap, her piteous wails ascending to heaven, she expresses, seemingly with flowing fountains of tears, her desire to possess your watch or to be tossed in your arms, but who, having gained her purpose, removes her knuckles from her eyes and opens them upon you in tearless luster? Practice does not yet enable her to command tears after the manner of Cleopatra and other ladies, but she does the best she can, and imitates the sounds and movements of weeping very creditably. She may look a little conscious of the perfunctory nature of the performance when it is over, and give you the benefit of her eyelashes as she scans you askance to see what you think of it, but there is more pride than humility in that part of the performance, and she evidently has no real doubt of the fact that it is all very charming—and neither have you.

The duplicity of children becomes more complex than this. I hesitate to lay an exceptionally sincere woman (of her qualities I speak with authority) open to the doubts certain to assail her candor, were I to tell her friends the story of the little red book; but here, with a nameless heroine, let it illustrate my point. She does not know how old she was when she endeavored to make the little red book an instrument of vengeance, but at least her legs did not bend over the edge of the chair;

she has a vivid recollection of them sticking straight out in front of her, as she sat, book in hand, shedding bitter tears over some maternal chastisement. What chastisement, for what offense, is all forgotten, but there she was, and a sense of cruelty and injustice was burning in her soul. As she pondered her wrongs she thought she saw a way to transfer some of the smart of that hour to the far future of her oppressor. She adjusted that little red book, bent her designing noddle over it, and dropped upon it several big tears—how big you can see by the startling size of the white blotches on the faded cover to-day. Her clearly defined idea was that her mother would surely feel remorse strike home to her when in after years she should see that tear-stained volume. The stern parent was quite unsoftened by its pathos at the time, but, happening to see property thus endangered, took it summarily away, and left her daughter to stare, at very close quarters, at her own toes, without the relief of literature. But indeed I think the scheme was well considered, and that, despite all subsequent exposure of its methods, the mother cannot now see those white blotches without a slight pang—the tears fell from such a very little weeper!

Ah, there is the great point, the first and the last, in considering the charms of children—they are such little things! We ascribe to them the virtues we feel we ought to admire because in any case our hearts are so tender to such helplessness.

There is something suggestive and consoling in the gentleness of our judgments of children. They do not have it for one another. It comes with the sense of overwhelmingly dominating power, and if we permit ourselves that degree of anthropomorphism necessary to any coherent reflection upon God, we may please ourselves with the thought of how blessedly minute and touchingly good-for-nothing we must be to the infinite vision. It perhaps approximates some truth, and what more could be said for dogmas that have cost rivers of blood!

The Christian religion certainly teaches us to think those happy who have only to be forgiven for faults akin to those we minimize in children as "childish." "Except ye . . . become as little children?" To my mind it is not at all as if the text said, "Except ye become perfect," or "Except ye become as the angels."

Children are not often angelic, though there is a divine light about them, of which I have not yet taken sufficient account, which, often against the most patent evidence of their earthliness, makes us feel them so. They are earthly, but they are not normally worldly. That is a word of deep significance; it is the true antithesis of childlike; and all the moral superiority

that we can truly claim for children is that they are not world-stained. In which reflections lie some queer comments on the structure of our customary moral codes. It is the faults of hardness, of diseased vanity, of calculated self-seeking, of self-righteousness and of bitter judgments, and not smaller matters, such as lying and stealing and undisciplined appetites, that keep us from being as little children. Far be it from me, who am a citizen with business interests, to call these latter offenses small, nor can I suppose such childish offenders ready for the kingdom of heaven; but according to the standards of the New Testament we must admit that they are in a more hopeful state than the typical Scribe and Pharisee. There is no reason for supposing that becoming as a little child completes the work of grace, but it is stated as an essential preliminary. Whatever your standards, you assuredly must often feel how much more troublesome is pharisaical virtue than publican vice, how much more insidious and difficult to deal with. But this is a groan from an overcharged heart, and has nothing to do with the subject.

As there is nothing in our judgments of children to differentiate them from our decisions upon one another, except the clear-sightedness that comes from overlooking them, and the fairness and generosity resulting from a comfortable assurance that we are beyond their competition, it is instructive to observe that we apply to them something like Christian standards, finding offensive in them meannesses and coldnesses which are hardly reckoned in when we are deliberately estimating the moral worth of our peers; and correspondingly we are complacent toward such deflections as we are taught to condemn most severely in one another. No one hates a child for stealing sugar, but who could forgive him, even though he obtained his sweets in the most regular manner, if he habitually devoted them to knowing commercial speculations made at the expense of more eager and trusting infants?

And indeed, as to our condemnations and approvals of the grown-up world, if we are of the happy and right-minded majority who keep a proper distance between theory and practice, despite our consciences we continue to choose the society of many a kindly reprobate in preference to that of some highly respectable vestryman who demands continual tribute to his self-love, and has about as much sympathy as a chess-automaton. We are content to give him our verbal approval, and, against our opinion, we go in practice with Jesus of Nazareth, and seek the more childlike companionship. Happy is the generation that has had the beauty of childlikeness painted for it by Jefferson's "Rip Van Winkle," and it is reas-

suring to remember that the preachers and the pious in general have approved that work of art; yet, still, many a young reasoner, arguing from accepted standards, must often wonder why, and, as with tears and laughter he sees the ever-recurring failure of dear Rip's good resolutions, must bless what seems to him a puzzling lack of logic. But the application of these Christian standards to moral codes is too delicate a business for the workaday world. It is hopeless at present to devise a penal code for the unchildlike (the groan for which I apologized a moment since as not germane to the subject has, after all, its place here), but it is a step toward that distant reform to study from life, not merely from hearsay, what children really are.

I find in them a mental superiority perhaps more marked than their moral distinction, if you will permit, for the sake of convenience, this arbitrary and superficial separation of the inseparable. The most telling fact for pessimism that I see is the demoralizing effect of life upon—must I say most people? At any rate, it is a question whether the majority benefit by their experience of this world; if they do, why should the word worldly have such dire significance?

The decline in nobility between twenty and forty is a standing subject of sorrow to the judicious, but surely it often begins long before, and from the first it is a mental as well as a moral degradation.

The little children of the race are intellectually more respectable than the majority of its adults. To be sure, it is their attitude and not their achievements that makes them so; but in estimating the human being as a mind rather than as "a screw in the social machine," who can help thinking the attitude more important than the achievement? The abounding intellectual curiosity of children, and their continual return to the biggest and deepest questions,—the origin of things, the sources and ends of being,—these are what make them superior. What if the questions can never be absolutely answered? Is it not infinitely more respectable to have them earnestly in mind than, accepting some mumbo-jumbo reply, to dismiss them altogether and to devote existence wholly to the frivolities we call business, or pleasure, or learning? What else was Carlyle's fundamental *raison d'être* but his power to recall us to a degree of the serious reasonable wonder with which we start in life?

Upon my word, I sometimes think that if the world were started now on a new plan, and peopled altogether with the middle-aged, religions, after going on a short time through the impetus of custom, would die out all over the world from this simple lack of interest in the questions they primarily undertake to an-

MOTHER AND CHILD, BY ABBOTT H. THAYER.

swer. As it is, the children force us to keep some sort of theory of existence furbished up.

Perhaps it is the seriousness of its interests that invests childhood with the mysterious, evanescent, exquisite beauty Wordsworth had in mind when he wrote:

The Soul that rises with us, our life's Star,
Hath had elsewhere its setting, and cometh from
afar:
Not in entire forgetfulness, and not in utter naked-
ness,
But trailing clouds of glory do we come
From God, who is our home.

The haunting charm of these lines is not the result of their doctrine, but results from a statement of it that subtly suggests this nameless other-world loveliness. Neither does my rashly ventured explanation explain—or, at most, it goes a very little way. We simply do not know what gives childhood such divine aspects. The fact is one of those grateful, poetical phenomena, of which the world happily contains several, that turn the edge of scientific explanations as the ambient air of some enchanted chamber in a fairy story resists Damascus blades.

Of course, in this case, it is left to the skeptical simply to deny this supreme grace to the miniature human being, and the candid observer must admit that children are touched with it in widely varying degrees. Nevertheless, if you wish, you will probably not need to go far to find a little child to sit in the midst of these scoffers, the sight of whom will simply shut their mouths with shame. With all the immortal pictures of the Christ-child in the world, I have never seen one that so echoed the special ineffable loveliness of soul peculiar to ideal childhood as does a baby, sitting on the mother's lap, painted by Mr. Abbott H. Thayer, and first exhibited several years ago by the Society of American Artists. There was at that time among painters a good deal of discussion—a fact in itself flattering—of Mr. Thayer's technical methods and achievements; any one who sympathizes with the painter's point of view in this picture must find that its technic achieves the one great success—that it pictorially, happily, and subtly expresses his feeling for his subject. The sight of it brings over one afresh the sense of the unfathomable miracles of the painter's art—that mortal man can so infuse matter with spirit, and bend materials so stubborn to ends so exquisite. This

child has the light of heaven in its face, the light of heaven just fading before growing wonder at this strange world, and faintly shadowed by a timid shrinking from its unknown ways that melts the heart with its pathos and its beauty.

Rare as this perfect flowering of the human being must always be, I have seen the same look on one little face after another throughout my life, and its significance passes beyond the range of our reason's conscious grasp. It is a portent and a wonder, and sings songs to the soul no words will ever say.

The fact that so many of us, like Mr. Wegg, decline and fall pretty steadily through life, tells for pessimism, but it is still overbalanced by the optimistic sign given us in the spiritual height from which some of us start; and this sign is none the less impressive for being so mysterious. I do not allow myself to be cast down because these angel faces are often borne by babies who need spanking much oftener than they are likely to get it, for there is a great deal in the richest ore besides gold; but, I admit, it is sadly depressing to see so many children who give little sign of a birthright of grace. How can any one declare he adores them in the lump, after the sentimental manner, when the very infant in arms so often shows a soul-sickening, self-evident likeness to an aggressive, stupid father, or a sharp, vulgar little fool of a mother? Still I believe the case is not then so bad as it looks to the casual but sensitive observer. A wise woman tells me that it is not the sheer fatuity of folly that enchants people with the most unprepossessing young one when it happens to be their own, but that truly it is only its own family who can ever really know a baby's charms, and it is her belief that if we could have all the evidence before us in even the most unaccountable case, we should see that the worshipers were wiser than the scoffing world.

We all know that the tiresomest brat can present wonderfully appealing aspects—say when only the little back is seen, and its sleepy wee head has fallen trustfully on a grown-up shoulder. Science may account for the pull the sight makes on your heart-strings, but in some way, after you have duly informed yourself as to the evolution of the emotions, it is still apt in experience, like childhood's own gaze, to carry tidings to your deeper, perhaps all but unconscious, self of precious undiscovered possessions and kinships in the universal sources.

Viola Roseboro'.

HOLY NIGHT. BY FRITZ VON UHDE.

THE OCEAN FROM REAL LIFE.

AM now gray with age, and looking back over the eventful career of my life, am impressed with the adage, "An old man for counsel, but a young man for action."

The scene of my story lies in real life,—my own experience on a homeward voyage, from the coast of New Guinea in the Western Pacific Ocean to New Bedford, where my ship, the bark *Brewster*, belonged, and whence we had sailed now twenty-one months before. The usual incidents and vicissitudes of so long a voyage in the whaling business had been mine to meet. With a difficult set of officers to govern, the factor of good fortune in my enterprise had helped me out. Meeting whales off the north coast of New Guinea, we had been obliged to discharge all our surplus provisions and fresh water into the ocean, to make room for the sperm oil, which was then worth in the American markets \$2.65 per gallon. I well remember the seeming wasteful sight, as we turned the forty-six-inch casks of hand-packed biscuit, one after the other, into the smooth sea. The biscuits will not float one on top of another, and the contents of each cask would cover nearly an acre in area. It was a novel sight to look upon. The molasses went down to sweeten the home of the squid and the octopus, while the salt beef and pork, flour, etc., became food for sharks. Eagerly we battled with the whales. They stove our boats; we rebuilt them, and continued the fight till at last we had a full cargo of oil.

So near had we measured our need for water that we had barely enough to last us to an anchorage, where we obtained a supply. I

must not stop to speak of the pure character of the German missionaries we found located in New Guinea, or the strange habits and simplicity of the primitive man. It would make a long story in itself, and I must take a departure on our eventful homeward voyage. Passing the Yowl Islands, then through the Gilolo Passage (which is a public highway for sailing ships *en route* for China and Japan), we entered the Dammer Strait, and the following day came out into the Molucca Passage, where we saw two New Bedford whalers, from one of which we received our first letters from home, written five months before. The next morning we saw whales, and captured a small one while in sight of the ships, which was vexatious no doubt to them with the ill luck they were having. Signaling a good-by to them as soon as the whale was cut in, we made sail to the west toward home, passing the Xulla Islands, and through the Bourou Sea. In ten days we arrived at the mouth of the Bouton Passage, which leads into the Java Sea. We were at dusk about two miles from the Islet Cadoopy. The sea was smooth, the wind was strong; we felt a sailor's satisfaction in knowing exactly where we were, which is always a happy factor in navigation. The rising moon gave added confidence, and the beautiful scenic picture of a ship, with all the royals and studding-sails set, bowling along with wind abast the beam, at the rate of twelve knots an hour, homeward bound, every heart overflowing with happy anticipation, can be fully appreciated only by the sailor. Mark here the illustrative lesson of the changing fortunes of life, alluded to by the biblical story. "Take thine ease and be merry." Why should I not be merry, indeed? Below in the cabin sat my wife, who had been

a passenger with me during the voyage, who as a companion could not be excelled the world over. The cargo of oil we had obtained would be worth, if we could get it safely to market, more than three hundred per cent. profit on the outlay of the voyage. We therefore had much goods laid up in store, and as I went below and sat down with my wife, it was in my heart to take mine ease and be merry, as we neared the renewal of all the pleasant relations of home. Hitherto I had been taxed only with the vexatious incidents ordinary to a long whaling voyage. Thereafter all was changed. Instead of taking my ease and being merry, I was brought in conflict with disaster and difficulties that tried my soul and tested the strain that nature may endure. Directly in our chosen path lay a demon, low beneath the water, with needles rising above, that terror of the sea, the coral reef. It was not laid down in my chart, which was the English survey and not so correct as the Dutch.

There was a crash. Two planets might equal it, coming in contact in their flight through the air,—or two railroad-trains; nothing else could. I was thrown senseless against the partition, and thought some one had struck me with a heavy stave. Then came a yell at the gangway, "The ship's ashore!" I gathered myself together and sprang to the deck. All was wild confusion in place of the order that had reigned. The sails were slamming in the wind's eye with such force that the masts were vibrating like saplings in a typhoon. Men quailed, as well they might. Rising to the emergency, however, I cried at the top of my voice, "All hands take in sail!" Instantly every man sprang to his place. They were well drilled; it was the usual practice order, calling the starboard watch aft, the port watch forward, and each strove to out rival the other in execution of orders. Thirty-two men all told composed the crew, and before the sails were all furled we had discovered, first, that we were hard and fast on a wall-sided coral reef, into which we had driven about eight feet. A boat was sounding with lead and line, but no bottom could be found abaft the foremast. It was apparent at once that no purchase could be rigged to draw the ship off, and if at all it must be such a one as would push and lift. With care a boat could float in places over

the reef. A spare topmast was soon pointed over the bow, with a kedge on the reef; the spar was raised, its square end planted close to the bow, the small end guyed to the foreyards and jib-boom. To it was attached our cutting-tackle. Lashing the lower block to the heel of the bowsprit and Sampson bitts, we had a perpendicular strain, and hove all we dared by the windlass. Just then it was discovered that the tide had fallen some. We had now been at work about three hours, and a rest was ordered. Distressed in mind and filled with foreboding, I was constantly measuring the danger and our chances of escape.

To the east of us, some thirty miles away, lay a chain of low islands, one of the most notorious resorts of the Malay pirates, who, like the sea-shark, smell their prey when afar off. To the west, about ninety miles, lay the south end of Celebes, studded with innumerable shoals. To the southwest, with a fair wind, three hundred miles away, lay the island of Java, toward which I had decided it was the wisest course to flee should we be driven to the extremity of taking to our boats. Much would depend upon

LIFTING THE SHIP OFF THE REEF.

at what point of the ebb-tide we had struck the reef. With tackles over the forehatch we began hoisting out the cargo furthest forward and filling the deck as far aft as we could stow the heavy casks, in order to bring the ship by the stern, and so ease the bow on the reef. About midnight, to our great joy, the tide had ceased to ebb and a little flow was perceptible, which at 3 A. M. was full up to the measure when we struck. Manning the windlass to heave on our purchase, the ship suddenly launched from

the coral maw which had held her, and swung round side by side, anchored to the reef by the paraphernalia we had used. The sharp points were grinding against the bilge of the ship with ominous sound, as she now lay head to the wind, pressing on the reef. The danger of the moment was imminent; no time must be lost if we would win. Holding a stern strain on our kedge hawser, we got another spar in position against the reef, reaching over across the bow, and with a good sixfold purchase hove the ship's head off so that the jibs and then the foretop-sail filled, and we were safe. By letting go and cutting, our gear came down with

THE PUMPING-SWEEP ATTACHED TO THE MAINMAST.

a whang as the ship forged ahead, passing only ten yards from the outer point of the reef. We had left a couple of tons of material on the reef, but in less than two hours everything had been transported on board, anchor, spars, hawser, and all. We resumed our course, steering south-southwest through the Bouton passage, and the watch was ordered below for sleep. How we had worked! The strain had been terrible. We were filled with gratitude for our providential escape, and later on finished stowing off the hold and got everything snug again. We struck a porpoise from the bow. He dived, and unable to haul him forward, I said, "Put a tackle on the line and haul till you part it," which was done. We afterward saw the fellow towing by the line, which was foul in the fore-foot where it had been chewed up by the reef. There was some leaking, but nothing alarming, and two days later we anchored at Soerabaya on the east end of Java, for the purpose of procuring fresh supplies, water, wood, etc. Notwithstanding my warnings to the men as they went on shore for the usual liberty al-

lowed, they were imprudent, as improvident sailors are apt to be, and my troubles now began in earnest. All hands were on duty the morning we left port, but scarcely had the pilot got out of sight when one of the men came to me complaining of being sick. He died eight hours afterward from Asiatic cholera. Alas! it was the first death on shipboard I had witnessed in a long service. Several others were now prostrated, and, filled with alarm and apprehension, I spent the night studying the medical books and administering to their wants. The next day our situation became truly appalling, with thirteen men prostrate with the most alarming symptoms of the disease. We were now sailing west through the Java Sea toward the Straits of Sunda. The sea was smooth, the wind light; the sun was hot and fiery. We had been so long in those eastern seas that our ship was filled with vermin, the most troublesome of which were the roach and the red ant. The heat was intense below the deck. The well were growing dispirited, for the second man had died while the burial service of the first was being performed. Through the influence of the service we were all somewhat braced up to our duty, and getting out some new spare sails a tent was made over the poop-deck to protect the sick from the night air, and all were moved and comfortably bedded there at night. Eleven now demanded constant attention, and besides these my wife and several others had shown the first symptoms of the disease through the day. I could not sleep; if I had a spare moment I could only think and study. Burdened with care and anxiety, filled with awe at the threatening aspect of our situation, I had no desire for sleep. The following morning the third man died. Another was taken with alarming symptoms requiring prompt assistance, and for the first time strong men quailed with fear and drew back. Only harsh authority kept them to their duty through the day. Toward night we hove to and disposed of the dead after an impressive burial service, conducted by my wife. A prayer was offered, and when all was over I made a short address to the crew, and we braced forward and made sail. We were now approaching a cluster of small islands called Thousand Islands. There was no practicable recourse but to sail in among them and find our way through. Common prudence dictated that we should heave to and take daylight next morning for the passage, but I felt a desperate desire to reach the open ocean and obtain a change of air, and thought my situation warranted the risk. Till long past midnight I was watching and directing from aloft, with short visits to the deck to see the sick, and we had then passed safely through. Morning came — a bright beautiful

"WHICK, WHACK," DAY AND NIGHT.

day. It was Sunday. With one exception there were positive symptoms of improvement among the sick. We were now entering the Straits of Sunda. The open Indian Ocean lay beyond where I felt sure the change of air would prove beneficial. I was worn and exhausted, not having been conscious of sleeping for five days and nights. Alas! there was no sleep that day, for we soon had some six or eight barges alongside. Traders they were who ply to and fro in that highway of commerce with their wares, such as yams, bananas, dates, monkeys, birds, bric-à-brac, etc., trading with the passing ships. They were natives of Java, noisy in the extreme, and most unwelcome visitors they were to us.

Toward night we were free from them, the way was clear, and with the setting sun my hope was rising. For the first time since leaving port I lay down and slept. Next morning with one sad exception the convalescence of the sick was more marked. This one lay very low through the day, and at four the following morning he expired. That day at sunset we hove to with maintopsail aback. Sad and mournful it was, the burial of this the fourth of our ship's company in the deep sea. Three were Americans, one a native of the Azores. All were noble, right-minded men, who had done their whole duty in every emergency. Alas, the seeming recompense!

Drawing out into the broad ocean, the strong southeast trade-winds now embraced us, and we were driving along into the long swelling sea, with the gale abeam. That night the sick were all up and about, though some were yet too feeble to go on duty. The influence of reaction from danger to security was upon me. The pumps had proved no leak of conse-

pulley from each end it seemed like fun, comparatively, for two on each side to pull down, first one side, then the other, and so work both pumps in alternation with every stroke—whick, whack, up and down. Our pumps were large-chambered, and with the power now acquired would throw two continuous streams of four and one half inches diameter, and swell the

THE SHIP ENCOUNTERS A "GRAYBACK."

quence, and I took to my berth and slept as only a sailor can. Suddenly a shrill, piercing cry came to my ears: "All hands on deck! the ship's sinking!" Rushing up, and grasping the situation at a glance, it was too apparent that the text of the alarm was true; the heavy, lethargic motion of the ship told the tale. At once the order was given, "All hands shorten sail!" A new fight was before us, and every man had a chance to prove himself for all there was in him. The ship hove to under easy sail. We found four feet of water in the hold; the strain of pressing into the billowy sea had opened the wound made by the biting reef. We pumped, yes, we pumped; we pumped, and gained, and in twenty hours we had her free. But human endurance has a limit, and the necessity for additional power was at once apparent. A labor-saving whiz-jig was now devised; it was a cross-bar of oak, high above the pumps, with standard and a center pin-bolt, driven through into the mainmast; the pump-spears were lengthened by white oak slips to the cross-bar, and with a soft tow-line

water over the top of the pumps. The deck was so flooded that raised platforms were spiked down, so that the men might keep as dry as possible while pumping in ordinary weather.

Off we went again, pumping ten thousand strokes per day, which steadily increased and soon reached upward of twenty thousand. Gloom and depression reigned in every heart. The pumps were being worked more than four fifths of the time, and the labor bore hard upon us all. The situation needed but one more factor to make our burden as great as we could endure, and it soon appeared. We had taken from home about twelve tons of stove-coal, but had no occasion to use it. This I had stowed in one of the chain-pens, beside the mainmast, to make room, as one pen had proved large enough to hold both chain cables. The third mate went down before it was put in, to examine the ceiling and see to it that none of the coal could get through to the skin of the ship, and so get to the pumps. His carelessness was proven by the coal, which now began to appear; the pump-boxes clogged

with it so frequently, we were obliged to shorten sail, hoist out the pumps, and send a boy down the pump-wells in a bowline to gather the coal as far as he could reach, and send it up in pails.

To unrig the pumps, hoist them out, and get them in position again was a masterly job, as any sailor knows, especially in a gale of wind or a rugged sea, but we must do it or sink, and if we did it once we did it forty times on the passage home. As we approached the vicinity of Mauritius, murmurs came to my ears. I heeded them not, and talked of Port Elizabeth and Algoa Bay, in the Cape Colony, as good resorts if the leak should increase upon us. I had visited Mauritius on a previous voyage, and knew it to be the home of the land-shark, whose bite was to be dreaded in a wounded enterprise. Whick, whack, went the pumps, and when I went to my bed for sleep, I lay counting the strokes until the pumps sucked or choked with coal. If the latter, and they must be hoisted out, I was up at once, as I would not trust the oversight of that operation to any one but myself, since a slight accident might prove fatal.

On the 21st of September we were close up with the Cape of Good Hope. It was the season of year when the most treacherous weather prevails, and many a good ship had here come to grief. It was worth about one hundred per cent. to insure our safe passage, but I had no recourse, I could only go forward. As we passed Algoa Bay the murmurs of the men were more pronounced; they were ready to abandon the enterprise, and their spirits were only matched by the weird appearance of nature, for the sky that day grew black as ink. So dark was it at noon that we were obliged to light the binnacle, in order that the helmsman might see the points of the compass. The barometer, a sure indicator in that region, had warned me of impending storm. A heavy southeaster was suddenly upon us; it grew strong and boisterous with the approach of night. We sped along in the roaring sea, with whole top-sails, foresail, and maintopgallant-sail set—egads, what a night it was! The furious sea boiled over the rails, and filled the decks. Every crack that led below had been battened tight. The inky darkness, the roaring of the wind, the sea filled with phosphorescent light filled one with awe at the insignificance of man, and with wonder that he should dare to brave his fate and boldly trust his genius for guidance in such a scene. The wind increasing to the force of a hurricane brought us down to a close-reefed maintopsail and reefed foresail, as we boiled along on our mad career. A constant fear of the possibility of mistake in my calculation of our position was dissipated at 11 P. M., when to my great relief we saw the

Cape Agulhas light, which we passed within a distance of two miles.

Whick, whack, went the pumps all the long night, and only next day did we succeed in freeing them for a short rest, when we were well around the dreaded cape, having made six degrees to westward in the twenty-four hours, with the help of a strong current which always runs over the Agulhas bank. Old Ocean had held high carnival, and at Port Elizabeth, which we passed about noon, thirteen ships dragged, or parted from their anchors, and were piled upon the shore that night with great loss of life. This we learned at St. Helena by advices from Cape Town.

Good weather now prevailed, and our sun of hope seemed again on the rise; but the demon of evil, in such constant pursuit of us on this eventful voyage, here dealt another cruel blow.

The first officer was prostrated with inflammatory rheumatism. He took to his bed, and did not leave it again during the remainder of the voyage. It was a loss we could ill afford in our crippled condition. Two weeks after passing the Cape of Good Hope we anchored in the roadstead, at the island of St. Helena. This had been in line with my plans for some time back. The ship was hove by the stern as much as possible; and clearing the forepeak, we calked and battened and repaired, so that I flattered myself the leak would be at least considerably reduced.

My wife and I abandoned for a day the gnawing care which had preyed upon us, and, taking a coach, we made an excursion to Longwood and the tomb of Napoleon. The road up the mountain-side runs at an angle of forty-five degrees with a sharp turn every two miles, thus making the same track that a ship would sail in beating to windward. It was cut in the solid rock by convicts, under the government of the old East India Company. Arriving near the top, the ships, as we looked down to the harbor, had the appearance of miniature boats. After visiting the renowned localities, where we were waited upon by French officers, we attended the Sunday-afternoon service, in an English church, as we rode through the rural district, and came down the valley road from an elevation of seven hundred feet above the sea.

Procuring water and supplies, my business on shore was in a few days completed. I had obtained the ship's papers and a clearance, and was about leaving the American consul's office, when some one called and delivered a paper, which, after looking over, he handed to me. It was a communication signed by eighteen of my crew, setting forth the condition of the ship in such terms as they chose to represent, calling upon the consul to cause a survey, and inform-

ing him that meanwhile they had determined to do no further duty on board. I had feared some demonstration of opposition, and when it appeared in this form was startled at what might be the possible result. I quietly related to the consul what had happened, the personal risk I had at stake, my duty as I conceived it to be, and told him, if he would leave the matter with me, I had no doubt but their grievance could be straightened out. He politely informed me that he had no desire to interfere unless I needed his assistance. I thanked him for his appreciation of my position, took leave, and I repaired on board. There was a disagreeable stillness in the air; the officers looked gloomy, and the forward hands were all below. I made no inquiries, and felt that I had none in whom I could for the moment wholly confide. I was soon prepared for the conflict, and ordering the second mate to call all hands aft, walked the deck until the insurgents were all assembled in the waist, on the port side. I then faced them, and inquired, "What's the matter?" There was no answer until I put the question to the "lawyer" of the fore-castle.

I listened to all they had to say, and then addressed them dispassionately, measuring the situation from my own standpoint. Acknowledging the hardship that had overtaken us, I spoke of the duty of all to bear up under it and obey; of my own to maintain good order and obedience; and finally, promising to forget their indiscretion, I ordered them to the windlass to take the anchor; but not a man was willing to obey. First one, then another, ventured remarks, each a little more impudent than his predecessor. The routine order and respect for authority which had governed our daily lives so long was a condition of the past, to restore which now became the first necessity. I had quietly directed to have the handcuffs near at hand, and, selecting the weakest man in the crowd, I ordered him aft to the second officer, and directed him to be put in irons. Before they awoke to opposition, we had secured three in that way. Having exhausted the weakest element, I now took the other extreme, and ordered the ringleader to follow. He sneered at me, and with an oath swore that no man should put him in irons alive.

Instantly drawing from my breast a revolver that had before been hidden, with a step toward him, the weapon leveled for his sight, I ordered him in a thundering voice to move or I would blow his brains out. A graveyard full of ghosts could not have frightened him more. He made haste to obey, begging me not to shoot as I followed him. The scene now assumed a more serious aspect to them.

I was at once master of the situation, and when all were ironed I inquired when they would

be ready to go to their duty again. A reaction had occurred in Mr. Spokesman's courage. He replied, "Never, while God gives us breath." With this declaration they were confined below, grouped so that they would be of as little social value to each other as possible. We then got the ship under way, and drifted under easy sail, with the southeast trade-wind, out of English jurisdiction. The novelty of the situation wore away with the eighteen confined below. I finally listened to their importunities, and with one exception had them relieved and brought to the position where I had last met them. They had found they were no match for the desperate determination of one man in authority, who would maintain his command at all hazards. Satisfied with their change of heart, and feeling that I still had a great undertaking before me, I finally took them each by the hand in token of my forgiveness, and ordered them to their duty. The ship was now on her course with all sail set; all hands were on duty with the exception of two, the mate who was sick in his berth and the "sea-lawyer." The latter had given me a great deal of trouble on the voyage, and was the leader of this insubordination. He was brought up from confinement, and by my order seized to the rigging and prepared for punishment, all hands being called to witness it. When all were gathered aft he felt that his hour of settlement had come. He had learned at last with what manner of man he had been trifling. Begging piteously to be forgiven, and promising the most faithful attention to his duty for the future, I finally claimed that only our misfortunes warranted my decision, and after a severe warning forgave him, and remitted a punishment I had not intended. By this episode the devil was driven overboard, and the men went cheerfully to their duty, satisfied that they had been in the wrong, and willing to make amends.

Whick, whack, went the pumps. We had a little more rest than before, but not much, when the wind was strong; and so we worked along, as fast as possible, across the equator, then through the northeast trades, and finally neared the American shores with dread and apprehension; for it was late in the month of November, when the passage in a good ship is sometimes all that a sailor wants to encounter. There was no escaping the fact that the leak was gradually gaining upon us, so that in boisterous weather we had all we could do to keep her free and carry much sail. Entering the Gulf Stream with a southeast gale, we were running in a high sea, reducing sail gradually that night, as the wind increased, with a half-watch below for sleep. We had not been able to make the pumps suck, though they had been going constantly. At 2 A. M. I became

suddenly convinced that we were in danger from the accumulation of water in the hold, and the furious sea now raging, and determined that we must come under storm-sail and heave to. I would not call all hands,—they were overworked and must sleep. I could be up all the night and all day myself, and catch a few minutes' standing sleep as I could, but I must nurse the strength of the men if we would endure the strain. The pumps were abandoned and sail reduced with all possible despatch; the foresail was hauled up snug, the maintop-sail clewed down; then came the tug of war. When it seemed a favorable moment the wheel was ordered hard aport, and the ship came boldly up to the wind, striking a sea that delivered a blow with ten thousand tons of water. An ominous crash, and two of the six boats we had were torn from the cranes, and with davits and all were swallowed by the angry sea. Not a man could have stood upon the deck and lived. Like so many monkeys we were running aloft as the sea struck, and if the masts stood the strain we were all right. Fearful now that the men could not handle the sails in the terrible gale, I asked the second mate to go up and oversee the work, while I would relieve the man at the wheel, and send him up to help. While I stood watching the regular seas, each a counterpart of the other, suddenly there arose, a few seas off, what sailors term a "grayback," a sea towering high above its fellows. It came rolling on. I was the only man on deck; the loneliness of my situation, the menacing force of the sea—well, I am willing to acknowledge that for the first time since adverse fate had followed us I was frightened. A peculiar fright seized me that went to the marrow of my bones. I thought of those below; the mate was very sick now, so that he required watchers constantly. A retrospect of past events flashed through my mind that would take me a month to put upon

paper. I thought of the struggle and the bold fight we had made against adversity, and felt a sense of injustice, if at last we must sink in the sea and lose our lives so near the goal. The sea, a towering wall, rolled high above the ship. Like the falls of Niagara, with terrible force it broke; a crash overhead, as the two spare boats were stoven to splinters and the hurricane-deck demolished. Clutching the wheel with determined grip, I was buried deep in the sea, and thought my last hour had come. That blow seemed like the forlorn hope of the enemy, for soon the decks were free, the bulwarks and everything loose were gone. The sails were furled and reefed; we lay to under a close-reefed maintopsail and foretopmast-staysail. Whick, whack, went the pumps now, for thirteen successive hours. When at last she was again free, continuous gales enabled us to get on but slowly, and on the fourth night from this we saw Montauk light, and the following night, November 28, 1865, our remarkable voyage was ended, as we anchored at New Bedford, one hundred and three days from Soerabaya. The next day it happened that I was weighed, and on the seventh day after I was again weighed and turned the scale with a gain of eight pounds avoirdupois; so great had been the strain of care and anxiety coupled with physical exertion.

A fateful destiny had ever seemed following in the wake of the *Brewster*, in which I had now made two successive voyages, covering a period of four years and nine months. She was repaired and fitted again. Four of our men took service on the new voyage, and when the wind was fair and the sky was clear, she sailed away over the treacherous sea—the sea, the sea! No tidings came or ever returned to the friends who were left behind, and we know not how, or where, the merciless sea finally subdued its prey and swallowed the feast.

John A. Beebe.

SCIENCE AND IMMORTALITY.

INTRODUCTION.

If a man die shall he live again? This is a question which every one of us must seriously face, and answer to ourselves, sooner or later, and upon this answer will largely depend our conduct and our views of life itself.

As age draws near, and youthful ardor gives way to retrospect; as one by one friends pass from sight, and the common fate confronts ourselves; are we to face our coming doom with the despair of the condemned criminal, or

Like one that wraps the drapery of his couch
About him, and lies down to pleasant dreams?

The Christian meets the issue with a hope that reaches beyond the grave. But even to the Christian must come times when the hope grows dim and doubts press in, and he is forced to realize that hope alone does not necessarily imply conviction. Even such hope has been comparatively a late comer into the world, and multitudes of the human race have lived and still live and die without it. Thus the answer of human testimony is conflicting. Unlike the belief in freedom of the will, the belief in immortality is not an immediate deliverance of our consciousness, but rather an attainment, more or less difficult to all, and not to be accomplished without effort. To this belief the Christian attains through acceptance of revelation and faith in the assurances of a divine messenger to man. This must ever be the most satisfying, readiest, and most common method of attainment—a method which appeals to all, and which requires no philosophic study for its apprehension. But we think it will be the uniform testimony even of the Christian believer that faith is not always triumphant. As we stand by the bed of death and watch the unconscious struggles of departing vitality, nothing manifest but the automatic action of the physical machinery; as we survey the lifeless form, and stand by the open grave; or as we mark the sudden extinction of life,—at one moment view a self-conscious, self-determining personality, the next behold but an inert, lifeless form,—who is there who has not felt the rise of questionings which can never be answered, and, face to face with this mystery of daily experience, felt the risings of doubt, and realized with sinking heart that faith is not always the

companion of conviction? The heart would fain believe, but the intellect falters and hangs back. It becomes therefore of supreme importance to all earnest minds and loving hearts to inquire whether this faith can be securely linked to intellectual conviction. Must it ever and always rest upon revelation alone, and can we never expect to find, outside of such revelation, at least such a reinforcement of its claims as shall insure unassailable belief?

From this point of view the question, What has the science of to-day to say about the problem of immortality? appeals to all. Viewing the universe from the standpoint of science alone, does immortality, or a future life for man, appear as the only reasonable conclusion?

If any large number of representative men of science were thus interrogated, a small number would undoubtedly be found to hold that there is scientific evidence both for and against such a belief. A somewhat larger number, possibly, might reply that such scientific evidence as existed at all was dead against any belief in immortality. But undoubtedly by far the larger number would insist that such belief must ever rest upon grounds which science does not touch at all, and that all such questions are entirely beyond its scope. For this latter class Professor Huxley has well put the case for all.

"With respect to immortality," he says, "as physical science states this problem, it seems to stand thus: Is there any means of knowing whether the series of states of consciousness which has been causally associated for three-score years and ten with the arrangement and movement of innumerable millions of successively different material molecules can be continued, in like association, with some substance which has not the properties of 'matter and force'? As Kant said, on a like occasion, if anybody can answer that question, he is just the man I want to see. If he says that consciousness cannot exist except in relation of cause and effect with certain organic molecules, I must ask how he knows that; and if he says it can, I must put the same question. And I am afraid that, like jesting Pilate, I shall not think it worth while (having but little time before me) to wait for an answer."

SCIENTIFIC EVIDENCE OF A FUTURE LIFE.

THESE three positions would, I think, include all men of science. I wish to discuss here the

first position, viz., that there *is* scientific evidence for the belief in a future life.

Professor Huxley's statement of the problem, just quoted, does not put the issue exactly, as we apprehend it. The belief that consciousness can be continued hereafter "in association with some substance which has not the properties of matter and force" is one the very statement of which removes it at once from the pale of scientific discussion. With regard to such a belief Professor Huxley's remarks seem quite pertinent. But a belief that the same consciousness which has in the past associated itself with myriads of successive molecules, by that very fact proving that it depends in no wise upon specific molecular arrangement, can continue in the future so to associate itself with other successive molecules, is a very different belief from that which Professor Huxley attacks. Belief in a substance which has not the properties of "matter and force" does not appear essential to belief in a future life. The future life we believe in is based directly upon the manifestations of matter and force as interpreted by science, not upon their negation, and if any one asks how we know anything about such a belief, that is just the question we purpose to answer.

Upon this question science appears to me to have much more to say than has been commonly supposed, and what it has to say seems quite as conclusive as many beliefs which are unquestionably held upon scientific grounds. It is always within the province of science to employ legitimate inferences from observed facts. Its proudest claim has been its ability from a study of the past to foretell the future, and if this process is to continue to be considered as sound, then it seems to me that science, as it exists to-day, furnishes material for an argument of the greatest strength in favor of immortality.

Perhaps the most brilliant and striking illustration of this power of scientific method is furnished by the discovery of the planet Neptune. By rational inference from observed facts the conclusion was reached independently by two astronomers, Leverrier and Adams, that far beyond the orbit of Uranus another planet must exist. By further rational study of the known facts the place of this new planet was fixed. Finally, when Dr. Galle turned his telescope to the indicated place, the planet was found.

Suppose, now, that when Dr. Galle thus turned his telescope to the place indicated no planet had been observed. Suppose that, from that time till now, we had never been able to verify the result of the astronomical calculations. What, under the circumstances, would have been the scientific value

of the conclusions of Leverrier and Adams? Would the conclusion have been any less scientific because not verified? Would such verification by actual sight have been considered essential to establish the validity of the conclusion that such a planet must exist? By no means. Astronomers undoubtedly would have been forced to conclude that, whether visible or not, the planet existed. This conclusion would have been necessitated by the consideration of the observed facts; and even though the test of experimental verification were forever withheld, the existence of such a planet would have been regarded by them as an undoubted fact, and not as a visionary speculation.

Now the scientific argument for a future life is similar in its character to this supposed case. Irresistibly indicated by the facts, the character of the argument and the validity of the conclusion are not less scientific in every sense, and should be no whit less conclusive even though the test of experimental verification is withheld.

But in every case of satisfactory inference the argument is based upon certain accepted principles. In the scientific analysis which led directly from the observed facts of certain irregularities of motion in the orbit of Uranus to the conclusion of the existence of Neptune, the fundamental principle was the law of gravitation. Observe that such irregularities were, considered in themselves, facts which were apparently in direct contradiction to the accepted principle; but instead of regarding such facts as evidences against this principle, the discovery itself consisted in bringing them into harmony with it. That supposition, which was necessary and sufficient to produce such harmony, was thereby constituted a sound conclusion. Without this fundamental principle no conclusion could have been reached. Indeed, without this principle astronomy itself would be only a mass of empiricism, and could have no philosophy nor ever rise to the dignity of a science. Men might observe the heavens and multiply observed facts, but the key to their interpretation would be wanting. Under such a state of things we might conceivably find astronomers themselves regarding the probable existence of a planet beyond the orbit of Uranus as a very problematical hypothesis. They might, in such cases, divide into three parties upon such a question, just as scientific men now do with respect to the question of a future life. Some might hold that there was evidence for and against the hypothesis, for it would at best be only an hypothesis. Others might hold that the facts were dead against the existence of any such planet. Others, again, might claim that such a question was entirely beyond the scope of astronomical science, and remark that "if

any one knows of the existence of such a planet, as Kant said upon a like occasion, he is just the man I want to see; and if he says there is no such planet, again I must ask how he knows that." This would evidently be the position.

But now introduce the fundamental principle of gravitation, with all its logical consequences, and see what a change. At once order comes out of chaos. Observed facts take on mutual relations, and lead to irresistible conclusions. The statement of the existence of a planet beyond the orbit of Uranus is now seen to be a necessary result of the constitution of the heavens. The facts before supposed to be dead against such a supposition are now the very ones which lead to its acceptance, and there is one attitude of universal consent. Whether the planet can be seen with the naked eye, or with the telescope only, or not at all, still its existence must be accepted because it alone can bring the observed facts into harmony with the demands of the fundamental principle.

To give to our discussion of the question of immortality scientific value, therefore, we must be guided by some similar principle upon which scientific men will agree upon purely scientific grounds. Without such a principle we cannot expect observed facts to reveal mutual relation, or to lead to convincing conclusions. Without it, the belief in immortality must, from the point of view of science, be regarded as but an hypothesis. But if such a principle can be established on scientific grounds, we may then expect general assent. Whether the conclusion can be verified by experience, it is at once taken out of the region of debatable hypothesis, and takes rank as a scientific inference which must be accepted, if found to be in harmony with accepted truth.

Can we establish such a principle as a guide for our discussion, which shall thus bring order and relation into the observed facts, and in the light of which we can hope to read the future of the race? And can we firmly establish this principle upon purely scientific grounds?

I think we can, and this principle I would state as follows:

The universe in all its parts is the visible manifestation to us of underlying mind, and all interpretation by us of the phenomena of nature should therefore be guided by the assumption of underlying purpose.

This principle I hold to be the direct outcome of what we know of nature, as necessary for harmonizing our knowledge as the assumption of the existence of Neptune, and I therefore claim it as a strictly scientific deduction from known facts. Let me briefly give the process by which it is, to my mind, completely established as a scientific conclusion.

It is admitted as an undoubted fact of sci-

ence that the universe is so constructed that any change in any of its parts is a change which affects the whole. This is but a restatement of the law of gravitation itself. If the motion of so much as a single atom of matter is changed, the motion of every atom in the universe must be thereby affected. Every man of science will admit this as a certain conclusion of science.

It is also admitted as an undoubted fact that physical contact between any two atoms or ultimate particles of matter never takes place. The nearer they approach, the greater the force of repulsion between them. Whatever theory of the constitution of matter we accept, whether we adopt the hypothesis of a discontinuous ether or the vortex theory of Sir William Thomson, it is accepted as conclusively demonstrated by experimental test that atoms can never come in contact.

But if this be so, how is it that a change of motion of one atom can affect not only the neighboring atoms, separated as they are by spaces which relatively to the size of the atoms themselves are immensely great, but can also affect all other atoms in the universe? No mechanical answer to this question has ever been found. It is and has always been an inscrutable mystery. From the physical point of view this mysterious fact has no counterpart in what we observe, no analogy in our experience, and cannot therefore be explained in terms of the rest of our knowledge.

But now, when we come to a study of our own organism, we find this mysterious fact to have a very striking connection with our daily experience. We find the evidence incontrovertible, that within our organism certain portions of matter are governed by mind, and move in accordance with the dictates of will. Thus every voluntary motion which we control is a manifestation of underlying mind. As we follow the sequence of cause and effect, we finally arrive at some molecular brain-disturbance, and there, as with the physicist, mechanical explanation can go no further. Here again we meet the same inscrutable mystery. The underlying will sets in motion at some point in the brain molecular disturbances, the outcome of which is the voluntary act. Given this disturbance, we can trace, more or less clearly, a continuous mechanical sequence of cause and effect. But the bottom fact of motion itself, which to the physicist admits of no interpretation in terms of the rest of his knowledge, now appears as a fact of experience in connection with mind. We are thus obliged to recognize mind as an essential condition of motion, so far as voluntary action affects ourselves.

But these brain disturbances, which thus reveal to us the action of mind, must affect the motions of every particle of matter in the uni-

verse. This is admitted. The conclusion is therefore irresistible, and in solid accord with experience, that mind, even as manifested in ourselves, affects the entire universe. We are thus forced to conclude that the universe is so constructed that in every part and throughout its whole extent mind not only can but does affect it. The very assumption of uniformity, the basis of all science, is a direct corollary of this view. We observe everywhere an invariable sequence of cause and effect, so that, having observed any action in the past, we infer that if the same conditions were to recur the same action would take place. In terms of mind this can mean only unvarying purpose, which, because it is unvarying, must always act the same when the conditions or antecedents are the same. Thus uniform action takes on meaning and significance, and instead of being an ultimate fact is seen to be a necessary consequence.

If now all our experience were confined to observation of ourselves alone, and no other facts or phenomena were observable by us than those which we ourselves furnish, we could not imagine even a possible exception to this conclusion of a universe governed by mind. In such case every action we could observe would be seen to end ultimately in what we could prove beyond doubt to be mind action, and we should consider it as demonstrated that in mind, and mind alone, all motion had its origin. The chasm between mind and its material manifestation would be still as impassable as ever. But this chasm would not be that which confronts the physicist. The origin of motion, which for him has no analogue in his experience, would be explained fully in terms of the rest of our knowledge by referring it to mind.

Our observation, however, is not confined exclusively to ourselves. Everywhere in nature we observe motions which are not due to the action of human volition. What shall we say of such? What can we legitimately conclude, in harmony with what we already know, unless we admit that since some of the phenomena we observe are beyond doubt due to mind, and such mind action undoubtedly affects the entire universe, thereby proving that the universe is of such a nature that throughout its entire extent mind affects it, therefore all the action and motion we observe, whether due to our human volition or not, must likewise be referred to the action of mind?

Does this seem "mere analogy"? Well, it is none the less scientific on that account, and none the less convincing. There seems to be a prevalent belief that scientific truth is based upon what is called "rigid demonstration." Outside of geometry I cannot name a single instance of what can be properly so called, and

even in geometry and mathematics, pure and applied, the conclusions arrived at are always contained in the premises themselves. The complete statement of any problem involves its solution. In no branch of science can demonstration ever yield what the premises do not contain. So-called "rigid demonstration" is only that which does not go outside of the premises, and which produces conviction. It stands simply for a high degree of certainty, and in every case rests upon analogy and cumulative evidence. Every great scientific generalization is an illustration of the use of analogy. The discovery of the law of gravitation itself is a case in point, and it is worthy of note that of this very force—"the very muscle of Omnipotence"—Sir John Herschel has said, "It is but reasonable to regard the force of gravitation as the direct or indirect result of a consciousness or will existing somewhere."

This is precisely the conclusion at which we have just arrived, and it seems so absolutely demanded by the facts, so directly in accord with the rest of our knowledge, that it must carry conviction.

We assert then, as a demonstrated scientific conclusion, that back of all phenomena in nature we are forced to recognize controlling mind. No philosophy of science can safely cut loose from this conclusion. The verification of this conclusion must be found in its power of harmonizing all our knowledge into one consistent whole, of detecting relations otherwise hidden, of unifying our views of nature. Such verification is the highest that any scientific conclusion can claim. Let us point out briefly how satisfactory in this case such verification is found to be.

It seems to me that very much of the scientific philosophy of our day goes astray simply because it endeavors to cut loose from this principle of mind as the basis of all phenomena. We might conceivably, for example, trace clearly every stage in the progress and evolution of the earth and its inhabitants, from the primitive nebulous state to the present time. We might recognize every successive step as the necessary consequent of the antecedent conditions. We might thus, conceivably, exhaust the entire physical content. But yet the real relation of each step to the antecedent conditions would not be even touched. We would have a multitude of facts more or less coherent in groups, it might be, but no unity throughout. No guiding principle upon which to base such unity would be discerned. We should observe a process, but no plan; orderly change, but no purpose; mind and intelligence emerging from matter and force, but no antecedent mind and intelligence. This, indeed,

seems the bias which to-day warps much of our scientific philosophy and builds upon sound facts a top-heavy structure. The assumption seems to be that if we can trace the mechanism, and exhaust the entire physical content, we shall explain everything, and the intellectual and moral content will be necessarily included. The physicist, dealing exclusively with matter and energy, may be quite right in confining his study to the purely physical aspect; but when he proceeds to construct a philosophy of the universe, such a position is an insufficient basis. To deal with phenomena and ignore that which lies back of all phenomena, to attempt to unify all knowledge by disregarding that which gives significance to unity, is to fail at the very start.

THE GAPS IN SPENCER'S SYSTEM.

THE most striking illustration of this bias is furnished by that system of philosophy which to-day has put its stamp upon all scientific thought. Herbert Spencer, in an outline of something like 4500 pages, has made the serious attempt to unify all human knowledge, to comprehend in one principle every event that has ever occurred in the entire universe, to reduce all science and all human knowledge to a single principle—that of the “persistence of force.” The bare statement of the attempt is stupendous, and the execution is the most brilliant and daring philosophic achievement of this or any age. It is an attempt, moreover, in line with the scientific thought of the day. Such unity is the dream of science. Its progress is marked by such striving, from Kepler and Newton to Darwin and Spencer. The attempt has been carried out by the hand of a master, and stamps its author as among the first philosophers of the age.

Now this philosophy of Spencer assumes to be a logical whole. Upon this unity its value as a system depends. Without such unity parts may cohere closely and remain of great value, but it is then only a system in ruins—no longer a monolith, but a series of detached blocks, each perhaps complete, but without bond of union. This, it seems to me, is exactly the case, and it accounts, perhaps, for the poor success of those antagonists who, realizing more or less clearly this weakness, have tried to assault the system in detail. In such a logical whole any lack of unity must be due to the premises. Now it seems to me that the best verification of the principle we have enunciated, viz., that all force is the manifestation of mind, would be obtained by pointing out that unavoidable gaps occur in this system, and that these gaps are completely closed by the admission of our principle. Once admit this principle into the prem-

ises, and, with little change, the system becomes a logical unity, and at the same time the most comprehensive and conclusive argument for theism that science has yet framed.

The system starts with matter and force, and that is all. Mr. Spencer explicitly states that between mind and matter there is a chasm which logic cannot cross. Yet it is precisely this chasm which he is obliged to cross. For, starting with the persistence of force alone, he is obliged somewhere to obtain mind as the outcome.

Here then is the first gap, and it seems to illustrate clearly the bias I have referred to. Only the physical content of “force” is recognized. Of anything back of force there is no mention. Starting, therefore, from a premise which does not include mind, no mind can be logically deduced.

But in the light of our principle, we see at once that “persistence of force” resolves itself into existence of mind, and uniform action is the manifestation of purpose where action is invariable so long as conditions are unchanged. We start thus with mind in our premises, with purpose back of force. The word “force” has thus a deeper content than the physicist recognizes, and the gap is at once closed.

The same holds true as to the introduction of life and consciousness. No life without antecedent life, no consciousness without antecedent consciousness, becomes now a conclusion for which we do not need to imagine some possible exception at some indefinitely remote period of time. With life, mind, intelligence, we start. They are in the premises. They belong there by scientific right, and thus from a purely scientific standpoint the gaps close up in perfect accord with theism.

Again, Mr. Spencer lays it down as a fundamental axiom that the deliverance of our consciousness must ever have for us a validity transcending all else in certainty. This is the highest sanction truth can have, the strongest ground of conviction. Yet the demands of his system force him to a conclusion which this very consciousness denies. For in not recognizing mind as the basis of all natural phenomena, and conceiving of force as divorced from intelligence, he is obliged not only to evolve life, consciousness, and mind from matter, in spite of the chasm between them which he himself admits to be impassable, but he is also forced to deny the freedom of the will. In a universe of matter and unintelligent force only, mind, even if evolved, must be wholly circumscribed by material conditions. But this directly contradicts the deliverance of that consciousness which he himself concedes as supreme. This consciousness of freedom is the common possession of all mankind. No man requires it to be proved, though untold volumes

have been unsuccessfully written to disprove it. When all is said, and argument has been exhausted, we still remain as sure as ever of our freedom, simply upon the irreversible deliverance of our consciousness. This is as it should be in a world based upon mind. The supreme validity of consciousness ought not to rest in such a world upon formal logic, or be a late and difficult attainment of intellectual conviction. It is with us, born in us, part of us; and a system of philosophy which recognizes its supremacy, and is yet logically forced to deny its validity, stands self-condemned.

Moreover, such freedom is the basis not only of our laws and the adjustment of justice between men, but the basis of moral obligation itself, which stands or falls with it. This is the outcome of Mr. Spencer's philosophy that has chiefly and properly aroused opposition, and gives to it its antitheistic character. Upon this point the theologic fire is especially turned. Unfortunately it has been considered necessary in order to capture this issue to batter down the solid ramparts behind which it finds shelter. This is not necessary. Admit our principle into the premises, and the denial of free will, with all its consequences, ceases to be a logical necessity. It then appears as an unnecessary addition, not an essential part of the structure. The pages devoted to the task of denial can be stricken out without injury to the coherence of the whole. In the light of our principle, we need not go outside of our premises to admit freedom. As the end of creation, we share to some extent the attributes of the will which guides creation; to a certain extent we exercise the same power of causality; within certain limits matter obeys our behest, even as all matter is subject to mind, and we possess conscious personality, free will, and causality as partakers and co-workers with mind, through the possession of mind.

Here, then, we have a system which embraces the moral and spiritual as necessarily as the material and physical; and not the "persistence of force," but the invariableness of that which underlies all force, is the solid basis of it all. Without this guiding principle the facts lose coherence and significance,—they mean nothing,—and the entire system falls into fragments. With it meaning and purpose light up every step, and fragments are organically related, and the stupendous work of Spencer, which has been so violently attacked in the interests of theism, becomes the most convincing and comprehensive theistic argument science has ever framed. That it will one day be so regarded, I firmly believe. It will not be the first time in history that such a result has been attained.

I have devoted this much of space to the

establishment of our principle because it is the corner-stone of our argument. It is a principle which to-day hardly needs to be dwelt upon, and I might well have felt justified in assuming it as a conceded fact. The scientific basis of theism is recognized practically by all scientific men, whatever their religious beliefs or their views of a future existence. None occur to mind, and Spencer least of all, who do not recognize in nature the workings of a power back of nature, to which all must be referred. The testimony on this point is united and overwhelming. I have thought it well, however, to give what seems to me the most direct and convincing of the many converging lines of thought which center in this conclusion. We see it to be a fact of science that mind affects matter; that this action of mind is felt through the entire universe; that the universe is thus capable of responding to mind. The only conceivable view in harmony with these facts is that all phenomena are due to mind.

Once recognize mind and purpose back of all material manifestations, and the question of man's future state becomes one upon which science may have much to say. As, without the unifying power of the principle of gravitation, the existence of Neptune would have been but an hypothesis, and could make no claim upon general consent, and since in the light of gravitation observed facts and even apparent contradictions take on mutual relation and lead to conclusions which all must admit; so, in the present case, without our guiding principle facts appear devoid of significance, and immortality becomes but an hypothesis which science cannot definitely settle,—while with it, order, mutual relations, everywhere spring into view, and the hypothesis gives way to certain conviction.

Looking back now over the whole vast scheme of orderly evolution, each step the revelation of purpose directed toward some end, what are we forced to conclude as to man's relation to this purpose and end? We see a vast interplay of force and matter, on a scale far surpassing human comprehension, leading up to consciousness and life. This consciousness and this life appear in strict accord with antecedent conditions. If we could reproduce those conditions, we should expect again the same action. The result we must regard, therefore, as the action of mind guided by unchanging purpose. Then, still in accord with progressive conditions, we observe an orderly evolution of mind, emerging in conscious identity and the conviction of freedom. Then come to the front moral responsibility, spiritual progress, conscience, self-denial, and character, all pointing in the light of purpose to some yet far-distant goal, and thus at last we are forced to re-

gard man as the result of all this mighty process, as designed for some end commensurable with the vast agencies which have called him forth. And now, if all this wondrous development, based upon mind at every step and with purpose attested by uniform action at every stage, which has led steadily up to the final result of self-conscious mind and spirit embodied in material existence, is to end in collapse and utter extinction of the very result attained, what a ridiculous mouse the mighty mountain has brought forth! What a gigantic failure! A process seen clearly to rest upon everlasting purpose, a plan conceived in intelligence and discerned by reason, is found to be but aimless and purposeless activity, which ends by destroying the very object attained. Can such a conclusion stand for one moment the test of reason?

JOHN FISKE'S POSITION.

As Professor Fiske has put the case:

From the first dawning of life we see all things working together toward one mighty goal, the evolution of the most exalted spiritual qualities which characterize humanity. Has all this work been for nothing? Is it all ephemeral, all a bubble that bursts, a vision that fades? On such a view the riddle of the universe becomes a riddle without a meaning. The more thoroughly we comprehend that process of evolution by which things have come to be what they are, the more we are likely to feel that to deny the everlasting persistence of the spiritual element in man is to rob the whole process of meaning. It goes far toward putting us to permanent intellectual confusion, and I do not see that any one has as yet alleged, or is ever likely to allege, a sufficient reason for accepting so dire an alternative. For my own part, therefore, I believe in the immortality of the soul, not in the sense in which I accept the demonstrable truths of science, but as a supreme act of faith in the reasonableness of God's work.

From our point of view we can go further than Professor Fiske. We can hold immortality also a demonstrable truth of science itself, because, as we have seen, such faith is at bottom the soundest basis of demonstration which science can claim. Demonstration, even in science, can go no further than to show the high probability of certain observed relations, and the very existence of any relations at all can be accounted for only on the basis of underlying reason and purpose. Uniformity itself, the very foundation of science and scientific demonstration, is the necessary result of the action of unchanging purpose. To our mind, therefore, Professor Fiske's statement is itself a demonstration, for its rejection implies the contradiction of that principle of divine causation which we have seen to be a sound scien-

tific induction, in accord with all we know and verified by the whole structure of scientific knowledge.

OBJECTIONS TO A BELIEF IN A FUTURE LIFE.

THERE are scientific facts and analogies which are generally regarded as subversive of a belief in a future life. The changes upon these have been rung so often and so persistently that the impression is common that the weight of science is dead against any such belief. Let us examine the most weighty of these objections, and see how in the light of our principle they fade away.

The first and perhaps most obvious is that, as we see both the beginning and the end of the action of man's will power, analogy suggests an end to the will power itself, *i. e.*, to man's soul. To begin implies to end. In other words, the end of an orderly process governed by purpose toward the attainment of that end ceases to exist as soon as the process itself is completed. If a man manufactures an article by an orderly process, as soon as the process is completed the manufactured article, which is the result of the process, disappears! We see the beginning and end of the process; hence the end attained ceases with the process. The objection needs only to be stated in terms of our principle, to disappear. In any process the end only becomes manifest when the process itself ceases. To the will power back of all natural action we can discern neither beginning nor end, and when we observe in the unfolding of that action through a long series of changes, guided at every step by purpose and culminating at last in man, a cessation of the process, the only sound inference is that the end in view has only just been attained.

Again, it is objected that if man is only the last in a series of organic existences, starting from the lowest, and if consciousness has itself been a gradual development, then it seems difficult to suppose any such break in the series as is implied in the passage from mortality to immortality. The point of this objection lies in the assumption that continued existence is a break in the series. If consciousness has already associated itself with matter for some threescore years, is it hard to admit that it may continue so to associate itself in the future? How about the "breaks" involved in the evolution of life and consciousness itself from inorganic matter? Is it more difficult to suppose the continuance of consciousness when once evolved than to conceive of its evolution?

Again, it is urged that consciousness as a condition of every living organism is observed to cease with the dissolution of that organism. The inference is that it cannot exist without

that special organism in which it has once been manifested. It is hard to see the validity of such an inference. We observe consciousness as a condition of many diverse organisms, from microscopic forms to man, not restricted to any one special form. We find it surviving constant changes in the material of each organism, amounting to a periodical complete change of the material constituents. In the light of these facts and of our principle, we see that since conscious mind is at the bottom of all material manifestations, it is manifestly inadmissible to make its existence depend upon the dissolution of any special and constantly changing form.

Again, it has been alleged that there is no sentiment or emotion manifested by man that is not traceable in some degree, however slight, in animals below man, and immortality of the personal consciousness for one would imply immortality for all. "There would seem to be no reason," says a well-known naturalist, "why certain early protoplasm should have been left out in the cold, and hence there should be some chance for every toadstool and thistle."

Immortality, it may be replied, is not claimed for consciousness or mere power of sensation, but for self-consciousness, for self-determination, for personality, for conscious identity. Consciousness such as this is not the property of all, and is not possessed by every toadstool and thistle. Not the survival of consciousness but the continuance of personality and conscious identity is the point at issue. Still, it may be urged that such conscious identity may be claimed for many animals besides man, and the objection, though modified to exclude toadstools and thistles, may still apply far down the scale of life. Even this claim might be disputed. Conscious identity is an abstract conception, and animals below man have not yet been proved capable of abstract thought. Still, waiving this point also, our principle easily refutes the objection. Once admit meaning and purpose in the universe, and the objection is answered. From this point of view the statement of Lotze is unassailable, "that every created being will continue whose continuance belongs to the meaning of the world, and so long as it does so belong; whilst every one will pass away whose reality is justified only in a transitory phase of the world's course."

From this point of view there is much in nature very significant in its bearing on the point at issue. Admitting an orderly development from inorganic to organic, through plants and animals to man; admitting that the sentiments and emotions of man are traceable and foreshadowed in lower forms of life, let us turn our faces toward the future instead of the past, and, in the light of reason and purpose running

through the whole process, ask, not whence and how these things have come, but whither do they point?

When we do this we observe at once one very significant fact which marks man off from all the lower animals, and stamps him unmistakably as the end of the physical process. This fact, which has been dwelt upon by both Dr. Martineau and Professor Fiske, is the vast disproportion which exists in him alone between his faculties and his physical needs. Everywhere else in nature we find perfect adjustment between organ and function, of means to ends, of faculties and physical requirements. Indeed, the theory of evolution itself demands that such shall be the case. The animal produces new organs, by modifications of those already existing, only in accordance with his needs and the pressure of environment, and thus keeps in perfect adjustment with that environment, but in the very nature of the case can never rise beyond it. Development follows need, and never outruns it. This is another proof of the action of mind in molding matter. Mind lies back of change. To eat, avoid enemies, live and multiply, sums up the whole of animal life. Not an instinct, propensity, habit, appetite, or passion is observed which does not exist solely for these ends. Should such appear, they must at once be lost, for the animal has no need for it. He cannot accumulate a store of useless mentality. We see that the dissolution of such an organism means that it has served its purpose. The statement of Lotze applies at once.

THE ARGUMENTS IN FAVOR.

How different is the case with man! Where is this exact adjustment, and what is the meaning of its loss? Appetite, passions, instincts he shares with the animals, gets them from the animals if you will, but satisfy them all, leave him not a physical need unsatisfied, nor a bodily want unsupplied, and only then does he really *begin* to live. The energy for such needs and wants is a handicap on his true development. He strives incessantly to get them out of his way with the least effort possible that he may gain room for spiritual ends. These are his pressing, impelling powers. His environment is spiritual as well as physical. What is this spiritual environment for? For what is it fitting him? He must needs know the secrets of nature, pry into the formation of far-distant worlds, and tell their courses and periods. The worlds of large and small, of time and space, open before him. He interprets by reason the workings of reason everywhere about him, allies himself with his fellows in social bonds so strong that the very animal instincts, desires,

appetites, and passions which are the means of development for the lower animals are by him opposed, subjugated, ignored even, for higher ends. He is impatient of them, feels them as restraints, and beats against them as the imprisoned bird against his barriers. He alone can treat this physical life as dross, and lightly toss it away for the sake of spiritual truths. He alone has it in his power to bring will into accord with right reason, to coöperate as an active agency with the supreme will, and he alone can build up character by voluntary action, in the light of reason and in defiance of his animal inheritance. He claims immortality as his by the divine heritage of hope. He is the hoping animal.

Toadstool and thistle indeed! What does this enormous endowment in excess of physical needs imply? It must *mean* something. This cannot be without import. If in a world of purpose and intelligent design science, from a consideration of man's physical similarity with the lower animals, can unfold his past, can she not with equal certainty, from a consideration of his dissimilarity, prophesy his future? Does the revelation of design in nature hold good only in the backward view? Shall science tell us of man's descent and have nothing to say of his ascent? Man is not fitted to this world. He is hugely over-fitted. He has broken loose from physical environment, and has passed up, through, and beyond it. "From the moment," says Wallace, "when the first skin was used as a covering, . . . the first seed sown, or root planted, a grand revolution was begun in nature,—a revolution which in all the previous ages of the world had no parallel; for a being had arisen who was no longer necessarily subject to change with the changing universe, a being who was in some degree superior to nature, inasmuch as he knew how to control and regulate his action, and could keep himself in harmony with her, not by a change of body but by an advance of mind." And what an advance! His environment is no longer physical, it is spiritual. The physical environment has served its purpose and produced him. Has this new environment no purpose, and is it fitting him for no ulterior end? Reason, intellect, awe, wonder, the sense of beauty—do these things in man merely feed the body? Conscience—what does it mean, this scourge of disobedience, which we find to be sharpest and most imperative on the first offense, but which becomes blunted and dies out through repeated action? This is no mere punishment. As a punishment it is a failure—precisely the reverse of what it should be. As a punishment it should be light at first, but heaviest under repeated disobedience. All physical suffering and penalty act thus. Why should the reverse

hold true for the soul? This is not penalty, not *post-*, but *pre-*monition, not a punishment for the past, but a warning of the future, and it acts most vigorously precisely when most effective for this purpose, ceases when this purpose is useless, and flings man back to the stern tutelage of outraged law.

Justice demands immortality. The unequal distribution of happiness, disasters mingled with pleasures, misery side by side with happiness, the hard, unequal lot of many, bearing the heavy burden not only of their own but of others' transgression—the sins of the father visited upon the children, ignorant transgression punished with merciless severity, lifelong pain, and suffering, and misery of soul and body incurred through no conscious fault—is all this for some ephemeral and far-off benefit to a short-lived race, drifting onward to final extinction on a cooling planet? And shall there be no compensation to the individual? No hereafter where the patient sufferers of earth's injustice and nature's pitiless reprisals may look back through the vista of years and see unfolded before their glad eyes a vast plan of wisdom infinite, of righteous justice, of goodness and mercy; may rejoice in sufferings past, as they trace the influence of their suffering lives, and begin to understand at last their share in the wondrous plan, and look forward with glowing anticipation to continued coöperation and loving service!

Or take love. Is there no difference in this as manifested in man and the lower animals? Does it count now for the individual alone, or even chiefly? An impelling power which puts self in the background and brings to the front self-sacrifice, self-denial, duty; smoothes the rugged path, and makes desirable action which would otherwise be intolerable; which attaches man by every fiber of his heart to others as though in very assurance of unbroken fellowship hereafter; which implants in the deepest depths of his being the unquenchable hope of immortality—is there no meaning in this? "It is," says Dr. Munger, "related of an Arab chief, whose laws forbade the rearing of his female offspring, that the only tears he ever shed were when his daughter brushed the dust from his beard as he buried her in a living grave. But where are the tears of God, as he thrusts back into eternal stillness the hands stretched out to him in dying faith? If death ends life, what is this world but an ever-yawning grave into which the loving God buries his children with hopeless sorrow?" Shall men have the "soul of a seraph and the fate of an ephemera"? Shall love and adoration rise for countless ages to a God who has no reply? Cannot man demand immortality by the "inexorable logic of love"?

Or take man's intellectual advance. Why should he read the work of design everywhere about him; why this insatiable thirst to *know*; why the revelation of power and wisdom and design and love in and about him, till, offspring of earth, he lifts to heaven adoring hands and names "Our Father"; why should he only just begin to learn the capacities of his being, the nobleness of his intellect, the infinitude of the universe, and just begin to appreciate what he must reluctantly relinquish, as his longing eyes close in everlasting death? Is not the reluctance itself a premonition, the very longing a promise? And what a waste is here! "It takes all mankind to make a man, and each man when he dies takes a whole earth away with him." "It is to the honor of human nature, and what can be said of no other creature, that the best fruits of all together suffice for no more than to make each one what he may be." Or take the great fact of death itself. Everywhere in nature we find death to be the first step of further progress, the invariable antecedent of higher life, the prelude to entrance to another state. Each stage is the heir of all the past. Can it be that man is the sole exception, and that for him alone of all created beings these facts have no significance? Everywhere in nature we see the workings of a process keeping every step gained and steadily rising to the next, always taking over into the next stage all that has accrued in the past, transforming inorganic into organic, tending then upward to higher development of life, then passing into mind, ever subordinating material to mind, passing on into the spiritual realm, and culminating in a self-conscious individuality. With the birth of this individuality man enters upon the scene as a new creation. And now shall the next stage for that being prove like all the preceding, the inheritor of all the past; shall we take over into the next stage all that has accrued in this, or shall man prove the sole exception, and in the next stage of his life-history leave behind him the culmination of it all? Looking backward we can see each gain foreshadowed in a previous gain.

Does self-conscious mind, the last gain of all, foretell no future?

These are facts of nature and science. Scientific thought cannot ignore them. Their interpretation is as legitimate, as necessary, as conclusive as that of the rocks and stars. In the light of purpose they are as decisive of man's future as the structure of his physical organism is of his past. If the record of the past is recorded in his skeleton, his present endowment of soul, mind, and body is prophetic of his future.

Here, then, man stands as the terminal bud of the tree of life, the end of a mighty process,

with a meaning which interprets the process, but which cannot be identified with it. "In the beginning psychical life was but an appendage of the body, in the end the body is the vehicle of the soul." In the light of purpose, this means something. "If we can imagine," says Professor Fiske, "a future time when warfare and crime shall have been done away with forever, when disease shall have been for the most part curbed, and when every human being by moderate labor can procure ample food and shelter, we can also see that in such a state of things the work of civilization would be by no means completed. In ministering to human happiness in countless ways, through the pursuit of purely spiritual ends, in enriching and diversifying life to the utmost, there would still be almost limitless work to be done. I believe that such a time will come for weary and suffering mankind. Such a faith is inspiring. It sustains in the work of life, when one would otherwise lose heart."

It is indeed a noble hope and faith, and the process means this in truth, must mean this at least. But does it mean no more than this? Such an outcome is grand, but ephemeral. Earthly civilization, no matter how complete, must one day pass away. The earth, science tells us, is but a cooling cinder, and the time must come when it will be no longer fit for human habitation. The tribes of men on its surface are but as fleeting shadows. Such an outcome is less durable in the scale of the vast process than the fabric of a dream, and its very grandeur only emphasizes its failure. Even fully developed humanity is only the prelude to extinction. Some end other than this, some faith higher than this, must justify our belief in the "reasonableness of God's work."

CONCLUSION.

THERE can be but one conclusion in terms of the rest of our knowledge. Happiness, enjoyment, the enrichment of life, these are pleasant things, but this earth, as science reads its future, cannot be their lasting abode. They are a means but not an end. They have their purpose in the scheme, and work toward the final aim. Misery, want, warfare, disease, crime, sin, sorrow — these we call evil things. We even question why such things should be, and call their existence a mystery. But these, too, are means to the same end, a part of the same process, neither more nor less mysterious than all the rest, and must play their part also in the attainment of the final aim. This aim may well be happiness in the end, but that end is not here. Here the road is *designedly* thorny, and passed with suffering. Such happiness as we

find here is ever and always the outcome of intelligent voluntary action in obedience to the guiding will. It is well and right to strive for happiness here, because its attainment is linked to righteousness. It is thus an incentive to impel us on, at once a motive power and a promise of the future. It has no meaning divorced from the future. Here is surely no mystery. Suffering we find ever and always the result of violation of law, whether wilful or ignorant. It is in our power to diminish it. It is right and proper thus to strive. It is both an incentive to such effort and a scourge to disobedience. It works in the same direction as happiness, and to the same end. Happiness itself loses meaning without it. Why should we seek to make a special mystery of this, as though man had an inalienable right to happiness apart from voluntary right action?

Could we not then have been set in a world of happiness perennial, free from sorrow, care, suffering, and sin, where disease and crime should be unknown, and man could live in blissful ease, a stranger to pain? And what then? Beginning with such a stage, man would have no future. Then, indeed, the reason for his existence would cease with his organism. Death itself should be unknown in such a world, or else it must be a world without human affection. In such a world there is no future outlook, no progress, no discipline, no self-development. In such a world freedom of will would have no significance, voluntary action no moral consequence, choice would be meaningless, obedience a figment, character an impossibility. Why should such an automaton live forever? Why should such a colorless, fiberless ghost and nonentity live at all? Without happiness as the reward of conscious striving, without suffering as the punishment of disobedience, without conscience, duty, self-development, such an Eden would be stripped of all meaning, and would stultify the power that produced it. The millennium of Professor Fiske may well be the end, but it must be the result of our coöperation, an attainment, not a gift falling to heedless hands. We must take into it those self-developed qualities of soul and spirit, which it alone could not produce, but which, once produced, are eternal, and the previous existence of which alone can render such a state desirable. These qualities we must ourselves attain; for this reason we are here, to attain self-hood. For this we have the gift of conscious personality, the consciousness of freedom, the ability to choose, the responsibility of choice. Here we find the true meaning of this our life, and begin to understand the mystery of pain and sin. Intelligence is ours, to guide but not to govern us. We must govern ourselves. We must voluntarily conform to the supreme will,

and not find ourselves without effort in accord with it. Our intelligence itself we must attain to; it is not furnished ready made. We must learn by pleasure to pursue the right, by suffering to avoid the wrong. Violations of law due to the ignorance of one generation become the voluntary transgression of the next, and sin appears; as the result of ignorance, suffering, and as the result of knowledge, wilful wrong action and sin. The physical struggle is now transferred to the moral and spiritual side, and through sin itself the struggle with self begins. Mastery of self can be attained only in a world where temptation and sin are possible, where voluntary disobedience is the outcome of ignorant transgression. These are necessary to the end; not merely allowed, but designed. The purpose of such a world is plain to read. It means that not happiness here is the end for which we are to strive. That is a means to help us, to encourage us, to lead us on. Not the avoidance of pain is the end. That also is a means to warn us, to guide us, if needs be to compel us. But the great end which science itself is forced to recognize is the mastery of self through the struggle with sin and temptation, and the formation of a personality—of a character self-attained, of a spiritual influence in the midst of a universe governed by such influences which, disciplined by pain and trial, strengthened by the sweet uses of adversity, guided by reason and knowledge, voluntarily brought into accord with supreme will through the stress of sin itself—is thus made capable of coöperation with that will both here and hereafter. This is the significance of the process we observe. This alone harmonizes all the facts. For such a personality there must be a future. Such a personality belongs to the meaning of the universe. Not, therefore, the production of automatons who may pass a few years of blissful irresponsible ease and then cease to be; nor the development from lower forms of an animal who can for a time explore nature, increase in power and civilization, develop a higher nature, stretch forth hands of entreaty to an unseen God, and then, just as the universe opens to his gaze, when higher possibilities and hopes and yearnings begin to dawn, when he has grown completely out of his physical environment, and with an endowment far beyond his needs catches glimpses of glories he can never share, and with heart filled with loving longings that can never be satisfied, sinks into a hopeless grave—such is not the end indicated by the facts. Such an end is worse than futile. It is a cruel mockery.

But the development of a conscious inde-feasible personality,

One soul against the flesh of all mankind;

of a spiritual energy in accord with eternal purpose, capable of coöperation and fit tool for higher things — this is an end which alone satisfies reason, science, revelation, faith, and hope. This alone is commensurate with the whole mighty process. The attainment of such

a personality we begin here. So surely as we begin it has our true life begun, and opportunity must be afforded to complete the work — else is the whole process a failure. And this personality, science tells us as certainly as she can tell us anything, is not born to die.

Augustus Jay DuBois.

SYMPATHY.

BY us she waits, unglorified and meek,
 Forgotten in the blessings that she brings.
 We do not deem her eyes conceal the springs
 Of all the streams of gladness that we seek.
 Until she wills kind words we cannot speak,
 Lacking her hint the angels fold their wings.
 How soft her touch, and how for feeblest things
 The smiles and tears run races on her cheek!
 Without her counsel Love might go astray,
 Or Charity itself would cast a chill,
 And Happiness on earth be but a name.
 Her golden key unlocks the poet's way,
 Else Genius, nathless all his mighty will,
 Might stumble blindly at the gate of Fame.

Charles H. Crandall.

FROST-FLOWERS..

FROST upon my window-pane,
 Delicate flowers in frost —
 Thus the old dreams come again,
 Dreams of the loved and lost.

Not the buds of early spring,
 Not from the fields of June,
 Fruit of ghostly blossoming,
 Under the winter moon.

Fern and lily pale and sere,
 Drawn by an airy hand,
 Etched by night this time o' year,
 Blossoms from No-man's-land.

Thus, mayhap, long after death,
 Strangely as flowers in frost,
 Thoughts of us who still draw breath
 Come to the loved and lost.

W. P. Foster.

THE GOLDEN AGE OF PASTEL.

HE hopes of rendering some service to the art of painting with crayons, and of explaining its principles for the benefit of such as in this age of dissipation may prefer the silent amusement of a beautiful art to the delusive enchantments in the gay circles of unrestrained pleasure, have induced me to this undertaking.

So wrote John Russell, R. A., portrait-painter in pastel to his majesty George III., in his work, "The Elements of Painting with Crayons," published in 1777. Pastel-painting is indeed a beautiful art. Its delicate purity of color and its delicious crispness of texture lend themselves more easily than any other medium to the reproduction of feminine beauty and the exquisite complexion of childhood. It is to oil-painting what the vaudeville is to the tragedy, or the sonnet to the epic, and in the hands of a master it can show all the vigor and depth of oil. Easily destroyed if left unprotected by glass, the medium was at first regarded with suspicion, and its durability questioned; but paintings made a century and a half and even two centuries ago still retain the same lovely qualities with which they delighted the beholder when fresh from the artist's easel, while some oil-paintings of the same period have sunken in and blackened. This is only what we ought to expect, for a piece of pastel is pure color. All that chemical action can do has been effected in the absorption of the pigment by the chalk. No oil or varnish is mingled with the paint to darken as time passes and to obliterate or obscure the original hues. When pastels have faded we must conclude that poor pigments were originally used, for the delicate tints of the earliest masterpieces enjoy an immortal youth which years cannot destroy. The most insidious enemy of pastel is dampness. Mildew may dim the colors if the paintings are hung in moist climates or in seaside cottages; but properly protected by backing and glass, and in our dry atmosphere, there is nothing to fear.

John Russell's hope of rendering service to the art of pastel-painting was fully realized in his portraits, if not in his somewhat didactic and tedious book. His paintings, wonderfully clear and fresh in color to-day, amply prove the durability of the material, while his genius as a painter showed that its possibilities were no whit inferior to oil. The pastels of Russell

hold their own in loveliness and artistic perfection beside the portraits of Gainsborough and Romney.

Born in 1744 in Guildford, in the beautiful county of Surrey, he came to London at the age of fifteen and devoted himself to art with such success that he soon became the popular painter of the fashionable world. It was a very naughty world, as we well know, but "the silent amusement of his beautiful art" kept him from its "delusive enchantments." He had another scholarly taste, a penchant for astronomy, and he found time to invent an instrument to show the phases of the moon, and to write a work on that luminary which he illustrated with engraved plates.

An explanation of this unusual combination of tastes so incongruous as those of astronomy and art was given us by the grandchildren of the famous astronomer Sir William Herschel. While visiting them at Observatory House, near Windsor, the remark was made that the best portrait of their grandfather was a pastel painted by his friend Russell, now among the art treasures at Guy's Cliff, Warwick. It pleased George III. to affect to patronize men of letters and of science, and when Herschel's wonderful discoveries electrified the world, the king created him Astronomer Royal, and presented him with a patent of nobility, and in the gay circles of court life Russell made one friendship which colored his entire life.

Our first acquaintance with the works of this master came about through a happy chance.

We had gone abroad on a pastel pilgrimage, our plan being to search the galleries of Europe for examples of the beautiful works done in this medium in the last half of the seventeenth and during the eighteenth century—works which have proved the inspiration of the brilliant galaxy of French painters, to whom is due the present renaissance of the art. Our quest was richly rewarded in Germany, Switzerland, Italy, and especially in France, but at the outset only discouragement met us in England. There are no pastels in the National Gallery, and only an insignificant number in the South Kensington and other museums; but very opportunely there came to us an invitation from Mr. Edwin Lawrence, a munificent patron of the South Kensington Museum. "Come and lunch with us," he wrote, "and see my collection of pastels by J. Russell, R. A." It was a rich collection. Mr. Lawrence had found in the hands of an art

"CHILD WITH CHERRIES."

PASTEL BY JOHN RUSSELL, R. A., IN THE LOUVRE, PARIS.

dealer the portfolios of unfinished sketches and studies for portraits accumulated in the artist's studio during his long career as court painter, and had pounced upon them with the sagacity of a connoisseur. Many of the portraits were torn across, and these the present owner has restored with much skill and taste. The paintings had been subjected to the roughest usage, having tumbled about in odd corners unprotected by glass for upward of a hundred years. Now exposed to the light, now rolled or crumpled, the paper has become ragged; but the colors are exquisitely fresh. Mr. Lawrence has been very generous, sharing his treasures with the South Kensington Museum and with friends, but his collection is still unrivaled. Nagler gives a list of the portraits painted by Russell, which includes nearly all of the celebrities of London of that period.

His portraits of his fellow artist, John Bacon, R. A., and of Mrs. Bacon, have been lent to the South Kensington Museum by Miss E. S. Bacon. A very popular picture, his "Child with Cherries," is in the Louvre. In style it reminds one of Sir Joshua Reynolds, and has recently been reproduced for several art journals.

But with the exception of the works of Russell our pastel researches in England were destined to meet with disappointment. The portraits by La Tour, Liotard, and Rosalba Carriera, many of which exist here, are hidden away in private collections. It is in the museums of France that admirers of pastel will find the best representations of its golden age, in the works of La Tour and his great contemporaries.

The real inventor of pastel-painting is unknown to history. It is possible that the perfected art was developed very slowly from the drawing in crayons of which the early Italian painters were so fond. A drawing, executed in black, white, and red chalk by Frederigo Barroccio, bearing the date 1528, is in the Dijon Museum. To these three colors others may have been gradually added until the crayons arrived at the full gamut of the portrait.

Robert Nanteuil and Charles Le Brun (1619-1690) have left us numerous pastels of such excellence as to prove that they were not the first who have used the medium.

A gap of half a century occurs between their latest portraits and the first of the galaxy of pastelists who appeared during the reigns of Louis XV. and Louis XVI. Nevertheless, Le Brun's portrait of Louis XIV., in the pastel room at the Louvre, is so characteristic that it deserves special mention. Bombastic, theatrical, selfish, and unscrupulous, the Grand Monarch stands revealed to us as in a magician's mirror. Le Brun was able to keep his place throughout life as the king's favorite painter. He has been

rightly called the Louis XIV. of art, for he perfectly expressed the theatrical and grandiose taste of his royal master. Le Brun's pupil Vivien is the only link to connect him with the golden age. His color was hot, and his paintings do not usually attract us; but he gave the medium the same seriousness of effort which others gave to oil, and in the museum at Rouen we came across a most admirable portrait by him.

The Italians make a claim to the invention of pastel based on the fact that the name used by all nations for the material is derived from the Italian word *pastello*, signifying little rolls of paste. Whoever may have first discovered the medium, it is to a gifted Italian lady that we probably owe the prevalence which the art obtained in France during the latter half of the eighteenth century, and the impulse received about the same time by English and German artists.

Rosalba Carriera was born in Venice in 1675. She early attained great honors in her native country, was elected a member of the academies of Bologna, of Florence, and of Rome, and painted the portraits of many noted Italians, among others that of the Grand Duke of Tuscany, Cosimo III. In 1720 she made a visit to France, accompanied by her mother and sisters. Her stay was marked by a series of ovations. Vivien's popularity was due rather to the novelty of employing the material for large paintings, and for dark and sumptuous accessories, than to any real genius in the painter, and Rosalba's management of pastel was a revelation to the Parisians. She painted the king, Louis XV., then only ten years of age, and during the year of her stay was the most popular woman in Paris, receiving the most distinguished hospitality and flattering social attentions. Watteau, Vivien, and the other leading artists of the day gave her the most generous recognition, and on the 26th of October she was received with acclamation as a member of the French Academy. She is described as forty-five years of age, not beautiful, but possessing grace, modesty, and charm, which set off her rare talent. She received more orders during her Parisian visit than she was able to execute, and returned to Venice delighted with her French experience. Three examples of her work are preserved in the Louvre, all portraits of women, displaying great delicacy and grace of treatment, but painted on a rather white and chalky key when compared with the glowing carnations of Prud'hon and Chardin. Her name Rosalba, white rose, is said to have been a sobriquet given by her friends, possibly on account of the very light and delicate tints which she affected. After her return to Venice her popularity increased. She painted so many traveling Englishmen that the number

A VENETIAN LADY OF RANK.

PASTEL BY ROSALBA CARRIERA, IN THE DRESDEN GALLERY.

of her works still preserved in England gave rise to the impression that she had visited that country. She is mentioned in Russell's work on pastel-painting, and Russell was doubtless familiar with her portraits, perhaps receiving his inspiration toward that medium from them. In 1730 she was called to the court of Vienna, and the King of Saxony, Frederick Augustus, acquired a number of her paintings, which are now in the Dresden Museum. It would be interesting to ascertain whether any pastels of real merit were produced in Germany before this date. If not, whatever nation may have invented the material, to the White Rose of Italy belongs the honor of the first propagandism of the perfected art. At every station of our pilgrimage we found some example of her work. In the fascinating Museum of Arts at Dijon—which has grown out of the old palace of the Dukes of Burgundy—we discovered four of her most characteristic and lovely portraits; at Innspruck were two in her style, and purporting to be her work, but of doubtful authenticity; but it was at Venice, as might be expected, that we found her at her best. Twelve of her finest portraits hang on the walls of the Academy of Fine Arts, the old assembly hall of the brotherhood of Santa Maria della Carita. They are the legacy of Count Omobon Astoria, and are chiefly of members of the Astoria family. The Astorias were men and women of marked and varying characteristics, for the collection shows two ecclesiastics of gentle, studious mien, two nobles in curled wigs and brocade, with handsome, luxury-loving features, one stern old woman, elegant ladies in delicate shades of satin set off with flowers and jewels and exquisite lace, and two beautiful children. But by far the most interesting portrait in the collection is that of Rosalba, painted by herself. She is robed as richly as the Astoria ladies; there are great pearls in her ears, and yellow chrysanthemums relieve her brunette complexion; the face is of such dignity and intelligence that we quarrel with the French writer who said that she was not beautiful.

Rosalba died in Venice at the age of eighty, working up to her last decade, when she lost her sight and a little later her reason.

Italy did not retain the preëminence which she had gained, and it is to France that we must look for the finest display of the art. It flourished most brilliantly during the latter half of the eighteenth century.

In 1704 the town of Saint-Quentin in Picardy gave to the world a painter of extraordinary original genius, Maurice Quentin de La Tour. To his personal work and to the influence which he exercised upon his contemporaries and followers is due the golden age

of pastel. The names of all other pastelists of this time group themselves about La Tour, and after his death the art fell into speedy decadence. La Tour's father opposed his desire to become an artist. The boy had his own way to make, and while pursuing his studies in Paris he made cheap portraits, choosing pastel as a medium, because of its rapidity of execution. From the first he displayed a marvelous aptitude for catching a likeness, and though at this period his work was immature and careless, it caught the popular fancy, and he speedily sprang into notoriety. As money came to him he wisely declined orders, preferring to give himself to more serious study, thus improving the quality of his work. In 1737 he made his first appearance at the Salon, exhibiting a portrait of Mme. Boucher, and one of himself.

Standing before Mme. Boucher's portrait one is not surprised that it gained for him a great artistic and popular success. His fellow artists recognized a painter of marvelous power in depicting character and of great originality of treatment. The populace were attracted by the strikingly lifelike qualities of the portraits. This homely, honest man, with his slightly ironical smile but kindly eyes, seemed to look them through and through with a quizzical expression which was not to be resisted. There was no attempt to parade technic; it was nature itself. The crowd lingered before his pictures, and came again and again, attracted by the same magical spell. The critics could only blazon abroad the universal opinion that a new master had appeared in France. From that time his success was assured, and the small shopkeepers of Paris lost their little painter of rapidly made portraits at four dollars a head.

He did not, however, desert the mistress who had made his fortune, and La Tour did as much for pastel as pastel had done for La Tour. Thoroughly enamored with the medium, he devoted himself exclusively to it throughout his long life, giving it an unprecedented vogue, placing it side by side with oil-painting, and proving it the equal if not the superior of the older manner of painting for the perfectly naïf representation of nature.

His popularity increased each year. The critics declared it impossible for art to go beyond his work in its perfect resemblance, its delicacy of color, and its grace of style. Louis XV. became his chief patron, and for forty years from the date of his first exhibition he was the leading portrait-painter of his day. He painted nearly all the noted men of his country and age, preferring, we are told, to make the portraits of celebrities for his own pleasure to painting those of opulent nonentities at any price. In spite of this assertion he showed himself an able man of affairs, speedily amass-

ing great wealth from his extraordinary prices, finding fault with the sum, twenty-four thousand francs, paid him by Mme. de Pompadour for her portrait, and claiming that he should have received double that amount. Ten thou-

sented in armor magnificently painted, relieved by the blue sash of the order of Saint Esprit. It is said that the marshal, who was a great friend of La Tour's, had fallen into disgrace with the king, who, in consequence, had con-

LOUIS OF FRANCE, THE DAUPHIN. PASTEL BY MAURICE QUENTIN DE LA TOUR, IN THE LOUVRE, PARIS.

sand dollars seems to us a rather exorbitant demand for a portrait in pastel, but there was only one La Tour, and this was his masterpiece. It is doubtful whether it has ever been excelled. Universally conceded to be the most important picture in the pastel room of the Louvre, "it is the despair of all pastelists and also of all painters in oil." The accessories are cleverly treated, while the lady, from her blond tresses to the high heels of her dainty shoes, is a delicious bit of painting. The delicate-flowered satin gown, the lovely hands and bosom, and the small but perfectly shaped features, are all exquisitely rendered. The head, we know not for what reason, was cut out of the picture at the time of the Revolution, and has been replaced. The painting forms a striking contrast to La Tour's strong portrait of Marshal Saxe, which hangs on the next wall. He is repre-

fiscated his possessions. La Tour, knowing him to be in want, interested Mme. de Pompadour in his behalf while painting her portrait, and she interceded with the king with such success that the marshal was reinstated in royal favor.

Louis XV.'s portrait by La Tour was painted in his prime, and shows a dashing handsome face slightly marred by a disagreeable mouth. The portrait of his wife, Marie Leczinska, an insipid but smiling beauty, hangs beside his own. La Tour painted their son, Louis of France, more than once. The portrait, which represents him as a young man, resembles his father, but the face is softened by the mother's amiability, and is singularly innocent in its expression. The dauphin never came to the throne, for his father outlived him. His character was gentle and lovable, and he was deeply regretted by

JEAN-ÉTIENNE LIOTARD, PASTEL BY HIMSELF, IN MUSÉE RATH, GENEVA.

all who knew him. La Tour's portrait of the dauphin at the age of eight or ten is still more charming, for here he is represented in perfect health, with no premonition of early death in the plump face and pouting lips. His hair is puffed and powdered, and tied in a queue, and he wears a stiff little stock and a frill of delicate lace, which falls upon a satin coat of pale rose-color decorated with the rich silver star and the broad blue ribbon of Saint Esprit. But in spite of this courtier costume the little prince is not one bit priggish or affected. The beautiful dark eyes sparkle mischievously, and the retroussé nose has a saucy turn. He is a bewitching mother's darling, whose loveliness of feature and character explain the satisfied smile on Marie Leczinska's face—a smile which could not have been occasioned by the treat-

ment which she received from her handsome husband.

Rich as the Louvre is in fine examples of La Tour, the town of Saint-Quentin possesses a still greater number of his works. He was always fond of his birthplace, and when he returned to it at eighty his fellow townsmen welcomed him with acclamations of joy. The church-bells pealed chimes of welcome, and the inhabitants, in holiday attire, headed by their magistrates marched to meet him, while in the evening all the houses were illuminated. They had reason to love him, for he had done much for Picardy. He left to its principal city, Amiens, ten thousand francs, the income of which is given each year "to the author of the most beautiful action or of the most useful discovery in Picardy." But the sums given during his

life and at his death to Saint-Quentin amounted to a hundred thousand dollars, distributed between different charities and in the founding of a school of design. He had left his home a poor boy; he returned wealthy, to make his native town his principal inheritor. For four years he lived quietly and peacefully, an eccentric old man of whom many whimsicalities are related, but who was nevertheless greatly beloved. He left a large collection of pastels, which he had made for himself, to his brother, who in turn left them to the museum of the art school which the artist had founded, where they form a unique and interesting collection, unknown to the world at large, but well worthy a pilgrimage to any lover of art.

Contemporary to La Tour there appeared in different parts of Europe a comet-like genius called, from his Oriental costume, *Le Turc*, the Swiss painter Liotard. His extraordinary ability as a pastelist was acquired during his residence in France, but the Louvre has no examples of his pastels. It is fortunate, however, in possessing thirty masterly little sketches in red chalk made during his travels in the Orient. Versailles has merely a copy of his pastel portrait of Mme. d'Épinay to show his peculiar piquant charm and cleverness in the management of his material. Happily, other European galleries are richer in examples of his talent. Born in Geneva in 1702, Liotard began his career as a miniaturist and painter in enamel, but, coming to Paris, he became devoted to pastel. The French ambassador to Naples took him to Italy in his suite. At Rome Liotard met some wealthy traveling Englishmen, who persuaded him to join them in a tour to the Orient. He remained for several years in Turkey, adopting for convenience the costume which he never entirely relinquished, and allowing his beard to grow. In 1742 he paid a visit to Vienna. It happened that just at this time the Count Dietrichstein had committed the misalliance of marrying his pretty servant. All Vienna was shocked, and Liotard had the good fortune to be able to paint the portrait of the bride, which was at once the observed of all observers. It was a happy combination of *réclame* and real merit, for the painting was the now celebrated picture known as "*La Belle Chocolatière*." It was immediately purchased at a high price, and is now one of the jewels of the Dresden gallery. The event led to an order by Maria Theresa for her portrait, and Liotard's future was secure. He returned to Paris preceded by his reputation. His Turkish turban rendered him conspicuous. The king ordered a number of miniatures, to be set in diamonds and worn as bracelets by the queen and other members of the royal family. But the old passion of roving was unquenchable,

and patronage could not chain him to Paris. He crossed to England, when he painted the Countess of Coventry, Garrick, and other celebrities; wandered to Holland, where he executed portraits in pastel of the Prince of Orange and Nassau, and of the Duke of Brunswick, and where he succumbed to the charms of a little maid of Amsterdam, who consented to marry him after having first induced him to shave his beard. He settled down at last in his native town, where he died in 1790, leaving the city some of his best paintings. To Geneva, therefore, we came in our pastel pilgrimage. We found three of his celebrated portraits at the Rath Museum—the original of Mme. d'Épinay, copied for Versailles, his Maria Theresa, and his portrait of himself, painted before Love had shorn his flame-like locks and Turkish beard. He chose to depict himself using the crayon-holder, the badge and implement of his profession.

The works remaining in his studio at the time of his death were left by Mme. Liotard to the museum at Amsterdam.

One of La Tour's most characteristic portraits is that of his friend, the artist Siméon Chardin. Another pastel portrait of Chardin, painted by himself, hangs in the same gallery of the Louvre. Comparing the two, we find that Chardin has not flattered himself, for his portrait, exceedingly broad in treatment, shows only a strong, homely face, with spectacles on nose, and crowned by a grotesque sort of night-cap, or turban. There is nothing to indicate the rare intelligence, the genius for composition, which was rather a faculty for the discovery of harmonious relations of things, the prompt, assured grasp with which he seized the artistic aspects of nature, and his naïf but masterly interpretation of the effects of light. He was by nature a colorist, reveling in sunshine. He was born in 1699, making his appearance, as Charles La Blanc tells us, just as the pompous art of Louis XIV. was disappearing, and the affected art of Louis XV. was coming on, though he had no affinity with either style. Diderot wrote of him: "He has no style. I am wrong, he has his own; but since he has a style, he must be false in certain circumstances—yet Chardin is never false." It was this childlike following of nature, as it was given to Chardin to see nature, which made him an original genius. His paintings at first were unambitious—still-life subjects painted with great fidelity, and with a caressing touch which told how he delighted in their representation. He afterward turned his attention to figure-paintings, painting scenes of domestic life with much delicacy of sentiment and honesty of feeling. One genre painting, "*Le Bénédicité*," is famous. It represents a little girl with folded hands

THE DAUPHIN, LOUIS XVII. PASTEL BY MME. VIGÉE LE BRUN.

repeating her grace before meat, while her hungry glance wanders slyly to the plate of steaming soup which her gentle mother holds ready for her upon the completion of the prayer.

In all of the mothers whom he painted it is said that a resemblance is traceable to his wife, Marguerite Pouget of Rouen. His portrait of her, painted when he was seventy-seven, is one of the treasures of the pastel room of the Louvre. Reiset says of this portrait, "La Tour himself never painted a better." The face is

full of "the beautiful lines of experience" and the ripest and richest coloring. It beams as with an inner light, irradiating intelligence, benevolence, sweetness of disposition, matronly grace and good sense, and a certain all-pervading motherliness, which makes us exclaim, as Diderot did before the pictures of Greuze, "One sees well that this man loved his wife." Chardin received moderate appreciation while he lived, and was speedily forgotten. This beautiful portrait, together with his own, was sold thirty years after his death for twenty-

four francs! Real merit could not long suffer such oblivion, and the fame of Chardin has of late been disinterred.

A great contrast to this quiet, domestic life, its moderate ambition satisfied, its entire course so tranquil and blessed in every aspect, is the stormy career of another great colorist, Pierre-Paul Prud'hon.

He was the son of a master mason, born in the provincial city of Cluny, so noted for its Romanesque houses and its beautiful old monastery, for which the Cluny Palace at Paris was merely the abbot's city residence. It was in this monastery that Prud'hon received his education and his first impulse toward art. Here indeed he reinvented oil-painting, for being told while engaged in attempting to copy one of the altar-pieces that he would never succeed, as it was *painted in oil*, the boy of fourteen set to work to experiment, messing together various dye-stuffs with salad oil, doubtless greatly to the despair of his good mother, until he succeeded in furnishing his palette with the colors which he required. But although he afterward attained eminence in oil-painting, Prud'hon's peculiar talent as a colorist found its best expression in pastel. His sketches and schemes of color for his oil-paintings were made in chalks. A very lovely study, a half-nude figure, said to be a sketch for a figure in one of his large compositions, is one of the chief ornaments of the pastel room of the Louvre. The coloring, attitude, and expression of this study are all very lovely. The hair is reddish gold, and the flesh tints are the rich carnations when the milky blond complexion is warmed by a touch of auburn fire. Prud'hon was the French Correggio, but a hint of melancholy broods over his most joyous creations. He had a sensitive, poetic nature, which was embittered by an uncongenial marriage, and by early struggles with an adverse fortune. He worked incessantly, and when *la grand peinture* failed, decorated *bonbonnières* with cupids for confectioners. Unable to feed his family with bonbon boxes, pastel portraiture attracted him by its rapidity of execution, as it had first appealed to La Tour, and he left Paris to make a tour through Franche-Comté, painting portraits at the village/inns at a single sitting.

During this trip the itinerant artist made the acquaintance of a certain M. Frochot, a man whose friendship was destined to stand him in good stead a little later. Prud'hon had a peculiar faculty for making friends. There must have been something irresistibly attractive in his personality, for all who knew him loved him, and it was to his friends that he owed the success which his genius merited, but which he was not sufficiently self-assertive to claim. M. Frochot became prefect of the

Seine, and in his prosperity he remembered the traveling painter of pastels who had interested him so much in Franche-Comté. He sought Prud'hon out and invited him to dine, telling him at the dinner that he wished to order an important painting for the criminal courtroom. A sudden inspiration came to the artist, and he rapidly sketched a design of the picture which afterward made him famous, "Vengeance and Justice Pursuing the Criminal." When the painting was finished his friends counseled his exhibiting it at the salon of 1808, together with his "Psyche Carried Away by the Zephyrs." Another friend of Prud'hon, Guizot, the historian, was then a young man who amused himself by writing art letters for the public press. He was profoundly impressed by the varied powers displayed in these two pictures, and he heralded in glowing terms the advent of a new genius. The praise of the art critic had its effect on the career of the artist. It drew the attention of the public, possibly that of Napoleon, to the pictures. The emperor decorated Prud'hon with the cross of the Legion of Honor, and ordered a portrait of the Empress Josephine. His fame as an artist was secured, and for a time fortune seemed to smile upon him. It was but a delusive gleam, and Prud'hon's life closed early under a cloud of domestic misfortune, the inevitable result of his own erring conduct.

La Tour's success had given such popularity to pastel, that there immediately sprang up an overwhelming number of pastelists of more or less talent. It became the fashion to have one's portrait painted in pastel, and there were painters of the first order for great purses, and mediocre painters for little ones. The medium was especially affected by women painters, two of whom, Mme. Vigée Le Brun and Mme. Guiard, deserve to stand in the first rank with their brothers of the crayon. The same year, 1783, saw them both created members of the Academy.

Adelaide Labille Guiard, afterward Mme. Vincent, was a pupil of La Tour and of the miniaturist Vincent. She possessed remarkable talent, and although she did not attain the celebrity of Mme. Le Brun, her paintings have a power and charm which prove her the peer of her famous rival. The Revolution found her popular with the nobility, but she was pardoned this favor of the aristocrats, and enjoyed the patronage of the new régime, painting the portraits of Robespierre, Talleyrand, Beauharnais, and others. It was the dying effort of pastel-painting, which was completely crushed by the Revolution. There is a charming example of her work in the Louvre, a portrait of a handsome man in a light-gray satin coat. Few tourists find it, for the guides do not point

it out, and it is skied in lofty loneliness over one of the doors.

Mme. Le Brun held the same position for the court of Louis XVI. that La Tour had occupied during the preceding reign. She was the friend of Marie Antoinette, and her three portraits in oil of this lovely and unfortunate queen look down upon us from the walls of Versailles. She painted the dauphin in pastel, the little prince about whose death in the prison of the temple there rests so much of mystery. Mme. Le Brun's pastel of the dauphin hangs in what was formerly his bed-chamber, in Le Petit Trianon. He is represented at nearly the same age as La Tour's charming dauphin of the Louvre, and wears the same decoration, the blue ribbon and silver star of Saint Esprit; but here the resemblance ends, for his long dark hair is unpowdered, and there is something almost plaintive in the sweet expression.

Mme. Le Brun's art was identified too closely with Marie Antoinette to obtain any great success after the death of her royal patron. Like Mme. Guiard she painted a few pastel portraits during the Revolution, adapting herself to the change in the temper of the times with wonderful tact. The account in her memoirs of the impromptu Greek dinner given in her studio is a proof of this adaptability, as well as of the power of the classical renaissance. The dinner was a pretty *pièce de théâtre*, arranged with charming spontaneity; but the theatrical spirit was destined to stifle everything that was natural and simple in art. Mme. Le Brun was one of the last French pastelists of note of the period. Johann Heinrich Schroeder, the German court-painter, at this time was very popular, and has left many charming pastels of the beauties of his country; none lovelier than the celebrated pastel portrait of the Countess Potocka in the Berlin gallery. But the golden age of pastel-painting was drawing to a close. The works of the painters La Tour, Chardin, Prud'hon, and Mmes. Le Brun and Guiard had begun and carried it to its height in France. The modest pastel room of the Louvre, to which we have referred so frequently, may well be said to inclose "infinite riches in little space," for here are to be found excellent examples of these artists, and of the English painter John Russel, of Rosalba Carriera, and of many others less known but scarcely the inferiors of those we have mentioned.

Among these are Ducreux, La Tour's pupil, represented by an admirable laughing portrait of himself, and Perroneau, the rival of La Tour in later years, whose delicate color and graceful treatment never received full recognition during his life, having been overshadowed by the fame and popularity of his great contemporary. Here, too, are Mme. Sturel Paigné, with her magnificent flower-pieces; Lundborg, a Swedish artist, pupil of Rosalba Carriera, whose portraits of the artists Boucher and Natoire are highly finished and lovely in color. Charles Le Brun and Vivien are represented by the ostentatious grand seigneurs with whom they were so popular; and there are many charming studies by other pastelists whose names are unknown or whose fame is forgotten.

In the neighboring room of drawings are the sketches in red chalk by the Swiss pastel-ist Liotard, and others in the same material by Watteau, Boucher, Fragonard, and Portail. It seems almost impossible that these artists did not use pastel, as the medium is so well adapted to their graceful style.

At the beginning of the nineteenth century the hour had struck in France for a change in its art as well as in all of its institutions. It was the birth of the Republic. Henceforth no more of the graceful art of beauty and pleasure, of delicate tints and poetic sentiment. Romance, gallantry, amusement, refinement, and playfulness were all swept away by the great tide of emotion. Prud'hon fought during the latter part of his life for the art of pure beauty, but he was overpowered by the rising popularity of a new genius, David. The French Revolution had modeled itself on ancient republican institutions, and David sprang to the front with a renaissance of classical art. Oil-painting was his chosen medium, and the beautiful art of pastel faded from view.

But the medium is too lovely to suffer this ignoble neglect. So well adapted to the art of the landscapist, the flower-painter, the painter of still-life, and, above all, to the requirements of the portrait-painter, it was to be expected that the turn of a century would bring it again to the surface, and that the renaissance of pastel would find among its most enthusiastic adherents the colorists of the day.

So strong is the movement lately begun by the leading French artists that we may even hope that the renaissance will surpass the brilliancy of the golden age.

THE CENTURY'S CHRISTMAS PICTURES.

THE SPIRITUAL AND IMAGINATIVE IN MODERN ART.

MODERN French art has often been reproached for its materialism, for its tendency to exalt the technical side of painting at the expense of the intellectual, spiritual, emotional side.

Artists of an elder day, we are told, while displaying the most magnificent technical skill, made careful choice of a subject, and won their highest glory by the heartfelt and personal manner in which they interpreted it; but living French artists—and by reason of their influence living artists in general—are content with any subject that will permit them to show how well they can paint, and even when they label it with a name which suggests an intellectual or spiritual meaning, are content to let this meaning reside wholly in the name. They care, we are told, a great deal for painting as such, but very little for the ideas or feelings that it may convey. They seem to have wonderfully gifted eyes and fingers, but no hearts or souls; great skill and sometimes great individuality as craftsmen, but no personality as artists in the highest sense.

Such statements are undoubtedly true as regards most of the painters of to-day. The majority of figure-pictures in all recent exhibitions which have borne idealistic titles have been merely portraits of studio or peasant models, revealing nothing more than that the painter had had a keen feeling for the external, prosaic facts that had lain before him.

But a glance at the pictures which are reproduced in this number of *THE CENTURY MAGAZINE*, illustrating the scenes of the first Christmas season, will show that this general tendency in current art is not without conspicuous exceptions; and also, perhaps, in view of the comparative youth of their painters, that the tendency itself is changing. They represent artists who

have risen to great distinction in very recent years, and they prove that each of these artists has treated an idealistic subject in a way as adequately imaginative as it is personal, individual.

The finest of all, to my taste, is Dagnan-Bouveret's "Madonna." I need not speak, from the strictly pictorial point of view, of its singular charm, distinction, and originality as a composition, or of the beauty in color and handling which we know must exist in any canvas painted by this masterly hand. I wish merely to draw attention to the tenderness and truth of the sentiment rendered by the mother's attitude and expression and the pose of the baby's helpless little head. Each observer must decide for himself whether the fact of sacred, supernatural maternity is perfectly expressed—whether the picture really shows a madonna in the traditional, emblematic sense. But I am sure all will feel that it is at least a most veracious, touching, and poetic picture of motherhood, that the artist has keenly felt and sympathetically interpreted the inner suggestiveness as well as the outer aspect of the lovely group. To my mind this is one of the most beautiful of modern paintings; and its beauty is in part technical, but in large part intellectual, emotional.

The spiritual quality of much of the work of Bastien-Lepage is well known to all students, though he is often called the most pronounced of realists. We have seen it revealed in his familiar "Jeanne Darc," and we see it again in this "Annunciation to the Shepherds." In the German Uhde's triptych we have an astonishingly interesting combination of realistic treatment, based upon a study of the peasant life of to-day, and of sincerely imaginative feeling. And the remaining pictures of the group teach us similar lessons with regard to the persistence of an intellectual quality in modern art, and the possibility of a general re-birth of high imaginative power.

M. G. Van Rensselaer.

FRANK VINCENT DU MOND.

THE painter of "The Holy Family,"—the frontispiece of this number,—Mr. Frank Vincent Du Mond, was born in Rochester, New York, in the year 1864. His education in art has been in the main gained while earning a livelihood, he having spent some years in the designing-rooms of the "New York Daily Graphic" and Harper & Brothers. He was a student in the evening class of the Art Students' League of New York, and, later, out

of his savings he paid for a three years' course in Paris at the Académie Julian, under Le Febvre and Constant. During his first winter in Paris—in 1889—he sent a small landscape to the Salon, which was accepted, and in the following year the picture we have engraved. It was awarded a medal of the third class. He was also an exhibitor in the Salon of 1891. He returned to the United States in the spring of this year.

W. Lewis Fraser.

WULFY: A WAIF.

A CHRISTMAS SKETCH FROM LIFE.

TO THE EDITOR OF THE CENTURY. DEAR SIR:—You may possibly find this sketch of "Wulfy: a Waif" suitable to your pages. The sketch is a bare transcript of fact. No word or act is modified. It would have been easy, by a few changes, to produce a dramatic story out of the life of my small friend, but these changes I was unwilling to make. May not a simple record of fact have its place also, since such strange and lonely little souls as Wulfy's actually wander on our planet?

Sincerely yours,
The Author.

Y father 's a good father; he don't hardly ever hit me," wheezed Wulfy.

"No, but he scolds him awful," interposed Jakey.

They were standing around Miss Margaret's chair—three little waifs of the street. Jakey, the Italian, with Murillo curves to mouth and eyebrows; Fritz Hütter, somewhat taller, his soft hat worn on the back of his curly head, his face sickly and sweet-eyed; Wulfy, the shortest of the three, his large and rickety head with its wide mouth, giving him something the effect of a Japanese doll. All the boys were dirty and ragged, but Wulfy's rags carried off the palm. There was more hole than cloth. His face, overspread by a peculiar yellow grease, had a curious smile; at times it was a positive leer of worldly wisdom; again there crept into it something shy, appealing, and—could one venture to use the word—childlike. His eyes, when one could find them, were blue.

"He scolds him awful," said Jakey.

"Yes, but that's all right!" said Wulfy. "Yer see, he gives me two cents ter buy my breakfast, an' sometimes I 'm hungry an' I asks him for fi' cents, and then he does scold; but that 's 'cause he wants the fi' cents hisself, don't yer see?"

All this with an eagerly apologetic tone.

"How old are 'you, Wulfy?"

"I *think* I 'm ten, but I might as well be twenty-five. I 'll never be no bigger. I 'm goin' to be a little man, yer know, like the little man at the dime museum. I went to the dime museum once, an' I saw a man swaller two swords!" This speech, somewhat mournful and meditative at the beginning, became gleeful toward the end.

"And you live alone with your father?"

"No. I ain't got no mother, yer know. There 's a friend of my father's lives with us. I calls her aunty."

"And is n't she your aunty?"

"No. She ain't no relation. She 's jist a friend of my father's."

"O-oh," said Miss Margaret. Her knowledge of life was becoming enlarged. "And is this friend of your father's good to you?"

"She don't hurt me. An' my father 's a good father now. When I was littler I could n't dress myself 'cause my leg used to be so bad; he had to help me, an' course he did n't like that. Then it used to be hard. But I can dress myself now. He don't have to do nothin' for me. He 's a good father."

The other boys, attracted by picture-books, had wandered away. Wulfy still stood beside Miss Margaret. There was some lop-sided deformity about the tiny, stunted fellow. His weak hands pecked at her dress, and an indescribable guilelessness shone paradoxically through his world-weary little person. He talked in a guttural, gasping fashion, hard to follow; yet there was no accent, except that indefinable accent of the streets which becomes one's mother-tongue as one descends into the region of the Bowery.

"I had a mother once. A mother's a good thing to have. When I was little, an' my leg was bad, an' I could n't get dressed, I used to lie in bed and remember her; an' do yer know, sometimes I 'd feel so bad, I 'd feel as if I 'd like to die!"

All this with no touch of sentiment, but with the same matter-of-fact tone in which a few moments before he had been telling of his ambition to own a nanny-goat and peddle newspapers.

Miss Margaret, however, who had seen less of life's hard realities than Wulfy, was still inclined to be sentimental.

"You wanted to die so that you could be with your dear mother again, did n't you, Wulfy?"

Wulfy looked sideways, with a scared expression.

"No, no! She died in the horspital."

Miss Margaret waited, puzzled.

"They said they put her in a box and buried her. 'T was over on Long Island. I should n't be buried on Long Island."

"Oh, but Wulfy, don't you know? Your mother was n't buried, the real part of her; she went to heaven, and you can go there too when you die."

Wulfy was blank. Evidently no impression entered his mind.

Miss Margaret looked at the forlorn little

figure in silence an instant. Then all those lofty and etherealized conceptions of a future state which had been formed in the most advanced school of liberal theology slipped away from her, and she found herself saying:

"Wulfy, Jesus Christ, who is very good and who loves you dearly, died and went to a beautiful place called heaven on purpose that he might get ready a lovely house all for your mother and you. And when your mother died I think she went there, and I think she is waiting for you. Do you understand?"

Not at all. No more than if she had been talking Greek. With abrupt and disdainful transition, he announced:

"I won't die in the horspital."

The child quivered a little in speaking, like a frightened animal:

"They said they buried her, but they did n't, yer know."

"Why, what makes you think they did n't?"

The answer came reluctantly, in a hoarse whisper. Wulfy was evidently making a grand confidence.

"There was a sick man in a gutter. They took him to a horspital. They were *glad* to get him."

"Well?"

"He died. *They did n't bury him.*"

"Wulfy, what do you mean?"

"They take the poor, sick people, and when they die they—make—castor-oil—out of them."

Miss Margaret gasped.

"Who told you that wicked story?" she demanded.

"The man on the corner."

"Now I want to tell you something." She took his two wee hands and spoke impressively. "That is a wicked lie. Do you understand?"

Wulfy gazed at her blankly, then repeated his statement with serene and sorrowful assurance.

"They make castor-oil of them. He said so, the man on the corner."

Nor could any amount of persuasion, then or later, shake in Wulfy's soul the mystic authority of "the man on the corner."

"But I wish she had n't died," he went on drearily. "A mother 's a good thing to have. Better nor a father. A mother can make yer clothes. A father, he can buy yer clothes, but shoh! what's the good of that? Costs him fifty cents to buy yer a coat. What 's the good of spendin' all that money? A mother, she 'll make yer coat; yes, and wash yer clothes too. I wish my mother had n't died. Do yer know, my mother, she—used—ter—kiss me."

It was Miss Margaret's first experience of life in "the slums." Already she had begun to resent the opprobrium of the title; already

felt that the frank and sturdy humanity of her neighbors deserved a more respectful handling. She found character more interesting here than on Fifth Avenue, because less sedulously concealed; at the same time, she recognized as the chief evil of this existence its crushing monotony. There was less room than she expected for the exercise of that somewhat high-strung compassion with which she had left her home. She was at first inclined to lavish a double measure of such compassion on Wulfy, for the sickly little fellow limped the streets all the bitter winter, foraging for himself like the sparrows, with the aid of an occasional two cents from his father. When asked at any hour to describe his last meal the answer came cheerful and invariable, "Coffee and Ca-ake"; these, picked up at the street-booths, formed the staple of the child's diet. His little shivering body showed here and there through his rags. He suffered much pain at times, and, though silent for the most part about his home-life, it transpired slowly that he did not dare seek the mean shelter of his father's tenement till after nine at night. And yet, for all this, Miss Margaret soon found that in a sense her compassion was wasted. Wulfy was as happy as the day is long. He would suffer hardship with the unconscious patience of a kitten, and the prevailing mood of his sunny nature was delight at the queer pleasures of street-life. Wulfy had been to school once, and liked it; but having been absent, he was turned out, and his place given to another. No one was to blame. What would you have when thirty applicants are sometimes refused at these public schools in one day for lack of accommodation! Wulfy, under these conditions, could hardly expect to be educated by his country. He had also, at one time, peddled papers, but a member of the S. P. C. C., seeing his shaky little legs, put an end to this occupation from mistaken kindness. So Wulfy became an attendant imp in the street-life of lower New York. He knew by heart all the theater-posters on the Bowery; he haunted the Hebrew booths on Henry street in the evening, his small, ancient face watching like a child-Mephistopheles the evil that went on by the flare of the kerosene-torches. He joined in the rapture of barrel-bonfires, fleeing with all his small companions when the cry "Cheese it!" warned them that the "cops" were in sight. He was in the thick of every street-scandal, watching not only the row but the "flatteys"—a term which Margaret, highly amused, soon learned to know as the nickname bestowed on detectives by the hoodlums whose sharp eyes would pick out instantly, in spite of civilian garb, the flat-topped boot of the policeman.

There was nothing in the outer aspects of

city-life among the poor which Wulfy did not know. There was nothing apart from the limits of that life of which he had ever heard. Full of strange superstitions that had no grace of fancy or of perverted faith; a thorough little materialist, with no vocabulary and no consciousness outside of the life of the body; conversant with evil of which the woman who talked to him hardly knew the name,—Wulfy was yet innocent in heart as the Christ-child. Scraps of child-wonder and desire were interwoven with his wizened knowledge. Every impulse was generous, and his whole nature set to sweetness. He radiated affection; to hear him talk, no little fellow had ever been so favored with friends. Now it was the kind “butcher-lady” who had given him a dinner; now he had gotten an “o’er-coat”—poor, flimsy little o’er-coat, looking as if it had been chewed—“off” of his father, and beamed with filial devotion.

Like all ardent natures, he had one great passion. It was for his sister. Poor waif! His little husky voice poured forth one day the whole pitiful story, while one hand rested confidently on Miss Margaret’s knee:

“Do you know my sister Milly? She don’t live at home. She’s a bad girl, my sister Milly. She’s twelve years old, an’ you can be a bad girl when you’re twelve. Milly she come home late nights. Why, it was one, two, twelve o’clock an’ she did n’t come home! I’d sit up an’ open the door; father he’d go to bed. But he found out as she come home late, an’ he took her, and sent her off. The place where she lives, it’s a place where bad girls live. My sister Milly’s awful good to me.”

“And do you ever see Milly now?” asked Miss Margaret, crying in her heart over the child’s sorrowful knowledge.

Wulfy’s whole face brightened with an inward radiance that at times changed him from a Japanese doll to a child-angel.

“I’m goin’ to see Milly after Christmas. They’ve promised me I may. I ain’t a-goin’ to let ’em forgit it.”

“Are you glad Christmas is coming?”

“Yes,” with the bright impulse that always came first. “Ye-es—” more dubiously, and with a clouded face. “Santa Claus don’t come to my house, of course.”

“Why not, Wulfy?”

“He only comes to houses where there are mothers. There ain’t no mother at my house. He comes to Jakey’s house. Last year he brought Jakey a knife and a drum.”

“Do yer s’pose,” he went on eagerly, “as Santa Claus comes to the house where Milly is? There ain’t no mother there, yer know.”

A vision of the Reform School rose before Miss Margaret.

“I don’t know, Wulfy,” she said gently.

“But tell me: if Santa Claus should come to you this year, what would you like to have him bring?”

Wulfy brightened; for once, he looked like a genuine, jolly little boy.

“I’d like a drum, and an orange, and a pony with real hair on wheels, and—and—and a nanny-goat. Only a nanny-goat could n’t get into the stocking.”

“No,” assented Miss Margaret gravely. “Now, Wulfy, Santa Claus visits this house, I am quite sure, and, if you like, you can come here Christmas eve and hang up your stocking. Would you like that?”

Wulfy’s response was not made in words. Sticking out a spindly leg, he started with beaming face to strip off its grimy, wrinkled, and antique casing.

“Not now! Not now!” interposed Miss Margaret hastily. “Christmas eve! and, Wulfy, mind you wash the stocking before you bring it.”

Now Wulfy had aspirations after cleanliness. The first signal of his arrival was always a demand to “wash me hands”; and in a pan of hot water and a cake of soap he did delight. One day, when Miss Margaret had by vigorous scrubbing caused five pink finger-tips to emerge from thick grime, she had said, on didacticism intent, “I think clean fingers are prettier than dirty.”

“So do I,” assented Wulfy; “but if you had a bad leg, and had to climb six pairs of stairs every time you washed yer hands, I guess yer fingers would go dirty.” To which *argumentum ad hominem* Miss Margaret had instantly succumbed.

On Christmas eve arrived Wulfy, his face one wide smile. In his hand he bore a trophy:—“I washed it myself,” he announced with unspeakable pride.

“I should think so!” gasped Miss Margaret. It was a stocking. Rather it had been a stocking. Thick and slabby with dirt and grease, it had evidently been dipped in water, squeezed out weakly by tiny fingers, and allowed to stiffen, rough-dry. Miss Margaret took it, handkerchief at face.

Wulfy viewed the stocking in her hand, and a shade of anxiety began to gather in his eyes. Toe and heel looked as if large bites had been taken out of them.

“Can yer tell Santa Claus something?” croaked Wulfy.

“Yes.”

“Tell him, then,”—with a look of uncanny wisdom,—“to put the orange in the toe. It can’t fall through, yer know, and it’ll keep the other things in.”

“I will,” promised Miss Margaret. And with due solemnity the stocking was hung.

Christmas was not many hours old when

Wulfy came to welcome it. His face was clean in spots, to do honor to the occasion. Miss Margaret took him to the fireplace, his small body tense with expectation.

Santa Claus had remembered! He had remembered everything. There was even the orange in the toe; only, as the stocking was after all a very wee one, it had to be a mandarin. But there were the drum and the pony with real hair, warm stockings too, and mittens, and a muffler: yes, and a knife, and candy and raisins, and a large gold watch which would tick vigorously for over an hour when wound up.

If Miss Margaret had expected a demonstration, she was disappointed. Wulfy received his stocking in silence. The unpacking was an affair of time, for the little hands trembled so that they could not lift the packages nor untie the string, yet no one else was allowed to lay finger on the sacred treasures. At last it was accomplished, and the objects were ranged in a semicircle, Wulfy, cross-legged, like a Hindu idol, in the midst.

Then he broke silence.

"I got a gold watch!" he said, with a shaky sigh.

Nor could another word be extorted from him. This he repeated over and over, gazing at the gilt object as if hypnotized. Not his coveted pony, nor his ball, nor his drum, could hold his attention long. His eyes strayed back to the glittering watch, which he dangled speechless before each new-comer.

It was time for Wulfy to go home; and the journey was a function of state. In vain did Miss Margaret offer to help to carry the packages; he shook his head with determination. "Yer may go with me, though," he announced graciously. "I'd rather the boys." So Wulfy was laden like a small pack-horse, and started from the house, bundles under each arm and the full stocking slung over his shoulder. By Miss Margaret's side he hobbled joyful but exhausted. His feeble fingers dropped something every few steps, and not a raisin must be lost; his half-paralyzed side bent double under his burdens. As he jogged along, one boy after another of the street-urchins hailed him with surprise and glee, for Wulfy was known to them all.

"Hello, Wulfy!" "My eye, what a Christmas!" "Whatcher got?" met him on all sides. Wulfy's grotesque little figure staggered under its bulky bundles with the proud and serene air of an Eastern prince. Secure in the protection of Miss Margaret, he answered briefly but freely.

"I got a gold watch," was his response to every salutation. As they advanced, the walk became a triumphal procession. Boys sprang up from the paving-stones, poured from the alleys, dropped from the sky. In front marched Wulfy's special friends Jakey and Fritz, as a

guard of honor; behind and around was a crowd of boys of all sizes, hooting, curious and envious, and in the midst trudged Wulfy, laconic in his triumph, his stocking bobbing on his shoulder. The bright gold of the orange showed through the jagged toe. He was growing pale and breathless when at last the cavalcade halted at the entrance to a dilapidated court. He surveyed his followers an instant in silence, then, croaking a little louder than usual, he announced:

"Yer can go back now."

And the boys went.

Miss Margaret waited. She hoped for an invitation to Wulfy's home. But she received none.

"Good-by," said Wulfy with dignity.

Thus dismissed, Miss Margaret murmured meekly, "Good-by," and turned away. But another thought had struck him.

"Wait!" he called. "Where are yer going?"

"To church."

Church was one of the ideas and probably one of the words which lay outside of Wulfy's sphere; but perhaps he associated it dimly with beneficent powers, for he sidled a little nearer and wheezed with a touching sweetness of manner:

"Yer might tell Santa Claus as I liked all this stuff."

For some time after Christmas Wulfy, to use his own phrase, did not "come over." There was nothing surprising in this. He was irresponsible as a squirrel, and often would vanish, no one knew whither, for a month at a time. But at last, on a bitterly cold day, he reappeared. His rags were a little more sparse than usual, his face looked pinched, but he wore his familiar smile.

"Wulfy," said Miss Margaret, "where are your new mittens?"

"I gave 'em to Jakey. Poor Jakey did n't have any," he said, looking at his blue fingers.

"And why don't you wear your nice stockings?" for the little legs were incased in the old rags.

"Them stockings were n't no good."

"Why not?"

"Sho! they fitted tight! Stockings ought ter wrinkle. Like these. Then they keep yer legs warm. See?"

Miss Margaret saw: Wulfy's wisdom was, as usual, convincing.

"I've seen Milly," he announced.

"I'm glad. Was Milly pleased to see you?"

"Yes. She kissed me," he said with shy pleasure. "They're good to her. She has pud-denst twice a week. I gave Milly my gold watch."

"Why, Wulfy! I thought you liked your gold watch."

"Like it! Guess I did. 'T ain't every feller as has a gold watch. Milly liked it too."

Every shred of his Christmas gifts had vanished. To trace them was impossible. The pony, it seemed, and the candy had also gone to Milly. The knife, the ball, and all the rest had doubtless been distributed among the members of the youthful procession which had followed Wulfy through the street in his hour of triumph. He had not kept a peanut for himself.

"Wulfy," said Miss Margaret soberly one day, willing to try him, "oh, Wulfy, where are your Christmas things? Are n't you sorry they are all gone?"

Wulfy looked sober too for a minute, and his worldly-wise little lip quivered childishly. Then a smile broke over his face, he gave a brief chuckle, as was his wont when pleased, and then croaked jubilantly: "I had 'em once."

Happy Wulfy! In this short sentence he had found a philosophy of life.

And Milly? Did Milly, who was a "bad girl" who had known a wild and secret life, did Milly care for a 'tin gold watch, for candy, and for a pony on wheels? Did she take them to please the little brother whose clinging loyalty may have been the one tie that held her to good? Or did the child perhaps still live in Milly,—poor Milly, who, although she was bad, was only twelve years old, after all,—and did she like the pony and watch for their own sake, with a little girl's affection? Who shall say!

Wulfy, at least, was happy. Santa Claus had given him the two greatest pleasures in life: the pleasure of possession and the pleasure of sacrifice.

MISS MARGARET went home soon after this: it was a year before she returned to lower New York. The day after her arrival Wulfy "came over." He looked plumper, his face was clean,

and his clothes were neatly patched. Altogether he was a far less uncanny object than of old.

"Good mornin'," said Wulfy, "I 've got a new mother. She ain't a friend of my father's. She 's a new mother—a real one. She cooks my meals. Look here,"—holding out a fine patch,— "she did that. Look at them pants. I got 'em off my father. She told him to buy 'em for me. Once I did n't go home, and she thought I was lost, and, do yer know, she cried till she was black and blue. She was sorry."

With this wondrous climax he paused, breathless and rapturous. So Wulfy was to know the joy of being missed, of being shielded! He was no longer to depend on the chance kindness of the butcher-lady or the grudging two cents of his father to feed his small body; no longer would he laboriously scrape together stray pennies to buy for himself the shirts that barely covered his thin little chest. The waif of the streets was to be a waif no more. He was to know, though in a rough and poor fashion, something of the kindness of a home. Already the child-face, that of old showed only in rare moments, had become habitual to him; and the wicked and antique wisdom which had overspread it as a mask came back only in flashes now and then. The stunted body and sunny soul might know a little comfort at last. Life was sweet to Wulfy now.

Yet not all sweet. Still there was sorrow; still, disappointment, and desire unfulfilled. For Milly was not at home.

"I goes to see her," said Wulfy. "But I don't tell her about the new mother. I tell her its jist another friend of my father; for if she knew it was a new mother, Milly 'd want ter come home. An' they say she can't come home—yet."

Vida D. Scudder.

AN OFFERTORY.

OH, the beauty of the Christ-child,
The gentleness, the grace,
The smiling, loving tenderness,
The infantile embrace!
All babyhood he holdeth,
All motherhood enfoldeth,—
Yet who hath seen his face?

Oh, the nearness of the Christ-child,
When, for a sacred space,
He nestles in our very homes,—
Light of the human race!
We know him and we love him,
No man to us need prove him,—
Yet who hath seen his face?

Mary Mapes Dodge.

MADONNA. BY DAGNAN-BOUVERET.

THE SONG OF THE BROOK.

(TO LÉONIE CINQ-MARS.)

OH, listen! hush!
As lightening down its path among the grasses,
'Neath brier and spreading bush
Hidden, and fleet
On silvery feet,
The swift brook passes.

Unseen, but heard—
Heard with rapt heart, and brain, and eyes that listen;
Oh, the clear, wild refrain;
The sighs; the rippled laughter;
The songs which have no word
That poet's happiest rime can follow after
Nor truest harp intone;
The low, sweet, stammering talk against the pebbles
That wait to catch
And break its deeper sound in quivering trebles;
The silence, sudden, strange, that seems to snatch
All this glad music to its deep, still heart,
Just for a breath, apart!

Oh, listen! hark!
The woodland voices here imprisoned, blended;
The sway of leaves; the singing tone and splendid
Of mounting lark;
The timid, coaxing chirp that warns the nestling;
The cleft branch, crashing through the startled air;
The ceaseless stir and soft, mysterious rustling
Of hidden insect life
In bark and twig, in moss and crevice moving,
A voiceless world of toil, perchance, and strife,
Perchance of joy and hope, and happy loving.
Hark! the ripe, dropping nuts; the squirrel's chattering calls,
And sounds of dancing feet, as fauns were keeping
Time to the music of its liquid falls
That ever oceanward go leaping, sweeping
Over low, mossy walls,
Down rocky ledges,
Past swirling vines and through the bending sedges.

Strange that the woodland's song, and spelt-out story,
So full and clear,
So whole and rounded to the poet's ear,
Should lose its deep significance and be
Only a breath, a tone—
One of the many murmurs of the sea!

And so, my brook, good-by!
Dumb distance takes thy song, with echo blending
Ripple by ripple, sigh by lingering sigh,
And tear by tear—at last, in silence, ending.
And there is left to me
Only the memory
That fills my soul, still, with thy melody.

CHARACTERISTICS.

BY S. WEIR MITCHELL, M. D., AUTHOR OF "IN WAR TIME," ETC.

I.

HIS book is a broken record of portions of the lives of certain friends of mine, and of what I, Owen North, physician, have seen and heard. My people, who were of the Society of Friends, came from Wales, and were with Penn

in the *Welcome*, but had lapsed from grace and followed the religious guidance of Hicks. I was further emancipated by the study of medicine, which I took to because it interested me and not of necessity, since at the age of twenty-one I was a man of ample means, free to do as I liked. After a year of hospital work, and three years of added study in Europe, I came home to settle in my native city.

Whatever value this irregular account of myself and my friends may have is due to the care with which I have watched the developmental growth of character. I like, therefore, to say at the outset what I appear to myself to have been — leaving the reader who likes to follow me to learn for himself what life did to foster the good or ill that was mine by nature. In early manhood I was shy, reserved, and self-conscious. Always ambitious, and disliking failure, my youth did not supply me with such other competence of motives as to urge me to success in consecutive study. What I liked to do I did fairly well. When older I found that the power to do best what I enjoyed doing led at last to the easier doing of whatever I wished to do. I cannot remember that as a boy any intellectual work had for me the smallest attraction. In those days it was thought in my native city not quite reputable to have no distinct occupation in life, and under this influence I began to study medicine. As I became increasingly interested in the studies of the profession I had chosen, I was curiously surprised to find that the capacity to concentrate my thoughts, which I never had in youth, rapidly grew; in fact I developed later than most men. About the time I began to like scientific study I lost for life the sense of ennui which had been one of the peculiarities of my childhood, and too, with success, became quietly sure of myself and more and more capable of sustained effort. Finally my long absence abroad enabled me usefully to escape from many of the narrowing associations of my youth, and to enter

on life untrammelled. I found, indeed, as I grew older, that the comrades of my youth were no longer such. I had moved away from them; but friendly time brought others whom I learned to love better and with more reason. It is only needful to add that I succeeded in my profession, and at the outbreak of the great civil war was in an enviable position, having a practice far beyond what would have been possible in Europe at my time of life.

The call of war stirred me in many ways. My people had been Friends from the day of their landing in America, but I myself had ceased to be, like them, troubled with scruples as to war. I only hesitated as to how best I could serve my country. That in some way I must do this was clear to me. As to slavery I had been little disturbed; it was a gangrene sure in time to die of its own accursedness. But the thought of a dismembered land, and, above all, the final insult of Sumter, settled for me, as it did for thousands, what I ought to do.

I soon saw that as a surgeon I could be of most use. I was, as the world goes, rich, and had no need to consider the future. Accordingly I gave up all my appointments, and entered the service as an assistant surgeon in the regular army. Of this life I mean to say little.

I could wish that some one would fitly record the immense services of my profession during the great war, but this is not the place to do so; and I content myself with the merely personal statement that I was almost incessantly occupied with field duty. This open-air life gave me the physical vigor I somewhat lacked; and this I saw occur in many others. Despite the cripples made by war, and those who came out of it diseased, I am disposed to think that the survivors returned to civil life with, on the whole, a larger capital of available health than the like number would have possessed had there been no contest. I was soon to learn in person how valuable was this toughening process.

We were lying before Petersburg, very weary of the siege, with its many failures. An attack at dawn on the left flank of Lee's extending lines necessitated the usual ambulance service, and for this I was detailed. The effort on our part failed, and the return attack cut off for a time my ambulance party and a number of wounded. We were in a rather dense wood, and remained unperceived until toward evening; nor was it prudent to attempt escape. The firing had been distant and irregular most

of the day, and near dark, hearing the groans of wounded men somewhat nearer to the edge of the wood, I took a sergeant and two men, and went in search of them. There were many dead, and, lying among them, three more or less badly hurt; one of these needed immediate amputation of an arm, and we set about this at once. Meanwhile a sharp firing broke out on the right; the balls began to fly over us so that the twigs fell about us from the trees. Rarely does a man have to operate under fire. This time it fell upon me to do so, and as I began my assistant suddenly cried out, "It is no use, doctor." A sharp convulsion shook the body of the wounded man, and, looking up, I saw that a bullet had gone through his head. A moment later I felt a blow on the back of my neck, and lost consciousness.

I cannot say how long I remained insensible. By degrees I began to see the trees, the moon, and the swift hurry of clouds across its brightness. I faintly remember that at first I connected their quick motion with retreat and failure, and was hurt with the shame of it. Then again I lost it all, and for a time—how long I do not know—rose to brief spells of dream-haunted consciousness. The sadness of dawn was in the sky before I was fully myself. I heard the moan of wounded men, and knew that it was my duty to take care of them. I tried to rise, and could not; my arms and legs were alike motionless. I made an immense effort, and knew that it was in vain. I was also paralyzed as to sensation, and could not feel that I touched the ground. But about my neck I felt the blood dried stiff in my collar. I must, however, have been still bleeding freely, for again I lost myself while divided between wonder and horror at my state.

At about sunrise I was awakened by familiar voices, and presently was rolled over and inspected by a hospital steward and one of my brother surgeons, to whom were soon added two line officers. I could not speak, but could hear more and more easily as they lifted me to a stretcher and made my obituary in a few brief and not altogether eulogistic phrases, with a final remark by a captain that "He treated me at Cold Harbor and got me a long sick-leave, and gave durned little medicine, too."

One man remarked, "Good fellow, but a dreamy sort of a cuss." And thus, having died for my country, and heard its opinion of me in little, I came to myself. As my bearers trudged along I had first a misty recognition of the fun of it, then curiosity as to where I was hit, but at length pain in my neck from the to-and-fro roll of the stretcher as my bearers, keeping step from habit, moved toward camp.

At last I was able to say, "Break step. I'm not dead."

"By George! The doctor's alive!" exclaimed one of my aids, and so, after this excursion out of my wits, I got into a good tent and, after a more thorough examination, was sent home to die.

A bullet had passed through the muscles at the back of my neck and paralyzed the spinal column without directly wounding it. For several months I lay quite powerless, all that there was of me within control of my will being the head and its contents. I could not stir arm or leg; I even spoke with difficulty; and would awake gasping for breath at night, because my will was more or less needed to keep my chest in motion.

I was for weeks, as I well knew, on the margin of another world, and absolutely clear in mind to consider the peril. I had no wish to die, despite my horrible state, for I had no pain, and it is pain which makes the ill man indifferent to living. Neither did the nearness of death alarm me. I remember that I concluded that the naturalness of death must be strongly set in our instinctive being, because, although I have seen many wounded or ill men die slowly without suffering, and fully possessed of reason, obvious fear of death, when death is near, scarcely exists, and most men, under these conditions, seem to await their fate with calmness. In fact, I can recall only one case where a man, conscious of death at hand, showed intensity of fear.

I lay at rest, if rest it can be called, in my own rooms, and had all that means could give me. Friends I had too, for I have a talent for friendship, and these came and sat with me or read to me. I remember, however, that some who were very dear to me in health did not seem to fit into my new conditions of life, and that in my helplessness the women whom I was able to see were always the more acceptable visitors. I suspect that at this time I must have been very sensitive. Certain persons depressed me; I could not easily say why others soothed. Now and then came some one who made me feel as though I had taken a strong tonic.

This priceless gift nature has given only to a few. It cannot be acquired; no imitation of it succeeds; nor is its quality easy of analysis. It is not manner, neither is it dependent on a sanguine temperament, as one might fancy. Nor is it a part of such mere unthinking manners as make some men always willing to predict success. One comes here to the question of professional manners, a delicate matter of which I thought a good deal as I became a more and more sensitive human instrument. There is no place where good breed-

ing has so sweet a chance as at the bedside. There are many substitutes, but the sick man is a shrewd detective, and soon or late gets at the true man inside of the doctor.

I know, alas! of men who possess cheap manufactured manners adapted, as they believe, to the wants of "the sick-room"—a term I loathe. According to the man and his temperament do these manners vary, and represent sympathetic cheerfulness or sympathetic gloom. They have, I know, their successes and their commercial value, and may be of such skilful make as to deceive for a time even clever women, which is saying a great deal for the manufacturer. Then comes the rarer man who is naturally tender in his contact with the sick, and who is by good fortune full of educated tact. He has the dramatic quality of instinctive sympathy, and, above all, knows how to control it. If he has directness of character too, although he may make mistakes (as who does not?), he will be, on the whole, the best adviser for the sick, and the completeness of his values will depend upon mental qualities which he may or may not possess in large amount.

But over and above all this there is, as I have urged, some mystery in the way in which certain men refresh the patient with their presence. I fancy that every doctor who has this power—and sooner or later he is sure to know that he has it—also learns that there are days when he has it not. It is in part a question of his own physical state; at times the virtue has gone out of him.

The gift is not confined to men. One middle-aged woman had it for me when I lay helpless in my palsied state. She was a person so simple, so direct, so easily sure to do and so certain to abide by the right thing, that to unthinking people she may have appeared to be commonplace. An angelic form of good sense dominated by tenderness underlay the positiveness of her character and was a part of her nature. Moreover, she possessed also sense of humor, that gentlest helpmate in life. I do not mean that she was creatively humorous; she was only appreciatively and apprehensively humorous.

I had a rather grim but most able surgeon. He seemed to me to have a death-certificate ready in his pocket. He came, asked questions, examined me as if I were a machine, and was too absorbed in the *physical me* to think about that *other me* whose tentacula he knocked about without mercy, or without knowledge that tenderness was needed. Our consultant was a physician with acquired manners. He always agreed with what I said, and was what I call aggressively gentle; so that he seemed to me to be ever saying with calm self-approval, "See how gentle I am." I am told that with

women he was delightfully positive, and I think this may have been true, but he was incapable of being firm with the obstinate. His formulas distressed me, and were many. He was apt to say, as he entered my room, "Well, and how are we to-day?" And this I hated, because I once knew a sallow undertaker who, in the same fashion, used to associate himself with the corpse, and comfort the living with the phrase, "We are looking quite natural to-day."

My soft-mannered and mellifluous doctor who thought well of himself was nevertheless a most intelligent physician; but some people possess no mirror for social conduct, and the court fool, who tells men the truth, is out of fashion. He went along in life not knowing how absurd he was at times. To have known would have lessened his usefulness. Self-ignorance is sometimes an essential condition of utility.

My good little woman friend supplied me with what my doctors did not, and to this day I cannot tell how she did it. Despite, however, her too rare visits, and those of others who were less helpful, I had a horrible amount of time on my hands. Much reading wearied me, and so I lay imprisoned within the limits of my memories, or took a curious interest in the minutiae of the little life or action I could see in my room or through my windows. I watched for long months the leaves come and flourish and depart from a tree (a horse-chestnut across the street), and saw its varnished buds unfold to queer insect shapes and then spread out into green tents. The spider which spun on my window-pane I would not allow to be disturbed, and even the flies were sources of interest. Far away were two weathercocks; one was too motionlessly conservative to stir with the breeze, but now and then, when the wind was east, it was correct. It seemed to me like the man with one unchanging opinion, and with whom the world comes some day to agree. The other cock was an honest, mutable fellow, and warned me that a norther was on the way to torment me, as it always did, with a horrible sense of futile restlessness. I used to lie and wonder whether the cock was chosen for a sign of changeful winds because it was a reminder to the unstable Peter. But these trifles are of the intimate life of chronic sickness, and perhaps are of little interest to the thoughtless who are well.

The man thus imprisoned within himself recovers by effort a vast amount of memorial property presumed to have been lost. If I shut my eyes and lay still, as, indeed, I had to do, and then seized firmly on some remembrance of verse or prose or events, by degrees it seemed to aggregate other memories long forgotten. It was like a process of crystallization—to stir up the fluid is apt to disturb the formative action.

If I stopped to think, compare, and conclude, I found that I interfered with the process of accumulative recollection. My favorite amusement was to recall men I had known, and to construct for them in my mind characters out of what I had seen or heard of them under the varying conditions of camp, battle, or wounds. This would lead me to anticipate what their future lives would be and how in certain crises of existence they might act. I did this also for myself over and over, until it seemed to me that I could be sure of my precise conduct under any and almost every variety of circumstances. Some of the insights I thus won by these excursions into the puzzle-land of character used to startle me at times, because it seemed as though the concentration and intensity of attention imposed upon me by my state enabled me, from the memory of a single interview or incident, to work out easily the whole characteristics of a man. This power did not continue in as full force when my conditions of life were altered. What it left with me was an unusual fondness for the study of men and women, and this I take to be a rare taste, because although people make guesses at character, and novelists and dramatists are presumed to study it for a purpose, and some men of affairs have an almost instinctive appreciation of what a man in contact with a given matter will do, the tendency to study character for its own sake from a naturalist's point of view is most uncommon. In fact, too, the business-man's working knowledge of character and the writer's are distinct, says George Eliot; the former cannot put in words what he uses any more than the latter can use in the give and take of life what he can so well put on paper.

I look back with surprise at the months I passed as a crippled man, my head alone alive. My cheerfulness was due to temperament, and also to what I may call the temperament of my disease, for people who have spinal lesions without pain are apt to be more calm and un-irritable than those who have certain visceral disorders. Consumptives are said to be hopeful, but the sick liver predicts damnation. A learned divine said a thing of extraordinary wisdom when he announced that no man, however secure he may be in mind as to his future life, ever dies a triumphant death with disease below the diaphragm.

On the 8th of May, 1866, I observed that I could wiggle the second toe of my left foot. I have ever since had a peculiar affection for this little sub-member of my locomotive organs. Head and toe were now both alive, and seemed to salute each other across a length of motionless body. I indicated this immense fact to my affable doctor. He put on his glasses and looked. Then he said, "You will get well."

To which I replied, "I always was sure of that."

I saw that it was disagreeable to him to be thus anticipated by hope, and so said no more. In the evening he brought the consulting surgeon, and triumphantly pointed out the prophetic conduct of this hitherto uninteresting part of me.

I am not concerned to dwell upon the medical details of my case except as they bear upon life or character. Sensation came back first, and in about a month I could move both legs and arms; but I had become the victim of a new experience. As my locomotive powers increased I suffered agonizing pain in the back and neck and arms. It was almost my first enduring personal sensation of acute pain, and it lasted long enough to enable me to make acquaintance with every variety of torment. Civilized mankind has of will ceased to torture, but in our process of being civilized we have won, I suspect, intensified capacity to suffer. The savage does not feel pain as we do; nor, as we examine the descending scale of life, do animals seem to have the acuteness of pain-sense to which we have arrived, a fact I have often observed in regard to wounded horses on the battle-field. I had at one time served awhile as assistant surgeon in the wards of a hospital to which were sent most of the bad cases of wounded nerves. In this abode of torment, where sixty thousand hypodermatic injections of morphia were given and needed within a year, I saw every form of suffering. But personal acquaintance with pain is quite another matter. It inclines me to think that every doctor ought to go through a sharp little course of colic, gout, and, if you please, a smart fit of hysterics before venturing on the practice of his profession. An old friend of mine used to say that all clergymen should have a mild education in iniquity as a preparation for their career, but this I hardly hold to as a serious opinion.

Assuredly I had never realized the influential qualities of pain as I now came to do. Of all the means not of his own making which degrade, debase, and morally ruin a man, pain seems to be the most potent. I became irritable, perverse, ungrateful, and selfish. I lay abed thinking how I could put my tortures into language descriptive enough to impress the infernal calm of that placid doctor, who came and went, and was as cool as I had been in the wards of that museum of anguish to which I have above referred. I had been wont to think and speak philosophically of pain, but this continual and ingeniously varied torture was to me a novel experience, and left on my mind the belief that certainly an abode of eternal torment would have the effect of making men hopelessly regret lost opportunities, but would

as surely make them morally worse, if it left them leisure to think at all.

I steadily resisted all efforts to induce me to use sedatives until one day, toward evening, when I had a new performance in my hands, as if they were being rasped with hot files. Then I yielded, and my doctor gave me a hypodermatic injection of morphia. I lay awake all night in perfect comfort, heedless of the passage of time, and wondering at the bliss of relief. 'T was heaven bought with hell, for the next day I was doubly tormented.

None who have not known long chronic illness can conceive of the misery enforced idleness inflicts on a man used to active life. This intensity of ennui, comparable only to that which some children suffer, is eased by morphia. The hours go by almost joyously. Misfortunes trouble no longer. One drifts on an enchanted sea. This death of ennui is the most efficient bribe which opium offers.

I dreamed a great deal during my long sickness, and not always unpleasantly. At one time, in my younger life, I read that Lord Coke kept a diary of his dreams, in the belief that from them he could learn more of his true character. Before I took morphia I followed his example for a time, dictating my dreams to my nurse; but I soon tired of this, as I observed that often in dreaming I could, as it were, examine my own mental state, and always to the effect of concluding that what I did, said, or thought was as I would have done under the like circumstances when awake, except that I rarely seemed to myself to laugh in dreams, whereas, when awake, life was full of humorous aspects to me. Under morphia I was capable of mirthful visions, which occurred to me while I was awake at night. Dreams are very personal things, and this may be why my father always insisted to me when a child that it was bad manners to relate dreams, and certainly nothing interests one less than to be told the dreams of another man. I had, however, two experiences in this matter which are so amusing and curious that I venture to relate them as additions to the rather grim literature of opium.

I had taken one night a grain of morphia, and then another like dose, and thereupon passed into a sweet sleep. In an hour I awoke and began to see things, chiefly scenes from the "Arabian Nights," and then, abruptly, the following:

I had been for some years, as I have said, in practice in a great city, and now I saw my little study with all its belongings set out clearly in the darkness of my chamber. A maid servant entered and told me that a patient wished to see me. I said, or seemed to say, "Ask him to walk in." Upon which the

woman opened both leaves of the folding-door between me and my waiting-room. This excited my wonder until I saw enter with difficulty a man of enormous bulk. He looked at the chairs, and finally sat down with care on a lounge, remarking:

"At hotels I have to be careful; they put it in the bill."

The vision went on, and I apparently said, "What can I do for you?"

"As a gentleman," he returned, "I cannot go further without a warning. I want to consult you, but I cannot in justice do so until I say that whenever I mention a symptom to a doctor it leaves me and goes to him."

"Really!" I exclaimed, incredulously.

"Yes. They all tell me that I am a crank; that this is a peculiar delusion, and the like."

"Go on," I said. "It is easily tested."

As I replied I noticed that his eyes were singular, the iris and pupil being quite double the ordinary diameters. The color was a dead gray, and the organs in question had a malicious fixity of expression.

"Pray go on," I repeated. "Are you in earnest?"

"I have a severe pain in my back, about the lumbar region on the left."

Instantly I myself felt a sharp pain just in the part mentioned, and I put my hand to it, or seemed to, for the arms were still unable to move freely.

"Aha! I was right; you doctors are all skeptical."

"Nonsense," I returned. "This is not strange enough to convince a reasoning man."

"The last fellow said it was a coincidence."

"Go on."

"Oh, very well. I am blind in my left eye."

At once I covered my right eye, and knew that he was right. I was unable to see anything.

"That will do," said I, faintly. "Stop."

"Yes. You cannot say that I did not warn you. It may interest you to know that as I came up the street I left eleven symptoms with different doctors. One was difficult to satisfy; he got an enlarged liver, emphysema of the left lung, and varicose veins. I have seen but one reasonable doctor, and it, or she (for the doctor was a woman), said she always carried away some of her patients' symptoms, and would have nothing to do with me."

At this he rose, and I also attempted to do the same, but found that my armchair rose with me.

"What horrible thing is this?" I said.

"I forgot!" he exclaimed. "How shall I ever forgive myself! Now it is too late. I ought to have told you that as my aches and ailments leave me to settle in the body of the doctor, so also does my flesh, which, as you see, is un-

duly great. A few days more and I shall have left the rest of my excess in Boston. There no one believes anything old, and everybody believes anything new."

"Please to go away," I said; and I saw him waddle slowly out of the room.

The notes of this queer vision I managed to make my nurse write for me the next morning. Its oddness to me consisted in the fact that it amused me as it passed before me, and that I appeared to be at the time watching myself, as if I, the watcher, were one, and I, the actor, another person—not a very rare state in ordinary dreams.

These opium visions were of a definiteness which is never found in the dreams of sleep, and they were rarely unpleasant. I could not command their presence. For many nights I would sleep well under morphia, and then pass a night of entire wakefulness haunted by spectacular scenes. I promised to limit myself to the telling of only two; both had some relation to things in which I had been especially interested. Thus I had once experimented with care on myself to learn how most safely to reduce an excess of fat; and my second vision was in some way the outcome of a paper I wrote as a student.

I was of a sudden in the laboratory of the foremost of American chemists, and had arranged an apparatus so that on one side of a piece of tanned rhinoceros-hide I placed bisulphid of carbon, and on the other an agent well known to my dream state, but, alas! lost to the memory of daylight. My chemical friend smiled blandly as I told him that osmotic currents would slowly form in the course of months, and, my bisulphid of carbon being very gradually decomposed, crystals of carbon, or, in other words, diamonds, would be formed on the surface of the membrane. Having arranged my apparatus, it was put into a safe. I remember to have felt the most profound interest, not unmixed with amusement, at what I did, and I was annoyed when the laboratory faded away and a Druidical procession appeared in a grove. At last I had a distinct sense of gratification as again the laboratory appeared, and my friend stood before the open safe. I carefully drew out the tray on which stood the dialyzer. On the top of the membrane were several dull-looking stones, one as large as a walnut. My friend took this up, and crossed the room. In a minute he came back, saying: "You have made seven hundred thousand dollars' worth of diamonds. This lesser one is of perfect water; the large one is a little blue."

I said that I knew I should succeed.

"It will be very useful in the arts," returned my friend. "I shall like to have about two dozen of the size of a pigeon's egg to enable me to make certain studies in chemical physics."

Now this was pretty much what the man would have desired, and would have asked under like circumstances. The scientific aspect of the matter would for him have been the only one, and it did seem to me odd that, without act of will of which I was cognizant, he should thus speak through me with the simplicity and directness which are a part of his character. Again, it was characteristic of me that some of the moral developments of the affair should present themselves. However, without more comment, I will relate my further remembrance of it as it was written down next day.

I answered his desire by a promise that he should have what he wanted, and went on to say: "What shall we do? I may make ten millions in diamonds, and then cease, and never reveal the method; or I may at once publish it, in which case all the diamonds in the world become as glass, and multitudes of people are ruined. And what will the women say?"

"Some one must continue to make diamonds," said my friend. "There are numberless uses for them which their cost now forbids."

But I could not consent to make a fortune, sell my diamonds, and then render them valueless to those to whom I had sold them.

"It is a difficult problem," said he.

"It is an impossible one," said I; and here the vision ended in some wild cavern scene, for neither will nor wish on my part had power to detain a picture, nor to secure the continuance of one of these dramatic visions where I was the whole company and the whole audience.

II.

I WAS a year in bed before I could walk, or even stand, but my recovery was then rapid and complete. Pain I knew by this time in a wonderful variety of forms, but of whatever it finally did of good or evil to me I shall say but little. The evil was immediate, the good remote or indirect. If any man wants to learn sympathetic charity, let him keep pain subdued for six months by morphia, and then make the experiment of giving up the drug. By this time he will have become irritable, nervous, and cowardly. The nerves, muffled, so to speak, by narcotics, will have grown to be not less sensitive, but acutely, abnormally capable of feeling pain, and of feeling as pain a multitude of things not usually competent to cause it. I did what I have known one other human being to do, and that a woman. After several efforts to get rid of my foe by degrees, I shut myself up in my room, and, declining to see any physician, fought it out alone and unaided. At the close of two weeks I could sleep without morphia, but of the torture of that fortnight I have even now scarce courage to

think. The victory left me, as to my body, a wreck, but made me forever tender to those who are under the despotic rule of this and other as hurtful habits. I learned also how much of character is a question of health, and this too has had for me its value in life.

At the close of two years I was well and as vigorous as ever, but the wound and its consequence left with me one other result for which I was not prepared. I took a growing dislike to the profession of which I had been proud, having looked forward to being enabled to apply myself wholly to the study of the science of medicine rather than to its general practice. I suppose that I could have conquered my feelings, and that in time they would have left me; but I had no need to make a fight, and as yet my power of self-government was not what it had been. I disliked most of all the idea of practising among disorders like my own. This I cannot understand, but I may say that patients who have grave chronic maladies which they know to be fatal are, as a rule, indisposed to hear of the sad needs of like cases among the poor; nor, if rich, do they especially incline to help these, or to provide for them in any way. I am, as I have said, a student of character, but this peculiarity has never been quite explicable to me, and that it has had noble exceptions only serves to emphasize the existence of the mass of facts which prove my point. I saw pretty soon that I was in no condition to make a struggle, and so gave it up for a time, and went abroad.

While in Europe I amused myself with a close study of the characteristics of the Slav, the Teutonic, and the Celtic races, and for this purpose lived much among all classes. Some of my conclusions are to be found in my volume on the "Influence of Language on Character," which is, of course, but a part of a larger subject. I am not wholly satisfied as yet with my method of treating this matter, but I am quite certain that if to-day France and Germany were suddenly and miraculously to interchange tongues, the two nations would shortly undergo some unlooked-for alterations. I have known several people whose superficial characteristics were quite different according as they spoke French or English, although they were as fluent in the one as in the other. I know of one woman who is common and ill-bred as an Englishwoman, but who, when she speaks French, which she knows well, is apparently well-mannered and rather attractive. Nor, as we reflect, does this seem altogether strange when we consider how much national character has to do with the evolution of language and how impossible exact translation is. I have heard a man say that to read or speak French made him feel gay, and that the effect of like uses of German was quieting.

The second part of my work on national characteristics was to have been on the relative conception and valuation of truth, and then of courage, among nations. I was interrupted in the study by a call home on a matter of business which involved a large amount of money and allowed of no delay.

On my return I found that a certain Western capitalist, a man already of vast fortune obtained by modern methods, had succeeded in depressing what are fantastically termed securities connected with a short railroad, and that a good deal of my means was likely to disappear in the process of adding a million or more to the hoards of a great gambler.

What was worse, my father, who had had charge of many trusts, had confidently invested certain excesses of income for the widow of a friend in the securities in question, and for years their rise in value had justified him. But now came a robber who, by a variety of methods, succeeded in injuring the road with the intention of buying it in at a low rate as a bankrupt concern. In the case just mentioned a sick woman and two children relied largely on the income hitherto coming to them with regularity, and I felt that, as regards these victims, I must make good their losses. I was told by business men that this was absurd; that my father had acted in good faith and within the law; that it was no one's fault that their sources of income had failed these people.

It became more and more clear to me on my way home that I was to be a serious loser, and I went at once to consult a friend of whom I shall have, by and by, more to say. When I entered his office, Frederick Vincent was talking with Clayborne, another friend of both of us, and whom I had not met since my recent return. Clayborne looked like a giant out of business. A tall, stalwart man, clumsily strong, he stooped a little, and carried off but ill his unusual stature. To shake hands with this huge creature was a serious matter. He was innocently given to crushing the hand one confided to his grip in a fashion which not insignificantly reminded one of the way in which he was apt to deal with the emotions or prejudices even of those he loved the best.

"I have been to see you both," I said, "and did see Mrs. Vincent."

It was pleasant to feel sure how glad these men were to welcome me. As I explained the reason for my sudden return Vincent's face took on that look of grave intensity of attention which so inspired confidence in his advice. The large ruggedness of Clayborne's features underwent no change, but he, too, set himself to listen, and now and then made a note.

"Well," I said, after fully stating the situation, "it is my good fortune to have found you together. I come prepared to take whatever

counsel you may give. Does the law offer me any chance, Vincent?"

"You might as well go to law with a cyclone," growled Clayborne.

"No," said Vincent; "I think we might beat him in time; but it would be costly, might take two years or more, and, frankly, my dear Owen, I do not think you could stand it. Commercial men have no idea what a torture business—complicated business—may become to—"

"To one like me, Fred? You are right, quite right, I could not stand it."

"I would not go to law," continued Vincent, "and I see no other way out, except to sell and accept the loss."

"Transfer your interest to me," said Clayborne, "and let me fight it for you; I shall enjoy the row. It won't hurt me."

"No; I cannot do that."

"And what else will you do?"

"I must go West, and look into the state of the road. If it seem hopeless, I shall sell out and make good the losses of the woman I spoke of."

"Nonsense!" exclaimed Clayborne.

Vincent said nothing.

"Do tell the boy not to make an ass of himself," said Clayborne, who was, I should have said, by many years our senior.

Vincent smiled. "In a year or two, you, under like circumstances, would do the same as Owen. Your moral mill grinds slowly, my friend, but I have observed that it is pretty sure at last."

"But no man's conscience—not the most scrupulous—"

"Pardon me, Clayborne," interrupted Vincent; "it is not a case of conscience or of honesty."

"And of what then?"

"Men used to call it honor," said Vincent, gently, without reproach or cynicism in his manner.

"Confound it!" said Clayborne, slowly rising. "The note is above my moral gamut. I am like the people who cannot hear the squeak of a mouse."

"Nevertheless, Owen is right."

After this I went away to my hotel, reflecting as I walked along on the possible character of my robber. Here was a man with overmuch who wanted more. Was this avarice, or was it due to the pleasure he found in a game played without scruple? A famous burglar once told me that it was largely the excitement and the immense obstacles in the way which made him a plunderer of safes. Perhaps my foe had a certain joy in the complexity of the game of destruction; yet it must have been also that he loved mere money, because no one ever heard of his having suddenly restored a road to its ruined owners, as one sets up tenpins it has been a pleasure successfully to bowl over.

Had he never been threatened? Did he fear no wild justice, the outcome of the agony or madness of some one who saw wife and children beggared and himself too old or too ill to renew the fierce battle of life? My robber financier must have the courage of his guilt or lack predictive imagination.

Meanwhile the process of ruin went on, and, quite helpless, I resolved at once to carry out my plan of investigation. Accordingly I went straight to the great Western city which was one terminus of the road in question. A few days made plain to me how rapidly my bandit had matured his plans.

On my arrival in L—— I found two letters. One, from Vincent, said:

I send you a blank check. You must not be incommoded by this scoundrel, or let this trouble break up your life plan. I shall leave you in my will the amount you draw, and you can then repay my estate. Anne and I have talked it over.

The other was from Clayborne.

Dear Owen: It is immensely pleasant to be able to help a man make a fool of himself. If you do not let me pay that woman I will give the money to a homeopathic hospital. You may choose as to which folly I shall commit.

Yours, C——.

I said to myself, these are some of the sweet uses of adversity. So, having made up my mind to accept the loss, and having taken my ticket for the homeward journey, I went out quite at rest in mind to wander in L—— for the hour or two yet left to me. Pausing in the street to ask of an elderly man a light for my cigar, I inquired the name of the owner of a huge house at the corner. The man replied, "Why, that's Xerxes Z——'s. Guess you're a stranger. I knowed him when he was a boy; blacked my boots many a time. Wonder what he'd take to black 'em now?" Surprised to hear thus the name of my foe, I went on; but the house attracted me, and presently I turned back. Then I crossed over, and just at that moment the door was opened by a rather frowzy maid. A sudden impulse seized me. I would see this man if he were at home, and if he were not I would go away, and accept tranquilly the misfortune his avarice had created for me. The woman said Mr. Z—— was at home, and showed me through an unfurnished hall into the parlor. The house was an old one with open grates in which blazed fierce anthracite fires. The furniture was ugly but not extravagant.

I had no plan in mind. I would at least learn what manner of creature this was, and have the poor comfort before I left of telling him what the world of the honest thought of him and his ways.

As a preliminary to our interview, I glanced about me hastily. Several large Swiss landscapes adorned the walls, and there was also an excellent oil-painting of a man in a red shirt casting for trout beside a quiet pool. Near it was a clever sketch of the same sturdy person caressing a beautiful setter. On a marble center-table were piled a few books: a volume of American scenery, Bryant, Longfellow, and Tupper, all with a certain stiffness of back symptomatic of lack of use. One, gorgeously bound, was "Travels in the Holy Land," a gift from the Rev. P. Y. to Xerxes Z., Esq. A volume on the "Education of the Young," by the same to the same. Also memoir of "Travels in Strange Lands," affectionately and gratefully dedicated to X. Z., by his pastor, P. Y. My knowledge was accumulating. In the darkened back parlor was a full length of the fisherman by a great English artist. It looked as if the painter had found pleasure in labeling the visage with his own opinion of the sitter. I wondered at the courage, or the ignorance, which could accept such a vivid commentary; but, as I have said, it was rather too dark to see well this or other portraits, and, observing a single square green volume on the table, I walked back with it to the lighter room, and stood with wonder looking over its few pages. It was made up of old pamphlets containing chess problems, and at the close was an account, written in 1760, of the famous automaton chess-player. On the fly-leaf was the autograph of Von Kempelen, the inventor.

As I looked over the queer little book, puzzled and interested, and knowing, too, something of the fate of the great and really historical figure which had played with Maria Theresa, Frederick the Great, and Napoleon, I heard a heavy footfall, and my host entered—a man tall and broad, with ruddy, coarse, and large features borne on a head which was carried well back and up.

I said, "Mr. X. Z., I presume? And first, before we talk, let me replace this book which I brought from the back room. As a chess-player it interested me."

"All right," he said, and sat down while I disposed of the book, and came back to my host, who was still seated.

"Set down," he said. "What is it you want? If you're a reporter, my secretary will attend to you."

"No; I am not a reporter. To go at once to the mark, I want a half-hour's talk with you."

"You can't have it unless it interests me. What's it about?"

"About the P. L. and C. Railroad."

"Oh, yes; go ahead. That is interesting. Papers say I'm whittlin' it up to buy the chips low."

"Are you not?"

"Well, you are a cool hand. What's in all this? Who sent you?"

"I am a considerable owner of the stock and bonds," I said, "and, as I see that these are tumbling pretty fast, and observe that you have diverted all the natural coal and goods traffic to a longer loop line, and that some one is shoveling the stock out in heaps, I concluded that you are the man who, having organized arrangements to injure my little road, will step in some day and secure the property of myself and others."

I supposed that he would be angry. Not at all. He slowly stroked his long grizzled beard, smiled as I went on, and as I ended said:

"Is that all?"

"No; not quite. I want your advice as to what I shall do."

"Suppose that I tell you to go to the devil?"

"But you will not, or you would have done so at once. I promised to interest you, and you are interested, and, besides, it would be like—well—I could n't go there, because I am there now."

"There? Oh, I see. I am the devil, am I, and you want advice? Sell out."

"I cannot afford to do that. That is diabolical advice."

"Well, hold on."

"That means almost total loss. You are advising me from your point of view; reverse it, and take mine, and then, with what you know, say do this or that. I shall do as you say."

"Oh, will you? I won't do it; it ain't business. Mind, I ain't said I'm in this thing at all. By George! my son Peter's in the same boat as you. He wants advice, too. He thinks he's clever. Well—I advised him, I did. I give him high-class advice. He was grateful, that boy. Hope it'll last. Are n't we gettin' off the track?"

"Yes; I'm sorry for Peter. Of course you must keep up financial discipline."

"That's good. I'll tell Peter that financial discipline must be kep' up in one's own family circle."

"And now, as you have admitted to being in this scheme—"

"I—I did—did I?"

"Yes; you rose to my third fly."

"Look here, I won't stand this. Suppose I am in it? Suppose I am not in it?"

"But you not only rose to my fly, you took it too. You're hooked. Once you are in an affair you go through. You began to advise me, and it is not in your character to fail. Advice is what you yourself, with your knowledge and in like circumstances, would accept. You say, hold on. I cannot. You are trifling, and that is not your nature. You might have

said, I will not advise. I should have taken that, and left; but now you are pledged to find me a way out, and a safe way. You are hooked, and it is time I reeled you in. Three runs are enough."

My host rose up, and set two heavy paws on the table behind which I sat. He looked for all the world like some strong plantigrade beast of the grizzly type. For a moment he regarded me with curiosity, and then broke into a roar of laughter which shook the bulky chandelier-pendants above us. I remained tranquil. At last he said:

"Who 's been a-blowin' to you about me?"

"No one."

"Oh, come now. I rose to the fly, did I?"

"Yes; it looked new to you, and up you came. Fatal curiosity."

"Oh, it is all very well to compare me to a trout, but no man was ever took that simple. I'd like to have old Phil Sleeper with a hook in his gills and a long line and quick water and a multipliyin' reel—hang him."

"I am not Phil Sleeper. The case is reversed."

"Is it? Why, you must be a fisherman yourself. Come here and see this picture. I had Simmons do that; it is just at the outlet of Moosehead. I'm fast to a cast of eight pounds—one five, one three. Ever tie your own flies?"

"Sometimes."

"This morning, I suppose?"

"Yes."

"Rather curious, is n't it, that two men as different as you and me should like the same sort of things—fly-fishin', chess?"

"And how are we different?" I said, much amused.

"You're the queerest man I ever saw—a whole menagerie. By the time you're ten years older you won't have a dollar. How 's that for a guess?"

"Not a bad one. And here is one for you. Some day you will go to bits. I see it in your face."

"Why, I've been worth millions three times, and not a cent next day. Safe this time; got it solid."

"I'm not sure. One more smash, and your nervous system won't stand it. What advice have you? You have wasted quite time enough. Three long runs, sulked a little, two or three dangerous jumps. Now I propose to reel in. You like a man who can outwit you; he is the only thing you esteem on earth."

"That's so. Tell you what I'll do. If you can beat me one game at chess I'll take your stock at par."

"And bonds?"

"Yes; last offer."

"I'll do it," I said.

"Then you're done for, young man. Come along. Who riz to the fly this time?"

I followed him into a small room, bare of furniture except a desk, chess-table, and spittoons. I was looked upon as a good second-rate among our local players, and had a pretty clear idea that I should win. He chuckled as we went in, and, sitting down, arranged the board. He won the move, and opened with the famous but little-known Catapult gambit. I replied with Herr Strombalovsky's defense, and the game went on. I soon saw that he was quite my equal. Presently, having a little view ahead, and his queen being in trouble, I said, "Did you ever see Maelzel's automaton?"

"Never," he returned, abstractedly.

"It used to be in Philadelphia; was burned up; said 'check' in its last moments. Queer that, was it not?"

"Oh, look here, there's a lot of money in this game. If you think—"

I had accustomed myself to talk to a bystander while playing chess, because I found that constant attention never helped me, and that a few moments of intense concentration between moves got the best results out of my chess capacities. I thought a moment, and castled the king. This altered the situation, and while he studiously contemplated the game I went on talking.

"I have an old Dutch treatise on chess. There is one splendid gambit. Never been published. You begin with the king castle's pawn."

"Nonsense! Oh, look here," he said, "I don't believe in new gambits. What is it, anyway? You wait till we're done. Bet you five hundred dollars it is n't new."

Then he moved a knight.

"Check," said I. "I have myself two books of ends of games belonging to Von Kempelen." He made no answer, but moved a bishop to guard the king.

"Check," said I.

"Oh, that's your talk. It's against the rules."

"Nonsense! This is a game of chess, not *the* game. Check again."

"Ever kill a salmon?" I added.

"No; that must be fun."

"There is a boss salmon in the Cascapedia, weighs about ninety pounds. They say he has been hooked at least six dozen times. His mouth is so full of flies and leaders it looks like a beard. They call him the governor-general."

"Oh, bother!" And he moved a pawn.

"Check."

"Euchred," he said. "I give up. It's sure mate in three moves. I give up."

"No; we must play it out. A given game is not won. You would turn around and say I had not beaten you, and decline to pay the forfeit."

"That's just what I meant to do, my boy. I wish Peter was like you. He believes every word I say."

"Check — mate," said I.

"I've lost. What possessed me? You just write to Falls & Sons. They'll settle. Want it in writing?"

"I? No. Of course not. You are free to pay or not. I pestered you with talk. It was hardly fair. Pay or not, as you like. I did not in any honest sense win."

"Stuff and nonsense. Do you suppose, sir, I don't keep my engagements? I don't guess you came here to insult me."

"No; hardly. I really came because I was curious to see what manner of man you were."

"Like going to a menagerie show. Well, you've seen it, and got your money back too; but don't you go and buy a lot more stock now. It's awful low. How much am I in for this gamble?"

I named the amounts; he noted them, rose, and as we went out into the hall said, "Let me see those ends of games."

"I will send you the books. Pray keep them."

"And look here — I never had a better mornin' in my life; but don't you go and tell everybody, and put it in the papers. What's your address? I'll send you the Wall street trout-fly. Peter calls him the bull."

At the door I said, "By the way, I never told you my name."

"That's so!" And he took my card.

"Well, by George! you're a doctor. That's the very queerest thing I ever did know. Why, I never knew a doctor ever knew anything — their own business, or any one else's. How Peter would laugh. But he won't next Monday. Good mornin', Doctor North. Come in again and give me my revenge."

As I turned to go he stopped me. "You said I did n't look well —"

"Yes; I said that. It is something, I cannot tell what, about your eyes —"

"Hum! come back and go over me a bit. I ain't felt well of late, that's a fact. And I can't tell the doctors here. Don't trust 'em." I went in again, and finally remained in the city overnight to complete my study of his case.

"Well," he said at last, "what's wrong with my works? Not much margin, eh?"

"You have a disease of the kidneys —"

"Fatal? Mind, I don't skeer easy. Yes, or no? Out with it."

"Yes; but with care you may live many years."

"How many?"

"I do not know. I will write out my advice for you in full."

"Good. And I may trust you not to let it get into the papers. It would be worth a lot of money to somebody."

"You are safe with me."

"I believe you. You have done me a big service. What's your fee?"

"It is large."

"I don't care. What is it?"

"My fee is that you put that road back where it was a year ago."

"Darned if I do. And take your stock too? No, sir."

"I have reflected. I won't take the money for it. I have told you my fee. Good mornin'."

"I'll do it. No man can say Xerxes Z—— don't pay his debts. Five years? Ten? How long have I got? You'll have to take care of me. I'll send my private car for you every month."

"I will do it. There is even a chance, a small one, of recovery."

"Is that so? Hold on to your stock; buy more; it's pretty low. And come and dine here to-day."

"No; I cannot. I must go. Good-by."

"Well, buy soon. Don't you forget, and hold your tongue, too. It's the biggest bill I ever paid. You're not a cheap doctor."

XERXES was as good as his word, but I bought no more of the stock. In a year or two I was better off than before. Nevertheless, I did not appear to myself well in this transaction. I had used the robber's methods to overcome the robber. It was true that I had estimated correctly the character of Mr. X. Z., but to meet the demands of the situation I had acted against my own habitual ways. To this day the first part of that little affair sits like a toad in one corner of my mind and sneers at me. It is the one thing I have never told Vincent. I merely said to him on my return that I was resolved to wait, and have been much applauded for my sagacity. Also, I am free to admit that I did pull the great financier through his physical difficulties. He lived to do untold mischief. I was once standing on a pier in London when a thief, sharply pursued, in trying to jump into a wherry, fell overboard. He sank twice, when in dashed a huge Newfoundland and towed the unconscious rascal ashore, where he was promptly seized by the police. For my part, the behavior of that dog interested me. He shook himself, and settled down in the sun on the pier with a look of distinct self-gratulation at his feat. The morals of the drowning man did not concern him. I have often thought about that dog.

S. Weir Mitchell.

SHERMAN AND THE SAN FRANCISCO VIGILANTES.

UNPUBLISHED LETTERS OF GENERAL W. T. SHERMAN.

[LETTERS written during the time of the great Vigilance Committee of 1856 at San Francisco, and containing some account of its work as viewed by an interested resident of the place, are rare in the literature of the subject, and are sure to be valuable. How much more must this be true of letters written under such circumstances by General W. T. Sherman! The case for the Vigilance Committee is authoritatively stated in the November number of this magazine, by the former president of the committee, Mr. William T. Coleman. Sherman's relation to the committee has been described by himself in his "Memoirs," and that account has led to considerable controversy. As major-general of the State militia, he was, until his resignation in June, the official opponent of the committee. His "Memoirs" criticize its doings with severity; and the defenders of the committee have replied with vigor. The "Memoirs," written long afterward, it is claimed contain, as regards this portion of their text, some obvious historical errors of detail; and on this ground argument has been made against Sherman's whole case. It is therefore especially fitting that his later statements should be either corrected or borne out by means of his contemporary record of his impressions. Such a record the following correspondence furnishes.]

Of General Sherman's own position during this period, it remains here to point out how hard a one it was. As a banker he was as much interested as were others of his class in the purging of the community. As a business man, moreover, he was also naturally disposed to act so as not to alienate his fellows, who were nearly all in sympathy with the movement. In fact, as the following letters clearly show, he was himself not at all devoid, at the outset, of an appreciation of their motives. But not only was he opposed to the committee from the strongest conviction of the general impolicy and the special danger of the movement, as his "Memoirs" show, but having accepted the Governor's appointment as major-general of the State militia, he felt the loyal instincts of the soldier setting him actively against the extra-legal position of the committee. It was his duty to act with the Governor. But the Governor began by an effort to treat privately with the committee. The effort led to a controversy in which a question of veracity was soon involved, and Sherman still sided with the Governor. A little later, he had to undertake the trying task of raising a force of militia in a community where only a small minority sympathized with his cause. Arms were lacking. Appeal was made to Major-General John E. Wool for the use of the arms at the United States arsenal at Benicia. The appeal led to another controversy, which soon involved another question of veracity. Meanwhile Sherman

had not forgotten his right and his duty to seek such terms of compromise with the leaders of the committee as could be honorably obtained, through the aid of certain conciliatory persons who were anxious to act privately and unofficially as intermediaries. These efforts at mediation were thwarted by Judge Terry and other violent counselors who had the Governor's ear. Thus all Sherman's plans were defeated; he resigned his commission to the Governor, and returned to his private business. Henceforth he remembered the committee with increasing disapproval.

The story of these matters fills up most of the letters here printed. In following the incidents of the time, the reader may be aided by a table of chief events and dates, mostly chosen from the early history of the committee.

Wednesday, May 14.—King publishes an article concerning Casey, the "Bulletin" appearing about 3 P. M. Between 4 and 5 P. M., King is shot by Casey, who is imprisoned. By 6.30 there is an excited crowd about the jail, which the mayor tries to disperse. Excitement continues all the evening, with public speeches, resolves, etc. Later Mr. Coleman and his friends prepare the "call of the committee of thirteen" for the morning papers, and agree on a plan of organization for a vigilance committee.

Thursday, May 15.—Vigilance Committee begins the general organization, and the Executive Committee begins secret meetings.

Friday, May 16.—Drilling of members of Vigilance Committee begun on a large scale. Sheriff Scannell calls for the posse to defend the prison. Governor Johnson arrives in the evening from Sacramento, and interviews privately the vigilance leaders.

Saturday, May 17.—Vigilance Committee removes to its permanent quarters on Sacramento Street. The vigilance guard of ten admitted to the city prison. Orders privately given for the movements of next day.

Sunday, May 18.—Vigilance guard early withdrawn from the prison. Seizure of Casey, and an hour later of Cora, accomplished shortly after midday by the whole assembled force of the committee.

Tuesday, May 20.—King dies of his wound about 1.30 P. M. Casey tried by the Executive Committee for murder that evening.

Thursday, May 22.—King's funeral. Execution of Casey and Cora.

May 23-31.—The committee continues its activity by arresting persons, investigating cases of election frauds and of similar offenses, and by preparing to banish offenders.

May 31.—"Yankee Sullivan," a prisoner of the committee, commits suicide at its quarters. At Benicia, in an interview between General J. E. Wool and Governor Johnson, Sherman being present, Wool makes what both Johnson and Sherman interpret as a promise of arms from the United States arsenal for the suppression of the committee.

June 3.—Governor Johnson issues proclamation declaring San Francisco to be "in a state of insurrection."

June 4.—Governor Johnson, by the hand of his aide, Colonel Rowe, forwards request to General Wool for the needed arms from the arsenal at Benicia. At San Francisco, members of a "conciliation committee" carry communications between Sherman and the Vigilance Committee, hoping to bring to pass some peaceable settlement.

June 5.—General Wool replies that he has no authority to grant the Governor's demand.

June 7.—Governor Johnson repeats his demand upon General Wool for arms, making a formal and urgent requisition. At Benicia, on the same day, the Governor meets Sherman and the "conciliation" delegates from San Francisco. The peace negotiations fail. Sherman resigns his commission as major-general of militia.

June 9.—General Wool finally refuses to aid the Governor against the committee.

June 19.—The Governor writes to the President, asking for national aid in suppressing the committee.

June 21.—Judge Terry at San Francisco resists and stabs a vigilance policeman, and is arrested.

July 19.—The President writes from Washington, declining, on grounds of constitutional law, to interfere to suppress the Vigilance Committee.

July 20.—Hetherington and Brace hanged by the committee.

August 7.—Judge Terry released by the committee.

August 18.—Final parade of the Vigilance Committee.

November 3.—Governor Johnson revokes his proclamation.

The fullest account of the Vigilance Committee yet printed is that in the second volume of H. H. Bancroft's "Popular Tribunals." The official correspondence of Johnson, Wool, President Pierce, and others, relating to the affair, is printed in the "Senate Executive Documents," 1st and 2d Session, 34th Congress, Vol. XV., Doc. 101; and 3d Sessions, 34th Congress, Vol. VIII., Doc. 43.—EDITOR.]

THE SHERMAN CORRESPONDENCE.

I.

[Extract from a letter, no date, from General Sherman to Major Turner of St. Louis, contained in a letter from Mrs. Sherman, dated May 18, 1856, to her father, Mr. Ewing. The letter to Major Turner, as appears from its contents, was also completed on Sunday, May 18, but was begun on Saturday.]

THIS steamer will bring you news of most distressing character, growing out of the shooting of James King of William, editor of the "Evening Bulletin," by Casey, editor of the "Sunday Times," the same man who so recklessly attacked all the bankers and decent people of the city. I will send you so many newspaper extracts that I may confine my letter to my own personal history, and I beg you to preserve this, in view of any untoward events, in which, in spite of all caution, I may become involved.

Shortly after the sailing of the last steamer, several gentlemen connected with the volunteer companies of the city mentioned that Governor Johnson would offer me the appointment of Major-General of the Second Division, California Militia. I expressed a strong disinclination to do anything at all, and hoped the Governor would do no such thing. The Governor soon after called in person and offered me the appointment. I expressed a dislike to do anything that might distract my attention from business. He assured me . . . that it

was simply for the purpose of organization, and that no expense would be incurred and little time needed to perform its duties. I gave a reluctant consent, which, at the time, I felt to be imprudent. Last Saturday, feeling the want of exercise, I crossed the bay to Oakland, got a horse, and took a ride over the mountain toward Monte Diablo, making a circuit back to the city. On my arrival, on Monday, I found a commission awaiting me, which I accepted, and wrote for a copy of the laws governing the militia, meaning to take my time to appoint a staff and do what seemed requisite. On Wednesday, after bank hours, I came home, and about half-past eight o'clock Bainbridge and Helland came out and told me that King had been shot by Casey, and that excitement ran high. King's articles have all been provoking, and I have long expected him to be attacked, and therefore was not astonished; and had the populace got Casey that night and hung him, I would have rejoiced, but Casey was smart enough to have himself confined to the jail before feeling had become concentrated. The mayor called out the volunteer companies—three of infantry amounting to some sixty men turned out; a few straggling, mounted men and about a dozen men stood by two guns, six-pounders. That night passed off without violence, and next morning, Thursday, I went to the bank as usual, when I found everybody intensely excited, threats to take Casey and Cora and hang them, and a revival of the old Vigilance Committee. A public call was made for the old members of that committee at a certain room, round which was gathered all day a large crowd. I went to the mayor, Van Ness, a large, good man, but as usual so mused up and involved in old business that he could do nothing. I then saw the officers of the volunteer companies, and found them wavering. I went to the jail and found the sheriff, a strong, gross, bluff, athletic man, surrounded by his deputies, in a kind of anteroom, excited, and apprehending an attack on the jail each moment. . . . I informed the mayor that the jail could not be defended, that the mob could occupy a few of the buildings, and completely drive out any posse the sheriff might command. What complicated matters was that the sheriff and his friends are "shoulder-strikers"—the very class against which is raised this storm of indignation. Colonel West, Major Johnson, and a few of the volunteer officers thought maybe in the course of the day they could prevail on some of the volunteers to act, when I pointed out to them that the only possible way to hold the jail against a mob was for the sheriff to occupy the jail with his deputies, the police, and such citizens as would serve as a posse, and

the military companies to occupy such buildings round about as would prevent their occupation by the mob. I then went about my business, but went down town that night, walked about town, and found, as I expected, that the volunteer companies had not turned out, that there had been no mob, but that the Vigilance Committee were in session, enrolling men, and keeping up a secret dread of some violence. Friday was the same continued excitement, but no direct attack on the jail or direct interference with the civil authorities. On Friday afternoon the mayor called on me, saying he had telegraphed to Governor Johnson to come down, and had received an answer that he would be down that evening, and he requested me to meet the Governor at the boat at half-past nine. About the same time a formal writ was served on me commanding me to meet the sheriff at the Fourth District Court-room at half-past three P. M. I went, and found about a hundred people who had been summoned.¹ The sheriff called out the names of all on whom the writ was served, and it seemed about one third had come. These were mostly lawyers or persons in some way friends to those in jail. . . . The sheriff commanded all to accompany him to the jail, to obey the law and prevent rescue. I did not go, but told the sheriff that I had to be at the Sacramento boat on its arrival. I came home to dinner, and before leaving the table, Hall McAllister and another gentleman came out and said that the posse comitatus at the jail, composed of some sixty gentlemen, had organized at the jail by electing me as captain, that it was understood to be indefensible, and all wanted to see me. I explained to them that I could not act as captain of a sheriff's posse; that the sheriff was of law and necessity to command their services; that I was major-general or nothing; that there were no forces and I could not exercise military command at all; that I had an appointment to meet the Governor, with whom I should probably be engaged all night, but that I had no objection to give my advice and counsel. I went with them to the jail, found there the sheriff, his deputies, and policemen, amounting to about thirty men, and the citizen posse. They clustered around me, anxious and concerned. The duty was a most disagreeable one, to defend a jail against an infuriated mob, to defend two such scoundrels as Casey and Cora. I told them frankly that the only influence their presence could exercise was a moral one, the consciousness of sacrificing their comfort and endangering their lives in the maintenance of

organized law, as against the violence of a mob. I pointed out the weak points, and concluded that to defend the jail successfully certain buildings outside must be occupied. Upon examination, this move was too late, for the Vigilance Committee had them all filled. There was no alternative but to desert or stay in that open corral. The night was bright moonlight, and beautifully serene, contrasting with the tremulous fears of the doubtful and the growing passions of the determined. I became satisfied that unless King (from whom bulletins of health came forth almost every hour) died, there would be no direct attack upon the jail until the Vigilance Committee had strengthened themselves by enrolling their entire force. At half-past nine o'clock Friday night, I went to the Sacramento boat to meet the Governor; found his brother and Captain Garrison waiting for him too. The *Senator* came along the wharf; we stood at the after-gangway, but the Governor did not come ashore. Soon we heard he had passed up the wharf, having landed from the lower deck at the forward gang-plank. So we followed him up to the International Hotel and there found him. Johnson is a young man, very pleasing in his manners, a lawyer of intelligence, and I am satisfied, if he had the power, would sustain the law. We told him all that had occurred, described to him the position of things, the small civil force the sheriff had, the danger of the posse of good citizens, who, at his call, were now gathered together at the jail. We went thither, when he saw for himself how utterly indefensible the jail-yard was, open to the rear, overlooked on all sides by brick houses with parapet walls,—no part of the interior of the jail safe from shots but the cells, which are full of prisoners; the wall at one corner almost undermined, a large wooden gate on a side alley which could be cut through in a minute. Indeed, if I were forced to meet an armed mob, I would rather be in an open prairie than in that jail. The Governor saw the entire mass of people arrayed against the civil authorities, the only military force in existence sharing the feelings of the people, the cause of the civil authorities being a bare naked principle with two such wretches as Casey and Cora as its exponents. All this time the Vigilance Committee was strengthening its numbers, then 2500, now 5000, having at its head such men as William T. Coleman, the brothers Arrington, Flint, of Flint, Peabody & Co, Myras Truett, and indeed all the large merchants, active controlling members, whilst Parrott, Ralston, Drexel, Sattler and Church and most of the rich men are contributing means and countenance sub rosa. I suggested to Johnson for us to go right to their headquarters at the Turn Verein Hall on Bush

¹ The San Francisco "Herald's" list of those enrolled at this meeting contains 54 names.—EDITOR.

street, and we all concluded to go — Garrison, the Governor and his brother, and myself. We reached the hall about eleven o'clock at night, found it lighted up and a stream of people coming and going. . . . After a little delay we were admitted into a bar-room at the right, where we sat down and Mr. Coleman, President of the Vigilance Committee, sat down and had a very general conversation, in which Coleman said the purpose of the association was not designed to subvert the law but to assist it in purging the community of the clique of shoulder-strikers, ballot-box stuffers, and political tricksters generally; that the courts and juries had become of no use, and that they must be purged or spurred on; that they did not meditate violence, and were willing to await King's fate. If he dies, Casey to be tried and speedily executed. All this was fair, and we almost coincided with him in opinion. At first he intimated a desire that Casey should be given up to them, but Governor Johnson told him distinctly that he would enforce the law as speedily as its forms would allow, but he would never consent to Casey being taken from the sheriff's custody; but that if the committee felt any uncertainty about Casey's being safe in custody there was no objection to a few men of their number being admitted, who were to be considered as assistant-guards but under control of the sheriff. It was then agreed that if such an arrangement were made that the committee should pledge themselves that those of the committee so admitted should not attempt any violence or league with those outside, but if a change of purpose became necessary the committeemen should be withdrawn and reasonable notice given. Coleman then went into the large hall, and after some time returned with six other gentlemen, with whom further conversation was held, all to the same effect, and the treaty was made verbally, Governor Johnson telling them that he treated with them as individuals, and not in their capacity as a body of men leagued together for a purpose unknown to the law. We were there till half-past one at night, and parted with a clear, distinct understanding that no mob violence was contemplated at all, and no demonstration on the jail should be made until their guard was withdrawn and reasonable time thereafter to enable the sheriff to resume the status quo. We agreed to meet at the jail at two o'clock to admit their ten men — the sheriff being at liberty to keep as many as he pleased. We went to the jail, found the sheriff disinclined to admit the enemy, but as he could not depend on the citizens to defend the jail, he became satisfied his only chance of life was to save time, and therefore consented. At two o'clock Friday night ten men of the Vigilance Committee were

introduced, and a room in the jail placed at their service, and one or two of them were allowed to stand or sit near the cell door in which Casey is confined. Coleman and Truett came with their posse, assured themselves that Casey was there, and we all left, thinking that, under the circumstances, it was the best thing then at our choice. We all parted Friday night at three o'clock, satisfied to await King's fate, and believing that the community at large would be satisfied.

SUNDAY, 12 o'clock.

Governor Johnson has just sent for me. He is at the International Hotel on Jackson street. My belief is that the leaders are not able to control their men, and that they will be forced to extremity. I believe Casey and Cora to be doomed; if the sheriff resists and blood is shed no man can foresee the result. All the elements of the Paris committee of safety are here, and once put in motion they cannot be stopped. I regret having been placed in this position, but I am bound in honor to serve the Governor of the State to the best of my means and ability.

2.15 P.M.

I have just returned to my house. I went to the International, and on my way saw crowds hurrying in the same direction. When I reached the hotel I found the Governor and mayor on the roof along with many others. He simply pointed toward the jail; all the houses commanding a view were covered with people. Telegraph Hill was black with them, and the streets were a complete jam. He told me that the committee had sent him word at half-past ten that they would withdraw their men, and the treaty was at an end. Johnson went immediately to the jail and found the sheriff with his deputies and a few citizens. The sheriff has been firm and constant, and he very properly asked the Governor to give him some orders how to act in case the committee demanded his prisoners. The Governor told him that, if they appeared with sufficient force to make resistance idle, he might surrender his prisoners under protest. If the sheriff should fire on that mob the immediate result would be terrific, whatever the future effect and consequences yet in the lap of futurity may be. Well, shortly after, the masses of people began to move toward the jail, covering all the houses and hills, soon followed by the committee in full organization, 2500, armed with muskets, rifles, a field-piece, besides as many more arm-in-arm, silent and quiet, whilst at least five thousand men flocked up as to a show. When I reached the roof of the hotel there must have been *at least* ten thousand people within a rifle-shot of the jail. Soon a man rode by on a white horse, followed by a carriage which stopped at the jail door; soon a shout announced success, and the procession began

to move from the jail, down Kearny to Pacific, Pacific to Montgomery, Montgomery toward Sacramento, when I lost sight of them. It was headed by two platoons of about sixty or eighty men, with bright muskets, then the carriage with Casey with two files of armed men on each side, these followed by a promiscuous crowd. A great many armed men appeared to remain at the jail. This Vigilance Committee seem to take the old one of 1852 as their model, and as that one hung their prisoner at 3 P. M. on Sunday, I take it for granted that before the ink dries on my sheet, Casey will be hanging from some beam out of some committee-room of that power that now governs San Francisco. Soon after the passage of the crowd Sheriff Scannell and his deputy, Harrison, came on the roof of the hotel to see the Governor, but he had disappeared; we descended the roof to his room, but he was not there; we searched through the hotel without success.

Whilst this was transpiring, Scannell told me that Coleman and Truett were the spokesmen; that they demanded Casey, whom he surrendered under protest. They took Casey from the jail and despatched him in the manner I have stated, and then demanded possession of the jail.¹ This not being contemplated, his instructions did not cover the case, so he and his deputy ran down to see the Governor, and thus far he has not seen him. But I did not stay long. I came home. San Francisco is now governed by an irresponsible organization claiming to be armed with absolute power by the people. The government is powerless and at an end. I don't care if they take the jail, the courts, and what they please. Coleman told me he thought they could control the movement; I doubt it, for reasons I will now proceed to explain in continuation of the events of yesterday. On Friday night we made an agreement with the controlling members of the Vigilance Committee that, to be assured of no complicity of the sheriff with his prisoner, they should have a force of ten men nominally under the orders of the sheriff. Yesterday the sheriff suggested to Johnson to try and get the number diminished to five, when he would reduce his force in proportion—this under the supposition that no attempt to take the prisoner would be made until King's fate were determined. So yesterday at 1 P. M. the sheriff asked me to walk with him to the committee to make the proposition. We found new men—a new tone—and a positive refusal to reduce the number. In reannouncing the conditions agreed on the night before, we claimed

that *reasonable* notice should be given; that, too, they denied. New elements were at work, and outside pressure was brought against them which they could not resist; an absolute issue of fact presented itself, and Governor Johnson found himself in a most delicate position: to have conferred with an illegal body; to have admitted spies and enemies in the jail. We asserted so positively this change of promise, this want of truth, that we agreed to bring Garrison; we found him about 4 P. M. and his memory was positive, and with him we again went to the committee-rooms; again a change of men more rabid than ever, asserting that they never contemplated a trial of Casey save by themselves. This was so utterly at variance with their stipulations of the night before that we sent for Coleman and Arrington and one other who was present the night before, and these had to confirm our version of the agreement; quite an angry debate followed among themselves, showing a division of purpose, the very object we had in view.² But, as always, the most violent prevailed, and the honorable stipulations of Friday night were thrown on Mr. Coleman individually. Coleman reiterated them, and as no conclusion could be come to, they asked to advise with the society and agreed to come to the hotel at half-past eight last evening. They did not get there till a quarter past nine, and made short work of it. The society had overruled Coleman, and would make no promises or pledges, but simply agreed to give the Governor notice before they withdrew their men, which we all knew was to be the signal of attack. This morning's notice and the taking of Casey are told.

The hanging of Casey and Cora are trifles compared with what may follow. The Vigilance Committee are now in full possession of San Francisco, and in a free American country, where we pay taxes of four per cent. on full valuation, we are now at the mercy of irresponsible masses. To be sure, the heads and guiders of this business are deemed some of our worthiest and best men, who profess to improve on the law and its administration. They may succeed; they say they did so succeed in '52 ['51], and a few days or weeks will demonstrate. There are vast numbers of men here, desperate, too lazy to work in the mines, unable to go away, strong for mischief and powerless for good. This class did not exist in '52. At all events, I am not implicated with it, and, though it may be impossible, I will endeavor not to provoke the special enmity of our new rulers.³

¹ This statement of Scannell's was in part inaccurate. The next demand, after taking Casey, was for Cora, and they gave the sheriff another hour to comply. The demand for "possession of the jail" was made as a formality, in writing, and *before* Casey was taken.—EDITOR.

² Rumors of such "division of purpose" were very soon abroad, and are mentioned by the San Francisco "Herald" of the next day.—EDITOR.

³ Rumor at this time also asserted that Governor Johnson had approved and consented to the seizing of

II.

W. T. SHERMAN TO HON. THOMAS EWING.

BANKING HOUSE OF LUCAS, TURNER & Co.,
SAN FRANCISCO, CAL., May 21, 1856.

(In haste)

MY DEAR SIR: I take it for granted you will be sufficiently alarmed at the condition of affairs here as reported by the papers. . . . There is no doubt that James King of William was indiscriminate in his abuse, but the public offices heretofore having been controlled absolutely by politicians who did not scruple to use such men as Casey, Billy Mulligan, Charley Duane, *et hoc genus omne*, all graduates of New York prisons or political clubs, the public generally approved King's bold course in assailing that class of men, at the same time refusing to fight a duel.

Our courts here and our authorities are about as good or as bad as you would expect from the elements that make up our population. They have all been elected by the people themselves, either as Democrats or as Know-nothings. Nevertheless the merchants and people who despise the kind of men who hang around the polls, the public offices, the courts, etc., are and have been perfectly sick and tired of the class of men referred to; therefore, when James King began his career and pitched into the rowdies with such zeal and boldness, he met an unexpected encouragement which on several occasions upset his vanity. The murder of Richardson by a low gambler, Cora, and his acquittal raised the same feeling against the courts, and it is useless to talk to our best men here about them; they assert, with some show of truth, that any man with money can, through the sheriff, so pack a jury that they cannot agree. All these elements were rife when King was shot by Casey, one of the most skilful politicians of his day—he is a New York convict, editor of a newspaper established here to levy blackmail, and a member of the Board of County Supervisors, when he was not even a candidate. He himself admits that during the election he did not propose to have himself elected, but when they commenced counting the votes he found his opponent in wire-pulling and rowdism—Yankee Sullivan—had been stuffing a little too strong. He got tickets printed with his own name, and caused the inspectors to put them in the ballot-box, and to declare him (Jim Casey) elected. These facts, 't is said, are notorious, and were well known to the Board of Supervisors, when by vote they declared him elected. The Supervisors control the county expenditures, and it is said they share

Casey and Cora. The "Herald" (anti-vigilance), while not believing this rumor, speaks with great severity of Johnson's conference with the committee.—EDITOR.

every appropriation made. It is not then astonishing that this murder in broad daylight in the very center of the city should produce such commotion. I was not surprised to learn the next morning after the occurrence that the jail had been threatened, and that a deep-seated determination existed to hang him whether King died or not. By circumstances I was compelled to examine the jail and see how far the military companies could sustain the civil authorities. The military companies shared the general sentiment, and would not risk themselves to defend such rascals as Cora and Casey. The whole mass of the people were of like sentiment. The city police is small, mostly distributed about the courts as messengers, etc., and of the very class of men against whom the storm was brewing, and the sheriff, also a "shoulder-striker," was absolutely abandoned by his friends. At no time, by concentrating these discordant elements, could I count on more than one hundred inexperienced men. The jail, too, is a single-story yard, with a cluster of cells, covered with a roof of one-inch plank and tin; its front is above the grade of the street, but the hill rises so rapidly to the rear that its back wall and roof are absolutely flush with the ground, so that you walk down the hill and on the roof without losing step; the whole interior is overlooked by a great many houses all round it. With equal numbers I would rather have been outside than inside. I therefore advised the sheriff how to act should he be assailed by an indiscriminate mob. I had been appointed, by mere accident, the day before King was shot, a major-general of militia, but I have never attempted to exercise authority, because there were no forces, or what few there were in the shape of volunteer companies were on the other side, or so unreliable that none but a fool would count on their fidelity in time of real danger. Therefore, whenever called on I have advised, but have declined to attempt action without reliable men. As long as the matter rested with an unorganized mob there was little or no danger, but soon it was observed that all the discordant elements were drawn together under the name, and after the precedent, of the old Vigilance Committee. Long lines of men were seen passing in and out, oaths were administered, depots opened for recruits, muskets, rifles, and cannon bought, subscription papers carried round in broad daylight, and no one could help it. Over one thousand sworn men were banded together, and William T. Coleman, one of the largest merchants of this city, son-in-law to Daniel D. Page of St. Louis, and a man of fine impulses, manners, character, and intelligence, was made president. He has not much education and not the least doubt of himself, his motives

or intentions. The legal government of San Francisco was paralyzed, and the mayor in his helplessness telegraphed the Governor, who came and was as powerless as anybody else. The entire community was on one side. The new organization was the power, the only organized power here, and with the design of saving bloodshed we put ourselves in communication with them. They assured us as men, as acquaintances, etc., that they would commit no murder, no bloodshed, no violence; but that justice, summary justice, must be done. I cannot tell all that was done, and how futile that was. The papers will blame Johnson for treating with the enemy, but there was no other person, and he had to attempt that or nothing. Now King is dead and Casey is a murderer; Cora is a murderer; both must be hung; far better were it if they could be hung by law, but the Vigilance Committee cannot help themselves. All business is stopped, and immense masses of men idle in the streets watching for blood. Thus far the committee have been exceedingly cautious — a little too much so, for the masses may become uncontrollable; yet thus far no violence has been committed, and I have the most positive assurances from their leaders that none is intended — they even pay the passage to New York of such rowdies as cannot pay their own. They declare their intention to purge the city of rowdies and criminals, but they also have shown an enmity to the free expression of opinion that looks like other similar events of history. These events have shaken my confidence in this city, and once or twice I have wished that [my family] were in a safe place, and regretted that I ever incurred the expense of my dwelling-house, which must tie me down here. Of course I myself cannot leave here, but if matters do not improve, I may at some future time accept your kind offer to take them home till such time as I can properly return. . . . Understand, I fear no molestation of person, but I fear the effect of this on property, on money, and credit.

Your son, W. T. SHERMAN.

[The above letter was written to the Hon. THOMAS EWING, Lancaster, Ohio.—EDITOR.]

III.

SAN FRANCISCO, CALIFORNIA,
June 16, 1856.

HON. THOMAS EWING.

MY DEAR SIR: *The Golden Gate* arrived yesterday, Sunday, and brought Ellen her home letters, which contribute very much to her happiness. I know full well that you will feel

a deep interest in events passing here, and that to a perfect understanding of the part I have played, you will want more exact relations than our newspapers will give. You already know of the hanging of Casey and Cora by the Vigilance Committee. When that was done we all supposed the Vigilance Committee would have adjourned and things be allowed to resume their usual course, but instead, they hired rooms in the very heart of the city, fortified them, and each day the papers announced some act that looked like a perpetuation of their power, such as constructing cells, arresting men who were supposed to have been concerned in previous ballot-box stuffing. On the 30th of May I received from Governor Johnson a telegraphic despatch dated at Sacramento, requesting me to meet him at Benicia, which you know is the site of the United States Arsenal. . . . I went up and Johnson came down, and we met at General Wool's room at the American Hotel. After some preliminary conversation Governor Johnson stated that in the discharge of his duties as chief executive of the State it might become necessary for him to call out the militia to enforce the laws, but that he had no arms or munitions of war, of which General Wool had control of an abundance, and he inquired if in the case stated he could depend on a supply, saying the same could be deducted from the next year's quota of the State of California, or that he would pledge the credit of the State to pay for any loss. . . . General Wool replied in substance that "no person except the President of the United States could grant arms or munitions to a State in case of an insurrection, but a case might arise when a general of a division might take the responsibility and this might be one."¹ The next day by invitation we all went with the general to inspect the arsenal, where we found an abundance of material. After the inspection the Governor, his brother, the Secretary of State, and myself rode over to the Navy Yard, where we found Commodore Farragut in command of the yard and Lieutenant Boutwell in command of the sloop of war *John Adams*. Our purpose was to ascertain whether we could get the assistance of the sloop of war, to drop down to the city to serve as a kind of depot, the city being in absolute possession of the Vigilance Committee. At the Navy Yard we were unsuccessful, the officers being unwilling to commit themselves to anything in a controversy of the kind. We returned to Benicia same day, and on our way back I impressed on Governor Johnson the necessity of having General Wool commit him-

¹ In a letter of June 9, addressed to Johnson, Wool admits having said in these interviews, when "strongly pressed," "that a case might arise when I might deem it proper to assume the responsibility of issuing arms

on your requisition." The same admission is made in a letter to Sherman which formed Inclosure No. 3, sent by Sherman with the present letter, but not printed here.—EDITOR.

self completely, and as we expected the boats along about 7 P. M., the Governor designing to return to Sacramento and I to San Francisco, General Wool accompanied us to the wharf, where Governor Johnson called him aside with me and said, "Now, General, all our plans turn on you; in case I am compelled to call out the militia can we depend on you for the arms?" General Wool said, "Yes." The Governor then asked "as to the form of the receipt or requisition," when the General said, "Never mind, when the time comes you send me a requisition and I will see that it is attended to." I was satisfied with this. On the 1st of June a writ of habeas corpus was issued by Judge Terry of the Supreme Court, in San Francisco, commanding the sheriff to bring before him the body of one Mulligan, known to be in the cells of the Vigilance Committee.

That writ was disobeyed or resisted, and the fact certified to the Governor at Sacramento, who on the 2d inst. wrote me the order which you will find embraced in my printed orders.

Although I supposed he designed to issue a proclamation, I of course acted on his orders to me, and issued mine, in which you will see that I declared that I did not commit myself to the past, but only undertook to enforce all writs issued after that time.¹

This order was put into the hands of the printers that afternoon, and about midnight I received from Governor Johnson a letter saying he would send his proclamation down by telegraph that night, and asking me to cause it to be published in all the morning papers. I waited until past one o'clock that night at the telegraph office, and received the proclamation and caused it to be published as directed. The proclamation was stronger than I expected and more than I would have advised. I did not think it necessary to declare the county in a state of insurrection. Still that was none of my business. The publication of the proclamation and my orders caused a tremendous excitement. Everybody supposed that civil war would forthwith be inevitable and the Vigilance Committee were alarmed at the course of things. They immediately despatched their prisoners, who were no loss to the country, and here things might have stopped. This occurred at the time of the sailing of our last steamer, viz., June 5.

Men began to enroll on the side of the authorities. Companies began to form, and the moderate people became much alarmed

as a conflict seemed to be pending. All the time, however, the Vigilance Committee were strengthening in numbers and in material. Messages came to me that the committee were done, with the exception of warning out of the country certain loafers and men against whom they had undisputed testimony of having been concerned in former election frauds.

As men were enrolling on our side pretty fast, the Governor sent by his aide-de-camp, Colonel Rowe, to General Wool a letter requesting him to issue to me, on my requisition, such arms and munitions as I might call for. That letter was handed to General Wool at Benicia, who replied to Governor Johnson in writing, a copy of which I send you, marked "1," and told Rowe that in the then state of feeling he thought it unsafe to send arms to San Francisco. When Rowe told me this I was thunderstruck, as I could look nowhere else for arms, and the idea of enrolling the militia without arms was an absurdity. I waited a day to hear from the Governor of General Wool's exact reply to him, and it not coming, I wrote to General Wool myself, on the 6th, a letter, a copy of which, marked "2," is inclosed herewith. This was on Friday. On Saturday I received from Governor Johnson Wool's reply to him, also a message to meet him again at Benicia.

That was the most eventful day of this affair. I had absolutely kept secret the refusal of arms by Wool. I had not yet received his answer to my letter, and hoped he would stick by his verbal promise. At the same time a committee of our best men were going between me and the Vigilance Committee, to see if at an interview with the Governor the whole matter could not be arranged without an appeal to arms.²

This committee ascertained that the Vigilance Committee would forthwith discontinue any military display on the streets; that they would make no more arrests; that they would submit to the service of any writs, either to take parties out of their custody, or for their own arrests to answer for past acts. They would not publicly disband, as they said they had to perfect their record to justify former acts of violence by them, and they wanted to coerce certain offensive men to quit the country, but to accomplish this purpose they would not seize their persons, or if they did the sheriff might take the men if he could find them. They wanted a back door out of which to escape, and I was willing to afford it to them, for I knew their strength, and our weakness. I did

¹ These documents inclosed with the present letter are not printed in the present publication, as they contain nothing previously unknown.—EDITOR.

² As to the negotiations for peace, compare the above with the article in the "Overland Monthly" for November, 1874, and with Sherman's "Memoirs."—EDITOR.

all I could to separate the principle from the facts. The Law and Order party, as we were styled, was in public estimation synonymous with the rowdies, shoulder-strikers, and ballot-box stuffers, and our only chance to undo the effect of such clamor was to admit the fact that crime had not been punished heretofore as it ought, and that the ballot-box had been in the hands of rowdies and loafers, but that instead of violent remedies the true course was to devise some legal mode of redress. I thought if we could array on our side all citizens who thought the committee had gone far enough, we would be able to take a bold stand.

My purpose was to use this committee as intermediaries between the Governor and the Vigilantes, if for nothing else than to establish the fact the Governor was right and the committee wrong, and thereby force the moderate men of the city to take our side. We went to Benicia, got there about one hour before the Governor came in the Sacramento boat. I conducted the committee, of which Mr. Crockett was chairman, to the hotel and introduced them to General Wool. I then asked General Wool for an answer to my letter, but he said, inasmuch as I was there he would only say that his answer was the same in substance as his to the Governor. I endeavored to get him to reconsider, but he would not, and it was with great difficulty I succeeded in getting from him the written answer he had before prepared, herewith marked "3," and which he wanted to withhold when he knew I had come up. About dark the boat arrived with Governor Johnson. I hurried to the wharf to meet him, and found him in company with certain gentlemen known to be of the most ultra kind, men of violent feelings and who were determined to bring about a collision of arms if possible. I withdrew him, and he wanted to know if it was true a Committee of Vigilantes were up to see him. I told him no, they were not Vigilantes, but moderate and respectable men, who as yet have not taken part one way or the other, and who represented that middle class out of which we would have to derive our strength. I hastily explained to him that the enrollment of men was proceeding slower than I wanted, and that our cause was hopelessly lost if Wool's decision got out. Governor Johnson was so incensed, and justly so, at Wool's course that he would not stop at the same house, and proceeded to the Soland Hotel, some two blocks further from the water. I talked with him till he reached the hotel and supposed I had disabused his mind of the impression he had received that the gentlemen who had come up to see him were Vigilantes; and when he said he would see them, I returned and told Mr.

Crockett that the Governor was ready to receive the committee. They started, and in some fifteen minutes I followed, and found the Governor in a kind of parlor over the bar-room at the Soland Hotel, and with him were Judge Terry, an editor from Sacramento, Colonel Baker, Jones, of Palmer, Cook and Company, the men against whom of all others in the State there lie the most violent prejudices, and who knew that I did not like them. On entering the room I asked, "Where is the committee?" "They are writing something in another room." I thought that was right, to reduce the points of their proposition to writing, that no further mistakes should occur, and was surprised when a subcommittee came in the room with a written application to come into the Governor's presence. I now inclose a slip of newspaper in which that interview is described by the committee itself. Johnson did not mean discourtesy, but the committee would not believe otherwise, and the whole effect was bad. I found myself strangely placed: under a militia commission to quell a civil strife, the mass of people against me, arms refused by the only authority that could give them, and the Governor under other influences than my own. I believe that night through the instrumentality of that committee I would have brought the Vigilantes to a dead standstill, with absolute submission to the law, or could have so placed them in the wrong that all good and moderate people would have joined us, but these men, Terry, Jones, Baker, etc., had made the Governor believe the committee was caving in, and that he must follow them up rapidly and force them to disband absolutely, to submit unconditionally. If he had the force or backing of the people such a stand would have been right, but at that moment, though he thought otherwise, I was convinced that nine tenths of the people of the State ratified the acts of the Vigilance Committee, but many, a great many, were willing to say they had gone far enough and should stop. General Wool having denied arms, and the Governor having assumed such high grounds against my known advice, I was forced to resign and trust to my motives being understood, and to that end I had published in all the papers Monday morning a letter, of which you will find a copy¹ in the same newspaper slip. . . .

With my resignation all show of resistance ceased here. Nobody but the most active would serve under Volney E. Howard, and the Governor holds out at Sacramento yet, sticking by his proclamation, but he has no person to enforce it, and at this moment the Vigilance Committee has absolute sway in this city. What they

¹ See a copy of the most of this letter in the supplement to the present one (p. 306).—EDITOR.

propose to do, how long their power is to last, or whether they will consent to the courts exercising any power, are questions that no one now asks. All men now hurrah and applaud their wisdom, and even such as Governor Foote, Baillie, Peyton, Mr. Duer, etc., etc., approve all they have done and all they intend to do without being able to answer even, who are they? who appointed them? what are their names? All these are trifles. The committee have published a sort of Declaration of Independence, a constitution. They, over the signature of "33 Secretary" announce their will, and it is bowed to. The preachers applaud their wisdom from the pulpit, although their armed bodies parade the streets on Sundays, and close up any thoroughfare they please by files of armed men. They have a perfect citadel, with cannon above and below, a perfect arsenal of muskets within, and I do not doubt that six thousand armed men will obey their decrees quickly, energetically, and cheerfully. Who are the men who have in a civilized city arranged and organized such a power? Why, very ordinary men. I know most of them, and individually or collectively they are no better than the heterogeneous crowd of which our city is composed. Some of them have been ballot-box stuffers, some of them are rowdies, and more than one is accused of having fled from other countries for forgery or crime. Yet others are good, intelligent, clever, well-meaning men, who are fanatic and believe they are serving their God and their country. . . . Steadily they have organized a power irresistible by any force at the Governor's call, and have wielded that power without violence. I never feared any danger from them as a body, if they could control their men, and my apprehension was that in case I were found to arm my side, a general battle would be drawn on by detached parties, in which event it would have been entirely ruinous to the city. It was this apprehension that made the committee agree to the terms they did.¹ Since my resignation I have purposely kept close to business, have not spoken to either party, and have announced my intention in any row to stand by and defend the Bank. . . .

June 17. I was interrupted so often yesterday that I fear I have not made myself as plain as I could have wished, but I have not the time to amend it now, trusting to your knowledge of men and motives to divine the truth. Governor Johnson is a young man elected by the Know-nothing party, and of a high personal character. When, however, this storm burst upon him his old friends left him, and he was found to ally himself with men who had private griefs to avenge, or who acted from extreme notions.

Few about him were governed by his high, pure principles. He felt as though the honor of his office might be stained whilst in his hands, and he strove to arrest it, but he miscalculated the strength of his adversaries. He is now powerless; for the militia, his only reliance to coerce obedience to his orders, have deserted him in mass, leaving him the naked, unsupported position of governor. Had I been otherwise situated, I might from sympathy have continued to aid him, but by so doing I would have driven off our business, for so high has this feeling run that all business men have yielded to it, and have regarded those who favored the cause of Law and Order as enemies of the people, and withdrawn their patronage from newspapers and all other interests controlled by Law and Order men. I don't think any man in California thinks the worse of me, for our business has not suffered, although I have been known from the first as an opponent of the Vigilance Committee. Though I was accused in the newspapers of threatening to lay the city in ashes, nobody believed it, and the most rabid had to admit that from no act of my life could I be classed as a rowdy or friend of the ballot-box stuffers. What is to be the end of this no one can tell. I fear no violence, but expect the Vigilance Committee will force away their present list of culprits, and then drop back into their business, for the expense of their organization must be heavy, and will as usual fall on a few of the most zealous, who, as soon as their zeal evaporates, will give in. How few the courts will disturb is a doubtful question, and on it may depend the future conduct of the committee.

Affectionately yours,

W. T. SHERMAN.

SUPPLEMENT TO III.

Inclosure (No. 1).

HEADQUARTERS, DEPARTMENT OF THE
PACIFIC,

BENICIA, June 5th, 1856.

To his Excellency J. NEELY JOHNSON,
Governor of California.

SIR: I had the honor to receive last evening your communication of the 4th inst. by Colonel E. A. Rowe.

In reply I would remark that, on examination of the laws of Congress, I find that no person has the authority to grant the request therein presented but the President of the United States. In a recent contest in Kansas Territory, somewhat analogous to that which you state exists in the city of San Francisco, on application, I believe, of the governor of the Territory for arms and ammunition to aid in suppressing it, the President refused to grant them.

¹ That is, to the terms carried by the "conciliation" committee to the Governor.—EDITOR.

Under these circumstances I am constrained to decline granting your requisition.

I am, very respectfully,

Your obedient servant,

JOHN E. WOOL, Major-General.

Inclosure (No. 2).

SAN FRANCISCO, June 6, 1856.

GENERAL JOHN E. WOOL, United States

Army, Commander Pacific Division, Benicia.

MY DEAR GENERAL: I was surprised beyond measure to hear yesterday from Colonel Rowe, who brought me a copy of Governor Johnson's letter to you of June 4, that you expressed a determination not to risk the issuance of arms to the militia of this State, under the present aspect of things.

After your assent to the Governor's request in my presence to issue such arms as would be required in the present emergency I cannot think that Colonel Rowe could have got the exact meaning of your reply.

Governor Johnson has issued a proclamation and I have issued orders for the enrollment of the militia. And already several companies have reported, and many more are known to be progressing in the work. Now if we cannot count on getting arms and ammunition as a certainty I should know it as soon as possible. I assure you on my honor that I will not call for a musket or a cartridge till I am dead certain that the arming the militia will at once restore authority to its legitimate channels. If the number of men or if the character of the men who offer their services are such as I am not willing to command, I will not receive their service.

But I think, my dear General, I should know at once—to-night if possible—by the Stockton Boat, whether in case I call for arms I can have them.

Your friend and servant,

W. T. SHERMAN,

Major-General, California Militia.

GENERAL SHERMAN'S CARD TO THE PUBLIC
ON RESIGNING HIS COMMISSION.

[The "San Francisco Evening Bulletin" of June 9, 1856, contains in its news columns what appears to be the most of this card, which it apparently does not publish entire. What is given reads: "I think I have already said and done enough to convince all that I am not an advocate of the Vigilance Committee; and whilst I would have contributed my assistance to expel from our midst all rowdies, ballot-box stuffers, and shoulder-strikers, it would only be by the application of some legal mode, which I believe does exist, and not by resorting to the organization of a committee, which in the enforcement of its decrees has been compelled to resist the sworn officers of the law.

"When, however, the Vigilance Committee had become installed in power, and I had received the orders of the Governor to organize the militia to aid the sheriff in the execution of his duty, I did my best to influence and command all good citizens to enroll themselves into companies, promising when a sufficient number were enlisted, provided the necessity still continued, to arm, equip, and muster them into the service of the State. I based my promise of arming the enrolled militia on a verbal assurance, given to Governor Johnson by General Wool, in my presence, to issue from the United States Arsenal, on a proper requisition, such arms and munitions of war as the emergency might call for. It is now no longer a secret that when the written requisition was made, General Wool had changed his mind, and had discovered that he had not the legal power to grant the request.

"I have at all times endeavored to calm the public excitement; I have counseled moderation and forbearance, but I was forced to conclude that these moderate counsels did not coincide with the views of Governor Johnson, and, in justice to him, I felt bound to afford him the opportunity to select some representative here whose ideas were more consonant with his own."

COMMENTS ON III.

THE controversy with Wool about the broken promise of aid continued for a good while. The Executive Documents above cited contain much correspondence bearing on the matter. Wool's position is sufficiently indicated by his letters referred to in a foregoing note.

To explain the warmth of feeling which the subsequent letters of this correspondence will show, it is well to point out, as an added motive from this time on, that the Vigilance newspapers, in the first week in June, contain very violent assaults upon Sherman. His proclamation calling for volunteers was burlesqued in the "Alta." "Bulletin" correspondents called him a "traitor" and his volunteers "mercenary hirelings," and much more of the sort appeared. Side by side with such attacks there are beseeching appeals to him as a man and a friend to come out from amongst such evil associates, and the "Bulletin" congratulates him warmly when he resigns; whilst he cheerily says, in the foregoing letter, that he believes that no man thinks the worse of him after all, yet these things wore on Sherman's patience, and the sense of failure was henceforth present.—EDITOR.]

IV.

BANKING HOUSE OF LUCAS, TURNER & Co.,
SAN FRANCISCO, July 2, 1856.

DEAR TURNER:

The last advices explained the condition of public affairs up to the 20th ult., at which time the Vigilance Committee were in full blast. There was an apparent submission to them

which looked like a perfect calm, but every thinking man knew that at any moment the whole might explode. Sure enough, on Saturday the 21st, occurred one of the most disgraceful scenes that can be imagined. It seems that General Howard, who succeeded me in the management of the military affairs here, was gathering arms and munitions, picking them up wherever they could be found. A small schooner, the *Julia*, had about one hundred and thirty muskets on board, and whilst on her way to the city was intercepted by another small vessel with Vigilance Committee men on board, headed by one Durkee, who took the arms and the three men in charge in custody, and on reaching the city the arms were taken to the fort of the committee, and the three men turned loose; these were named Phillips, Maloney, and McNab. These men went before the United States District Court and filed a complaint against Durkee for a piracy on the waters of the bay, and the committee, finding themselves about to be embroiled with the United States Government, discovered that Maloney was a bad character, a ballot-box stuffer, and accordingly issued their orders for his arrest. This order was placed in the hand of . . . Hopkins, who proceeded to the room of R. P. Ashe, navy agent—brother-in-law of Dr. Moses in your city. He has been a most violent opposer of the Vigilance Committee, and was captain of one of the companies enrolled under my orders.

His room is over Palmer, Cook & Co's bank, and Judge Terry of the Supreme Court was staying with him. Terry too is a most violent opposer of the committee, is the judge whose will was disobeyed, and who has honestly opposed the progress of the committee by all the influence he possesses. When Hopkins reached the room and asked Maloney to go with him, Ashe, Terry, and others present put Hopkins out. He immediately sent word to the committee-rooms for more force to arrest Maloney. Ashe, Terry, and others in the room with Maloney took such weapons as they could get, and started for one of the armories used by one of the State Volunteer Companies, on Jackson street, between Kearny and Dupont. On leaving Palmer, Cook & Co's buildings, they were followed by Hopkins and others, who endeavored to seize Maloney, but Ashe and Terry interposed, and they had nearly reached the armory, when Hopkins seized the gun in Terry's hands, a scuffle ensued, a pistol went off, and Terry, a strong fine-looking man, excited, announced himself a judge of the Supreme Court, commanded the peace, and endeavored to escape from Hopkins, who held his gun with his left hand, and with his right grasped Terry by the hair or neckcloth. Then Terry drew his

knife, showed it to Hopkins, and stabbed him in his left shoulder. Hopkins by this time had Terry's gun, with which he ran down the street, crying he was stabbed (or killed). Maloney, Terry, Ashe, and party thus reached the armory, which is in the third story of a fire-engine house. Then arose such a tumult as I never witnessed. The Vigilance bell pealed forth its wildest clamor, and men ran, calling, "Hang him! hang him!" All kinds of stories flew about that Terry had shot Hopkins dead, and indeed it was hours before the truth was known; all stores were closed; so wild was the tumult that I had the money put in the vault and locked, and commanded all the clerks to stand by. Crowds of people with muskets, and swords, and pistols poured by up Jackson street, and a dense mass of men filled the street from Montgomery to Stockton. Knowing Terry and Ashe to be desperate men, and hearing that about fifteen or twenty of their friends were with them, I took it for granted that blood would be shed; but after some talking they concluded to surrender, and were conducted under strong guard to the Vigilance Committee rooms. At the same time all the armories of the State Volunteers were surrendered, giving up their arms and accoutrements—a regular *coup d'état à la Louis Napoléon*. Thus from that day the State of California ceased to have any power to protect men here in defense of her sovereignty. . . . Since that day nothing has been done in the military way, except by the Vigilance Committee, who have their rooms fortified, and whose companies are marched through the streets at all hours. Some are being uniformed, and some bands of music are now being formed, so it may be they intend to keep up their military power a long time. In the mean time Terry is in the cells of the committee. At first they were disposed to treat him well, allowed his wife to see him, but of late they have changed, and now they permit no one to visit him. I inclose you a slip containing a letter from Mrs. Terry, and I know you will agree with me that this is a case of such cruelty that, without knowing, we could not believe such a thing could be enacted in an American city. For ten days Hopkins has been lying on his bed, with reports coming every hour that he was getting worse and even dying. The newspapers have been inflaming the public mind, and that "Bulletin," the cause of all this civil strife, announces its dictates, which are promptly obeyed. To it Judge Terry is indebted for the cruelty shown him. When it was generally understood that during his confinement he was to have a room and be allowed the company of his wife, the "Bulletin" announced that such would not be the case; and that the editor was *happy* to an-

nounce that Judge Terry would not be treated a bit better than Casey and Cora; that he was confined in the same kind of cell; that he would be tried by the same law; and, if found guilty, suffer the same penalty. It has now been acknowledged that if Hopkins died, Judge Terry would be hung; if Hopkins recovers, then he will be banished. At all events he must be made to resign; but he will not resign, he says; he would rather die than be dishonored. He was imprudent in this matter, for as judge he ought to have kept aloof on the score that the questions involved might come before him as judge. So satisfied was I of this that, when in command here, I requested Johnson to call him to Sacramento, which he did; but when I resigned he came again to the city, and the result is he is in the power of the committee. . . . I hope Hopkins may recover, in which case the committee can do nothing to Terry; but if he die we may have further commotion. I am sick of this whole matter, and I believe the community is fast becoming so, and therefore I will drop the subject, leaving the newspapers to keep you advised of the progress of this singular revolution. I am out of it, and believe that I have lost nothing in public estimation in what I did; at all events it is a lesson I will never forget—to mind my own business in all time to come.

Your friend,

W. T. SHERMAN.

TO HENRY S. TURNER,
ST. LOUIS, MISSOURI.

BANKING HOUSE OF LUCAS, TURNER & Co.,
SAN FRANCISCO, CAL., July 7, 1856.

MY DEAR BROTHER: The steamer sails to-day and will bring you news of the same character as the two past. The Vigilance Committee is in full blast, still exercising full control; has Judge Terry in their power, and, had the man Hopkins died, they would have hung him. Now the probabilities are they will send him away. Where the matter is to end I cannot imagine; but I think the community is getting sick and disgusted with their secrecy, their street forts and parades, and mock trials—worse, far worse, than the prompt, rapid executions of a mob or lynch court. Since my resolution I have kept purposely aloof from all parties, either one way or the other. Being in a business where large interests are at stake, I cannot act with that decision that would otherwise suit me. I do not think that there is any necessity for the interference of the Federal authorities, but that before we can hear from Washington the matter will be over and forgotten. . . .

Your affectionate brother,

W. T. SHERMAN.

BANKING HOUSE OF LUCAS, TURNER & Co.,
SAN FRANCISCO, CAL., August 3, 1856.

MY DEAR BROTHER:

Here in this country the democratic, common element prevails to such a degree that, as you will have observed, the influence of the Governor, Mayor, and all the executive authority has been utterly disregarded. For three months we have been governed by a self-constituted committee, who have hung four men, banished some twenty others, arrested, imprisoned, and ironed many men, and who now hold a judge of the Supreme Court in their power, the authorities being utterly unable to do anything. . . . There is no doubt we have had a bad administration of law here, and more than a fair share of rowdies; but I think the committee itself no better, and if we are to be governed by the mere opinion of the committee, and not by officers of our own choice, I would prefer at once to have a dictator. The committee is now in a bad fix. The man whom Terry stabbed is well. The Executive Committee of Vigilance are willing to acquit him; but before they can act in such a matter, by their by-laws they must submit the case to a Board of Delegates, composed of three (3) from each of their military companies. This Board of Delegates, of course, want action, and they insist that Terry shall resign his office and go away or be hung. There is a sloop of war here, the *John Adams*, whose commander says that he will intercept any ship that attempts to carry Terry off. So that it will be difficult for them to banish Terry, and it is not impossible that they may yet hang Terry to save themselves the consequences of his return to the bench. If there is not an entire revolution and withdrawal from the Union, then all these acts of violence must come up before our courts on action for civil damage; and it is likely if Terry returns to the bench he will have some feeling against the men who have kept him imprisoned for some two months with daily expectation of death or banishment. We are waiting to hear what President Pierce will do in this matter. I doubt if he will interfere as long as the trouble is local, and as long as those men do not try to bring about an absolute revolution, which I do not think they have yet contemplated. My own opinion is the committee is tired of its position, but finds it difficult to withdraw from the complications in which they are involved.

Affectionately your brother,

W. T. SHERMAN.

[We may close the correspondence with an extract from one later letter, written a short time after Terry's discharge and the final parade.—EDITOR.]

EXTRACT FROM A LETTER OF AUGUST 19.

It is pretty generally acceded to that Terry's friends in the committee had to log-roll and stuff the box in order to save him. I know that some of the most conservative of that committee hurried Terry aboard the *John Adams* at two o'clock at night to save him from

the vengeance of the more rabid faction. The committee yesterday had a grand jubilee, and for the time being are retired from the public gaze, but nobody can doubt that in any case of danger to themselves they will again come on the tapis.

Your affectionate brother,
W. T. SHERMAN.

TOPICS OF THE TIME.

The Christmas Century.

FOR the first time in many years THE CENTURY greets its readers with a regular old-fashioned Christmas number — with a difference. The difference may be felt in the absence of some of the approved conventionalities; but the Christmas quality, we think, will also be felt here and there throughout the number both in illustrations and text — sometimes ostensibly and objectively, sometimes subtly enough.

As one grows older in this world of realities, one begins to stiffen the back against the sentimental. True sentiment is upheld with force and arms against sentimentalism. As one grows older, still, in this world of realities, the back does not always so quickly stiffen even against the sentimental — even against the sentimental Christmas, even against the sentimental Christmas number. The present can hardly be said to be the "sentimental Christmas number"; but if the Christmas reader finds in it, and is pleased to find, a goodly share of the true Christmas sentiment, how well content will be those who shall have — then successfully — gathered together the art and literature of the CHRISTMAS CENTURY!

Charitable Reform of High Public Value.

THE State Charities Aid Association, which has done so much during the last nineteen years to improve the condition of the inmates of poorhouses, almshouses, and other charitable institutions in the State of New York, is engaged in several new movements, all of which are most commendable, and two of which are of such vital importance that we wish to call special attention to them. Surely no time more fit could be chosen in which to speak of the humane work of this Association than the Christmas season.

Let us say at the outset that it is to the organization mentioned that the State owes the passage of the humane and most desirable law transferring the pauper insane from the county poorhouses to the State institutions provided for such patients. This was merely the culminating reform in a long series, beginning in 1872, when the Association was formed, and including such notable achievements as the initiation of tenement-house reform, the establishment of the first working-girls' clubs, and the establishment of municipal lodging-houses, all in New York City, and the establishment of temporary homes in Ulster, Westchester, and Queens counties. It should be borne in mind that the Associ-

ation is a voluntary body, and is supported entirely in its work by voluntary contributions. In other words, it is a body of humane men and women who have voluntarily given their time and energies to the task of making more comfortable the lives of the most helpless of their fellow beings, relying entirely upon the sympathetic aid of other humane men and women to defray the pecuniary expense of their labors.

It is to an association of this high and unselfish character that we call the attention of THE CENTURY'S readers, in the hope that needed assistance may thereby be encouraged from many quarters. The first of the two objects of the Association upon which we wish to dwell especially is the establishment of a State institution for epileptics and their removal from the poorhouses and almshouses. There are at present about five hundred such patients in the county and city institutions, in which there is for them no special medical treatment, little employment, and no training or education. Under such conditions of neglect and idleness the result is almost inevitably to make the victims of the disease permanent paupers. Under skilled medical treatment it cannot be questioned that some of them might be restored to health, and others might be so far benefited that they could be restored to their homes or friends. Many of them, either because of their infirmity or lack of training, have no occupation, and are unfitted to compete with able-bodied laborers in case they are discharged from the almshouses. If they were taught some useful calling while in them, their prospects for making their own way in the world, and leading happy and useful lives, after leaving the institutions would be greatly brightened.

The epileptics are almost the only defective class for whom society has made no especial provision. In an earnest plea for separate asylums for them which Dr. Frederic Peterson, a high authority on nervous and mental diseases, made a few years ago, he said:

The sufferer from epilepsy has been left to shift for himself, often an outcast from his family, usually expelled from the schools, denied industrial employment, shunned to a great extent by his fellows, left to grow up in ignorance and idleness, companionless and friendless, a prey to one of the most dreadful and hopeless of maladies, refused admission to general hospitals, and only at last given refuge in either an almshouse or insane asylum.

He is driven to find shelter in an asylum, not, as a rule, because he is deprived of reason, but because there is no other place for him to go. There are thousands of epileptics in insane asylums to-day who do not belong there, for many will be found among them who are not

insane, and it is an injustice to them, as well as a detriment to the insane, to associate the two classes.

When we take into consideration the fact that a large majority of these unfortunates are gifted with as much intelligence as ordinary human beings, that they are as capable of education, as well adapted for every-day pursuits, quite as able to be self-supporting as most people, the unutterable woes of this class become more apparent. But the conditions under which they may secure their proper mental development and their need of occupation must be such as combine medical supervision with wise industrial teaching and training.

Foreign countries have been far ahead of America in extending kindly and sympathetic aid to these unfortunate fellow creatures. Twenty-five years ago a colony for epileptics was established at Bielefeld, near Hanover, in Germany, by Von Bodelschwingh. "It seemed to its benevolent founder," says Dr. Peterson, "that it was feasible to create a refuge where such sufferers might be cured if curable; where their disease might be ameliorated, their intellectual decay prevented; where they might find a comfortable home if recovery were impossible; where they might develop their mental faculties to the utmost; might acquire trades or engage in any occupation they saw fit to choose; finally, to grow into a community of educated, useful, industrious, prosperous, and contented citizens." These ideas have been completely realized. The colony has expanded until it has over one thousand inhabitants, covers more than three hundred and twenty acres of beautiful woodland and meadow, has over sixty houses and cottages, surrounded by pretty gardens, excellent schools, shops of all kinds for selling and manufacturing the necessities of life—in fact, is a village in all respects like to those of the more fortunate of God's people. Taking this colony as a model, nine others for epileptics have been established in Germany, one in Holland, one in Switzerland, and one in France, all of which are successful. The first of the kind in this country has recently been established in Ohio by the State. Surely New York and other States ought to follow in the good work at the earliest possible day.

The second of the objects to which the Association is bending its energies, and to which we most earnestly beg the attention of our readers, is the enactment of a law which will authorize a better system of commitments to the New York City Workhouse. A bill for this purpose was presented to the legislature last winter, but it did not become a law, though it had the support of all the charitable organizations in the city. The present system could scarcely be worse had it been designed especially to encourage and spread vice and crime. It sends chronic offenders over and over again on short sentences, which are often still further shortened by the committing magistrate in compliance with an order from a single Commissioner of Charities and Corrections. A former matron of the workhouse says of the influence of this system: "The workhouse has been since the first day of opening, and is now, but a place of recruit and a vantage-ground for a perfectly dissolute life. The daily changing element, the ten-day women, keep the links of information open between it and the haunts of vice in the city." The same thing is true of the men. As the Association said in a circular issued on this subject last spring: "It is an outrage against the unfortunate and young in vice that they should be forced into association with the criminal and vicious; it is an outrage against the community that

these old offenders should be allowed to spend their lives vibrating between the workhouse and these places of vice. Instead of being a moral quarantine, the workhouse is a place where contagion is nurtured and from which it is spread."

This is inevitable from the nature of the system. The constant entry and departure of chronic offenders brings about a perpetual changing in the population of the workhouse, which not only prevents all exercise of reformatory influences, but makes moral contamination easy and certain. Classification of a number of men or women who are in for only a few days is impossible. Over one half of all commitments are for ten days or less. A former warden says, with obvious truth, that "for many of the inmates a trip to the Island loses all terrors, and comes to be regarded as a rather pleasant diversion, giving them an opportunity to get thoroughly clean, a needed rest after a prolonged spree, and excellent medical attention." Statistics show that about 4000 persons were arrested, tried, and committed 10,000 times to the workhouse in 1887. As to commitments, the statistics show that about seventy per cent. of the women and forty per cent. of the men each year have been previously committed to the workhouse; 5895 women sentenced to the workhouse during the last six months of 1888 had aggregated since the beginning of the previous year (that is, twenty-four months) 23,126 sentences, an average of four apiece. One woman served twenty-eight sentences in twenty-five months, twenty out of the number being for ten days or less.

This is an outrageous condition of affairs, to be found in a civilized community, and when we consider that the system described is in full operation, not in a small community, but in the largest city in the land, the imperative need of the reform becomes manifest. Last year's reform measure proposed a regulation sentence of six months for every case of intoxication, disorderly conduct, or vagrancy, and gave the Commissioners of Charities and Correction power to shorten the term in accordance with the record of the offender. A similar measure will be introduced again this winter, and it ought to be passed without opposition. It ought to be obvious to every intelligent mind that a vice-breeding and vice-spreading institution of this kind in the largest city in the country, a city to which the worst criminals drift as offering the most favorable field for their operations, is not only a disgrace to our Christian civilization but a peril to the well-being of the entire land.

We have selected these two from the list of the reforms proposed by the State Charities Aid Association, not because they were more deserving than the others, but because they seemed best calculated to attract public attention to the invaluable work in the cause of humanity which this excellent organization is doing. It is a work for the helpless and for the victims of criminal associations, and as such it commands very little popular sympathy, most people declining to take any interest in the work of improving the condition of portions of the population who are disagreeable for them to contemplate. For this reason, if for no other, the unselfish efforts of the members of the Association are worthy of the highest praise. There are, we are glad to believe, not lacking in this country, as in others, people who appreciate both the high importance of the work and the noble self-sacrifice of those who are

pushing it forward. We hope that many of our readers, as they contemplate this work, will take to heart the following impressive words, uttered by Bishop Potter at the public meeting of the Association which was held in Chickering Hall last May:

The post of mere observation in connection with charitable reform, if it goes no further, is a very dangerous position. As Bishop Butler, in substance, says, "Passive impressions, constantly repeated, unless they pass over into action, cease at last to touch the conscience or the will." It is a profound truth which no man or woman, in the midst of a Christian civilization like ours, threatened in so many ways, can afford to forget. You and I, my friends, must take the quickened feeling with which we have heard of this heroic work to-night, must be touched and moved by the fine examples of these men and women who, disdaining misapprehension and misrepresentation, without fee or reward, working always and everywhere without that stimulus of the large sympathy, of the more active and emotional sentiment of the community, have held on through all these years with such a fine courage, never losing their faith in the worth of their work, and making that work all the time larger and nobler and more real to every honest man or woman who looked at it.

All persons interested in the objects and work of the association can obtain its documents and other information by addressing Mr. Charles S. Fairchild, treasurer, 21 University Place, New York City.

The "Per Capita" Delusion.

THE *per capita* argument has always been a favorite method for sustaining a demand for cheap money. Such demands invariably arise when times are hard, that is, when money is scarce. The cheap-money advocates, acting on the knowledge that a great many people are wishing that they had more money in their pockets, come forward with the explanation that the real cause of the trouble is the smallness of the monetary circulation, the volume of currency not being adequate for the demands of the business of the country. They point to other countries, like England, Germany, and France, saying that they have a much larger per capita circulation than the United States, and claim that everybody in this country would have more money in his pocket if a great addition of some form of cheap money—either irredeemable paper, or depreciated silver, or sub-treasury notes—were made to the currency.

The fundamental defect in the argument is that it confounds small circulation with small distribution. The trouble is not that the circulation is small, but that so many people fail to get much of it. If the circulation were to be doubled, or trebled, or quadrupled, what reason is there for believing that the people who have least at present would have any more? *How would they go to work to get some of the increase into their pockets?* This, as we said many months ago in one of our earlier articles in this cheap-money series, is the crucial question in all schemes for making money cheap and plentiful. How can a man who wants some of it obtain it except he give labor or goods in return for it? If he have labor or goods to sell, does it make any difference to him whether the volume of currency be large or small? Is it not always large enough to furnish payment for what he has to sell? And if he has anything to sell, would not he rather receive his payment in dear money than in cheap money? Was

there ever a man yet who did not desire to be paid for his wares in the soundest and best money obtainable? Who are the men who hope, in some mysterious manner, to get money into their pockets through a great issue of cheap money by the Government? Are they not, almost invariably, men who have nothing to sell in exchange for it?

It is difficult to see why the per capita argument should influence any one who thinks about it carefully. When we say that the wealth of the country, if divided equally among all its inhabitants, would be so many dollars per capita, nobody is seriously disturbed by the fact. Nobody says that there is not wealth enough in the country. The most usual observation is that it is a pity it cannot be more evenly distributed. But when the statement is made that the circulation is only \$23 per capita, many people are inclined to think that this is not enough, and that if we had more everybody would be in more comfortable circumstances. But would everybody get some of the increase in his pocket? If not, what would be the advantage? If the wealth of the country were to be doubled, where would the increase go? The greater part of it would go to the millionaires and other rich people who have most at present, while the people who have least would get little or none of it. So it would be with an increase of circulating medium. If the per capita were to be doubled, the ratio of the present division would be maintained. The people who had the most before would get the most of the increase, while those who had none before would get none now. The great want of the people who have none is not an increase in the volume of currency, but the discovery of a new method by which they can get some of the currency already in circulation into their pockets.

Statistics published lately by the Treasury Department demonstrate conclusively the fallacy of the per capita argument. These give the per capita circulation for each year from 1860 down to the present time, and show that there has been a steady rise from \$17.50 in 1870 to \$23.45 in 1891. If prosperity is determined by per capita, this country ought to be vastly better off in 1890-91 than it was in 1870, but, as a matter of fact, 1870 was one of the most prosperous years the country has ever known, while 1890 and 1891 will be known in history as years of almost unequalled financial and industrial depression. All through the years since 1878 we have been swelling the volume of currency by coining silver and gold to the amount of \$945,000,000, and have been issuing many millions more of silver notes and gold notes, till we have now a circulation of over \$1,500,000,000 against only a little more than \$655,000,000 in 1870.

Those persons who were complaining a few months ago, when money was scarce, that even this immense volume of currency was insufficient for the business needs of the country, and that if we had a larger circulation per capita there would be no such scarcity, were laboring under a misapprehension. They were confounding contraction of the currency with contraction of credit. Ninety-two per cent. of all the business of the country is done on credit, and only eight per cent. with actual currency. When, therefore, credit is unsettled, as it was by the impending peril of free-silver coinage, which would have lowered the standard of value as well as destroyed its stability, instantly a

serious monetary contraction was felt throughout all the avenues of trade. Instead of the trouble being one which an issue of cheap money would have remedied, it was one which owed its existence entirely to the mere threat of such issue. As soon as the threatened danger was averted, the stringency disappeared, and there has been no complaint heard since about a scarcity of money, either for "moving the crops" or for anything else.

Suppose now that free coinage of silver were to be authorized, what would be the effect upon the circulation? It is estimated that \$12,000,000 would be the extreme amount that it could add to the circulation. If the increase of nearly a billion since 1870 has not helped us, would twelve millions do it? And if we were to have free coinage, into whose pockets would the increase go? Not into those of the people, but into those of the men who sold the silver to the Government at a price greater than it would be worth as money after being coined. Those men would not put it into the pockets of the people, but would add it to their own wealth, and the only benefit the people would derive would be the opportunity to pay off their debts in a cheaper money than that in which they were incurred, provided they were able to get some of it in return for labor or goods.

Per capita arguments from foreign countries are all misleading. Nobody can tell what the per capita circulation of Germany, France, and England is, because those countries have a metallic circulation of large and unknown volume, with no small bank-notes like ours. The systems in all these countries are so different from ours that intelligible comparison is out of the question.

If size of per capita circulation determines prosperity, how does it happen that the Argentine Republic, with a per capita of over one hundred dollars, is in such financial, commercial, and industrial collapse? How did it happen that repeated additions to its volume of currency did not check its downward march to ruin?

The delusion behind the per capita argument is the same one that is behind all cheap-money panaceas. It is a belief, not always clearly defined, that a large issue of money by the Government will carry with it in some mysterious way an instrumentality for getting some of that money into the pockets of the people without the people giving anything in return for it. It is based on the idea that the Government can *create* money, and is a perfectly logical deduction from that idea, for if the Government can create money, there is no reason why it should not distribute it freely among the people. In fact, if the Government can create money, and by its own edict maintain it in circulation as good as any other money, *why should the Government levy taxes?* This question has been asked before, but we have never seen or heard an answer to it. If the Government can take 75 cents' worth of silver, and by declaring it to be a dollar make it worth 100 cents, why should it not do the same with 50 cents' worth, or 10 cents' worth, or with a piece of paper? And having done this, having by its fiat made a piece of paper worth a dollar, why, we ask again, should it not abolish taxation and support itself with the money of its own creation? If it were to do that it would give us a per capita circulation greater than any the world has yet seen.

The World's Columbian Exhibition.

THE World's Fair at Chicago in 1893, in commemoration of the discovery of America by Columbus, has long since passed the experimental and critical stage of its development. Ample assurance is now given that it will be not only one of the most comprehensive and complete international exhibitions ever organized, but will surpass all predecessors in the architectural beauty and extent of its buildings and the natural charm of its location. It will be an exhibition worthy of the United States and of the closing years of the nineteenth century.

It is not our purpose in this article to enter into a detailed description of the proposed buildings and their surroundings, but to give in as concise a manner as possible a statement of what has been accomplished in the work of organization up to the present time. Our desire is to show the readers of *THE CENTURY* that the country is going to have an exhibition which, instead of being local, or Western, or national, will be international in the largest sense of the term, and will be a demonstration of the country's first century of development that will be viewed with just pride by every American. Not only will the nations of the Old World take part in it, but eighteen sister republics and various colonies of the New World which Columbus discovered will be represented. Nearly or quite all of these have officially accepted invitations to send exhibits. A large number of them will have buildings of their own, many having already given notification to that effect.

The amount of money which is likely to be expended will be far in excess of what has hitherto been used in any similar display, and will help, perhaps better than detailed description, to convey an idea of the magnitude of the exhibition. Chicago is to provide \$10,000,000. It is believed by the managers that the other parts of the country will contribute for their State and Territorial displays at least \$5,000,000. The nations of the Old World, it is believed, will expend a grand total of at least \$10,000,000. Japan alone has appropriated \$500,000, and Germany \$250,000. The Central and South American republics and colonies, with Canada, will expend several millions more, and the grand total which will go into the exhibition from all the participants is placed by the managers at nearly or quite \$40,000,000. The Local Directory and the National Commission estimate the amount to be expended upon buildings and surroundings, under their immediate control, at \$18,000,000. This is more than double the amount expended for the same purposes at Philadelphia in 1876, and more than three times that at Paris in 1889.

No exhibition that has ever been held has had a site of such great natural attractiveness as that which has been selected in Chicago, and when it shall have been occupied by its buildings and its natural advantages developed to meet the demands of the occasion, we think it can safely be said that it will be the most superb setting ever given to such a purpose. The space is far larger than that of other exhibitions, comprising about 1000 acres, with a frontage of two miles on Lake Michigan. The Philadelphia exhibition grounds comprised 236 acres, and those of Paris 173. The buildings will be grouped upon the lake front, and flowing between them will be a system of canals and lagoons, from 100 to 300 feet in width, which will add greatly

to the picturesque appearance of the exhibition. This system will connect the small lakes already in Jackson Park, which forms the site, with Lake Michigan, and over this waterway, which will be a circuit of three miles in length, many bridges will be thrown. It will flow around a wooded island twenty or thirty acres in size, and down to its edges will slope broad grassy terraces leading from the principal buildings. The canals will connect with Lake Michigan at two points. At the southern point of the site, where the great main building is to stand, upon a jutting strip of land which runs 1200 feet into the lake, piers will be constructed, at which passengers can be landed from the steamers. Within the lines of these piers will be formed a wide harbor in which pleasure-boats of all descriptions and nationalities, used for carrying passengers about in the canals from one building to another, can lie.

There will be no fewer than twelve great buildings, all designed by American architects of high rank, and exceeding in beauty as well as in extent anything of the kind ever seen in this country. The estimated cost of these, with their names, is given in the following table :

Administration	\$450,000
Manufactures	1,000,000
Agriculture	540,000
Machinery Hall	1,200,000
Electricity	375,000
Mines and Mining	260,000
Transportation	280,000
Horticulture	300,000
Fish and Fisheries	200,000
Woman's Building	120,000
Casino and Pier	150,000
Art Palace	500,000

Work on these buildings is already well under way, and by the time the new year arrives several of them will be under roof. The prevailing style of architecture is Italian Renaissance. In addition to wood, iron, and glass, there will be used in the construction of some of the buildings a kind of cement, or concrete, which will give an appearance of solidity, as well as a beauty of outline and color, quite unprecedented in structures of this kind.

Every effort will be made to secure in all departments of the exhibition the best expert service and the most complete displays possible. Especially it is believed that the electrical, art, and woman's departments will surpass all previous manifestations. All these will have magnificent buildings, and their displays will be in charge of people who have the highest qualifications for their work.

The time has more than come when all parts of the country should join hands to help the managers of the Fair, who have shown such energy and intelligence in its organization, to carry the enterprise to the full success which it merits. Those States, including New York, which have been backward in making their appropriations for exhibits, should not delay a moment after their legislatures meet in January to take action in the matter.

Chicago has shown that she possesses the public spirit necessary to give the Fair the widest international character and dignity, and we are confident that other parts of the country will not be found lacking in the same patriotic quality.

OPEN LETTERS.

John Boyle O'Reilly as a Poet of Humanity.

WHILE it is an excellent thing to apply our most exacting standards even to those writers, painters, architects, or sculptors of our time who are accomplishing what we believe to be the best work of their period or place, we ought to be quite as careful to perceive their special merit clearly and to give it cordial praise. On the same principle, when we find a strong, uncommon mind expressing itself perhaps with many imperfections, yet with singular force and sincerity, and with bursts of something akin to inspiration, it is wise to hold severe technical judgment in abeyance for a moment, in order to extract by sympathetic appreciation the largest measure of sterling value. In the first case, admitting a genius of commanding power and skill which easily makes malleable gold of its material, we may perhaps demand that he should have wrought it into still better form. In the second case we are examining the rough quartz, and our main business then is to appraise at its full worth the precious metal, only traces of which glitter in sight. John Boyle O'Reilly, regarded as a poet, must perhaps come under the quartz category, for much of his verse was written in haste and with a partial crudity due to the conditions. But there were occasions when, by the assay of strong emotion,

combined with his fine intellectual energy and the glow of a shaping imagination, he was able to separate the more valuable substance from its rock-bed in abundant purity.

As an artist in verse he too often fell short; yet the very marked increase of dexterity and delicacy in some of his later pieces demonstrated how well fitted he was by nature to rise to the higher plane of expression. His influence as a writer and as a man was very wide, not only among classes usually little affected by artistic literature, but also among many cultivated, refined, and sensitive minds. Yet his following was largely personal; and there is some danger that his influence, on this account, may pass quickly, or never be felt by those who did not know what he was. It is not of the artist in him, nor of his personality, that I wish here to speak particularly. It is rather the great, human, altruistic principle and sentiment for which he stood,—his impassioned conviction of human brotherhood, his desire to spread generous, unselfish maxims and ideals of manly, magnanimous thought and conduct,—which ought to be emphasized. For although there was not the slightest obscurity in what he wrote, literary people and the general public seem to be somewhat impervious to the fine, warm, noble spirit to which he so eloquently gave voice, often in such ringing music.

Quite early, in his first volume, he admitted that :

From soul to soul the shortest line
At best will bended be:
The ship that holds the straightest course
Still sails the convex sea.

But he persisted in enforcing the principle that if, at best, men find it hard in the nature of things to deal directly, and to understand each other fully, all the more reason is there for maintaining the highest standards, fostering the most humane, the tenderest, and most patient sympathies.

Steer straight as the wind will allow; but be ready
To veer just a point to let travelers pass:
Each sees his own star — a stiff course is too steady
When this one to meeting goes, that one to mass.

In writing of the clash of two Irish brigades — one Federal, the other Confederate — “At Fredericksburg,” he announced, praising both equally :

Who loveth the flag is a man and a brother,
No matter what birth or what race or what creed.

And, in “Resurgite,” he said :

Earth for the people — their laws their own —
An equal race for all:
Though shattered and few, who to this are true
Shall flourish, the more they fall.

One of the most striking of his earlier pieces was “The Trial of the Gods,” based on the episode of the Roman Senate voting to dethrone Jupiter in favor of Christ; and after describing that episode, he applied the moral to present times, when, although we still give victims to Mars, and sacrifice to Venus, and honor Mercury, and Bacchus is not dead, still

We know the Truth; but falsehood
With our lives is so invow —
Our Senates vote down Jesus
As old Rome degraded Jove!

Such plain speaking as this is by no means always welcome. But if the reproaches, the appeals, and the warnings constantly uttered from our pulpits to counteract the evils of existing civilization be justified; if the efforts of thinkers, scholars, humanitarians to evolve higher and more unselfish forms of social action be warranted — then O'Reilly's earnest sarcasms and trenchant condemnations may be not merely pardoned, but also heeded. To him Christ was real, and should be realized to-day by the complete embodiment in society and law of those great and tender principles which, nominally accepted, have not been truly carried out. Later, he returned to this theme in “Prometheus — Christ,” exclaiming :

O dumb Darkness, why
Have always men, with loving hearts themselves,
Made devils of their gods?

And then he says :

Christ walks with us to hourly crucifixion.

Justice ? The selfish only can succeed :
Success means power — did Christ mean it so ?

Mercy ? Behold it in the reeking slums
That grow like cancers from the palace wall.

But he finds hope in the truth that between us and the Darkness stand two forms, each “crowned eternally.” One, wearing flowers and tender leaves, is Nature, smiling benignly;

and the other One,
With sadly pitying eyes, is crowned with thorns.
O Nature, and O Christ, for men to love
And seek and live by — Thine the dual reign,
The health and hope and happiness of men!

Him we must follow to the great Commune,
Reading his book of nature, growing wise
As planet-men, who own the earth, and pass.
Him we must follow till foul cant and caste
Die like disease, and Mankind, freed at last,
Tramples the complex life and laws and limits
That stand between all living things and Freedom!

There is a touch here of Shelley's enthusiasm for actual universal freedom; but it is a Shelley devout, religious, well balanced. Doubtless it was very shocking to some readers that O'Reilly should cry out, in his powerful poem, “The City Streets,” —

Take heed of your Progress! Its feet have trod on the souls it
slew with its own pollutions;
Submission is good; but the order of God may flame the torch of
the revolutions!
Take heed, for your Juggernaut pushes hard: God holds the doom
that its day completes;
It will dawn like a fire, when the track is barred by a barricade in
the city streets.

And it could be no less painful to them to hear his arraignment of existing social wrongs and errors in
“From the Earth, a Cry,” where he wound up with,

God purifies slowly by peace, but urgently by fire.

But it should be remembered that when O'Reilly speaks of the “order of God” flaming revolution, he means the underlying harmony, the abiding and far-reaching law, which adjust things often by sudden and violent force.

I know well, from my talks with him, that no man deprecated more than he did riotous disturbance and upheaval for the correcting of wrongs. Others know as well that in a certain Irish convention at Philadelphia he more than any other was the active factor in fettering and crushing the “dynamite” party. And in “The Word and the Deed,” he expressed his philosophy thus :

The Word is great, and no Deed is greater,
When both are of God, to follow or lead;
But, alas, for the truth when the Word comes later,
With questioned steps, to sustain the Deed.
Not the noblest acts can be true solutions;
The soul must be sated before the eye,
Else the passionate glory of revolutions
Shall pass like the flames that flash and die.
But forever the gain when the heart's convictions,
Rooted in nature, the masses lead:
The cries of rebellion are benedictions
When the Word has flowered in a perfect Deed.

Elsewhere he wrote :

Sorrow, next joy, is what we ought to pray for,
And, next to peace, we profit most from pain.

So, too, in “The Statues in the Block” (a remarkable piece of strong and polished blank verse, handled with fine skill, yet alive with deep reflection and exquisite feeling), he presented in another way the theory of unselfishness :

True love shall trust, and selfish love must die,
For trust is peace, and self is full of pain.
Arise, and heal thy brother's grief; his tears
Shall wash thy love, and it will live again.

The moral which he instilled into the individual he prescribed also for the whole race. His teaching was that every one must be gentle; just, generous.

Hunger goes sleeplessly
Thinking of food;
Evil lies painfully
Yearning for good.
Life is a confluence:
Nature must move,
Like the heart of a poet,
Toward beauty and love.

But now and again the revolt against things which are not as they ought to be and the fierce spirit of appalled prophecy would take hold upon him and move him strongly, and at such times he launched terrible words of admonition or spoke more mildly as a dispassionate seer of

The People's strength, the deep alluring dream
Of truths that seethe below the truths that seem.

At other moments he took the sagacious, practical view, reminding us tersely that

Like a sawyer's work is life:
The present makes the flaw,
And the only field for strife
Is the inch before the saw.

In epigram, indeed, he excelled, and I wish it were possible to quote here some of his diamond-pointed sayings. But throughout all his moods, whether those of the lyrist pure and simple, caroling joyously; the prophet and philosopher; the wit; or the enthusiast for real human advancement, he upheld unflinchingly the ensign of idealism, as in "The Cry of The Dreamer."

I am tired of planning and toiling
In the crowded hives of men;
Heart-weary of building and spoiling,
And spoiling and building again.
And I long for the dear old river
Where I dreamed my youth away;
*For a dreamer lives forever,
And a toiler dies in a day.*

Yet in his poem on the "Pilgrim Fathers," delivered at the dedication of the monument to the founders of New England at Plymouth, he spoke of them as

Dreamers who work — adventurers who pray!

He believed in having the dreamer work, after all. But he likewise believed that labor must be futile unless inspired by great and lofty idealism. His own life had been full of adventure, but he had learned that adventure was useless without prayer and a purpose. The breadth of Boyle O'Reilly's thought and the sincerity of his aim are evidenced in this poem. It was not one of his best, speaking technically, but it contained lines which will probably live after us. For example:

They had no model; but they left us one.

And, again, these:

No deathless pile has grown from intellect.
Immortal things have God for architect,
And men are but the granite he lays down.

O'Reilly's brighter side, his wit and fancy, his rude and stirring or picturesque presentation of Australian themes, cannot be touched upon here. But it has seemed worth while to point out the vital element of splendid humanity in many of his poems—the sterling democracy and fervor of liberty, tempered by far-sighted wisdom and true gentleness, that inspired him. It is seldom that we get in our poetry, nowadays, anything so genuine, so outspoken, and, above all, so true to the supremacy of idealism.

George Parsons Lathrop.

The New England Kitchen.

IN one of the most thickly populated parts of Boston there is a corner store over the door of which one reads, "New England Kitchen." On entering the place a novel sight is found. Two long, narrow, high

tables, placed at right angles, answer for a counter over which food is sold. Within the inclosure made by these tables are placed a desk and a chair for the accommodation of the lady who has charge of the work done here. Along the walls there are shelves on which are placed glass jars and cooking-utensils. Farther down the room the lower shelves give place to tables, sink, boiler, etc. On the opposite side of the room some large windows and a door take about half the wall space. By the blank space are set two large steam-kettles for making soup, and a steamer for cooking vegetables. In the middle of the room there is a large gas-table on which boiling can be done. On one end of this table is a large flat vessel, partly filled with hot water, in which stew-pans filled with soup and chowder are placed to be kept hot. Large tables stand near the steam-kettles and the sink. At the upper end of the store, near the windows and doors, are two large Aladdin ovens. In other parts of the room are placed small cooking-apparatus, the fuel for which is either gas or oil; but these are not often used now. The whole room is flooded with light from the three windows and the two doors.

On descending a short flight of stairs there is found a basement of the same size as the upper room. Here there are three large Aladdin ovens in which beef stock is cooked, the two in the upper room being used for pressed and spiced meats, puddings, etc. All the meats are cut up in this room. The steam-boiler is placed here.

It was about eleven o'clock in the morning when I visited the kitchen. Said the young lady in charge: "The next two hours are the most interesting in the day. Will you sit here and watch the people come and go, or do you wish to ask me questions?"

As I wished to do both, we chatted while the work went on. Four persons were busily engaged in filling cans and pails with chowder and soup, wrapping them in some non-conducting material, and placing them in boxes or in fiber pails. These soups were to be delivered. The question of the economical delivery of the soups has not yet been settled, but that will come in time.

"We have to plan all sorts of ways to get the food hot to its destination," said the attendant. "You see those muff-boxes? They are for the teachers in the high and normal schools. Small cans are wrapped in non-conducting fiber and placed in these boxes. Of course the boxes wear out quickly, and have to be replaced, making their use expensive. Those large cans go to manufacturing establishments where women are employed, to some of the dry-goods stores, clubs, etc."

"Do you keep a man to deliver the food?" I asked.

"Our man does the greater part of it, but he could not do it all. There is a junkman across the way who delivers the school orders. Ah! here are my errand-girls. These two little girls take small orders from twelve to two o'clock. Some people are willing to pay five cents extra to have their lunches delivered, so the little girls take these small orders. Sometimes they have only one order, and sometimes four or five apiece. They each earn about eighty cents a week, which means a great deal to such poor children. It is wonderful how they improve in dress and general appearance when they have been doing the work for a few

months. They are honest and prompt in bringing back the money for the articles delivered."

Between eleven and one o'clock men, women, and children of all sorts and conditions come and go. A well-dressed gentleman takes a quart jar from his hand-bag, and has it filled. Is it for himself, or is he a doctor who is taking this nutritious and savory beef-broth to a patient? A feeble old man brings in his pail to be filled. Dainty-looking young women, who perhaps are workers in shops, or teachers, or possibly students who provide their own meals, take away in their shopping-bags soups, stews, chowders, pressed beef, and health bread. Little children, black and white, come with their pails, plates, bowls, and pitchers. Old and middle-aged women appear, some apparently prosperous, and others with the stamp of poverty and hard work fixed upon them. All the people are a most interesting study. The perfect cleanliness, the gracious manner in which customers are served, the quiet, order, neatness, and despatch with which the vast amount of work is done, are marvelous.

The reader may ask, What are the origin and aim of this New England kitchen? Is this a charity or a money-making enterprise? It is not exactly either; its object is to cultivate a taste for good, nutritious food, scientifically prepared from the cheaper food-materials. It started in the following manner. In 1888 Mr. Henry Lomb of Rochester, New York, offered two prizes, \$500 and \$200, for the best essays on practical sanitary and economic cooking. Seventy essays were submitted, but only one met all the conditions. This was entitled "The Five Food Principles, Illustrated by Practical Receipts."

Mrs. Ellen H. Richards of the Massachusetts Institute of Technology, a member of the committee, had been interested for many years in the scientific selection and preparation of food. It seemed to her that if such a wide-spread publication of the conditions and rewards for essays on the selection and preparation of simple foods brought such poor returns, there was great need of some work to develop the knowledge and practice of scientific cookery. This undertaking was not a light one, and many things were necessary for the success of such an experiment—costly apparatus for laboratory and kitchen experiments; a woman with a taste for, and a practical knowledge of, cooking; a scientific training; the money to defray the expense of the project.

At this point Mrs. Richards thought of the author of the prize essay, Mrs. Mary Hinman Abel. Mrs. Abel is a college graduate who had spent five years in Germany with her husband, Doctor, now Professor, Abel of Michigan University. She had absorbed enough of the scientific spirit to flavor the work. Mrs. Richards met her in New York, and found that she would give six months to the work. At the end of that time she must join her husband.

As soon as Mrs. Abel's services were secured friends of the cause pledged the financial aid. The next thing was to find the proper place in which to start the work. The store at the corner of Pleasant and Winchester streets, Boston, was leased, and for six months Mrs. Abel and Miss Bertha Estey, her valued assistant, devoted themselves to the work of developing dishes and getting the kitchen into working order. This work was so admirably done that there has been no change

in the methods, although the work has been much enlarged and is still growing.

During the first six months there were perfected six standard dishes which stood the test of daily sale. They were nutritious, palatable, easily made and served, and suited to the popular taste. Others were soon added. Besides the many experiments made at the kitchen, analyses of some of the dishes were made daily or weekly at the Institute of Technology. These prices were fixed upon for the various articles: beef broth, 18 cents a quart; beef stew, vegetable, potato, and tomato soups, 12 cents; pea soup, 10 cents; fish, clam, and corn chowders, 16 cents; evaporated milk, 7 cents a half pint; pressed beef and spiced meat, 16 cents a pound; cracked wheat, oatmeal mush, corn mush, boiled white hominy, and boiled yellow hominy, 5 cents; hash, 8 cents; rice pudding, 12 cents a quart; Indian pudding, 15 cents; health bread, small loaves, 5 cents each; white bread, 5 cents a loaf.

Mrs. Abel's report covered the first six months of the work, a period which was largely experimental. When she joined her husband, her place was taken by Miss Wentworth, a cultivated young woman, graduated from Vassar College in 1879, and later a student at the Institute of Technology. The work grew to such an extent that the steam-kettles and gas-table became a necessity. The beef-broth is still cooked in the Aladdin oven, but the soups that require to be brought to the boiling temperature are made in the steam-kettles. The methods and standard of the work are kept as Mrs. Abel left them. From ninety to one hundred quarts of soup are sent out every day, and from seventy to one hundred and fifteen quarts are sold over the counter.

A particularly interesting fact came to light in the course of the conversation the day I visited the kitchen. Miss Wentworth said that on holidays and Saturdays the sale is very light, showing that the children of the greater part of the poor people are in the habit of doing much of the housework when out of school, and therefore at such times there is no need of going to the kitchen. On Mondays, too, the sales are light, a part of the Sunday dinner serving for the midday meal on Monday.

To the hard-working woman and her family the New England Kitchen is an inestimable blessing. Here on her busiest days she can get nutritious and savory food nearly as cheap as she could prepare it herself, even if she knew how. A branch of the kitchen has been established in another tenement-house region at the North End of the city. It is hoped that many such branches may be planted in various places.

But Boston is not the only city that is to be benefited by this work. Mr. Havemeyer has pledged six thousand dollars to Professor Eggleston for the establishment of a kitchen in New York. A superintendent has been engaged, and it is thought that the work will begin before the end of this year. A kitchen has just been opened in Providence, Rhode Island, and there is talk of establishing one in Buffalo, New York, as well as in several other places in various parts of the country.

I believe that the scope of the kitchens should be much larger; that, beside soups, it should be possible to prepare and sell the cheaper cuts of meat in the form of braises, and some combinations of meats and

vegetables which require long cooking, and therefore are out of the reach of the woman who must work outside of her home many days in the week. The managers of the New England Kitchen do not feel that they have reached a point where the work can go on without any addition or improvement; on the contrary, they are still experimenting slowly and carefully, and no doubt before many years pass they will have solved one of the greatest problems of the age—how the masses may be economically and well fed. When the people who to-day depend for two thirds or more of their food upon bakers' bread, pies, cake, and dough-nuts, with tea or beer as a drink, are educated up to the point where they choose soups, well-cooked cereals, and good milk instead, there will be a great gain in their physical and moral condition. It is not that this country lacks the raw materials with which all the people could be well fed, but the material is ruined in the cooking. One has only to spend a little time in a few of our large institutions to see that immense quantities of food are spoiled in the unscientific methods of cooking. I think the New England Kitchen will do for good cooking what the Fleischmanns have done in the last fifteen years in this country for good bread. When they started the Vienna Bakery at the Centennial Exposition in Philadelphia they set the right example of bread-making. People acquired a taste for good bread, and demanded it, and they have been getting a better article every year. This will be the case with the people as they acquire a taste for savory, nutritious foods scientifically cooked.

Parks and Playgrounds for Children.

THE New York Society for Parks and Playgrounds for Children was incorporated on November 18, 1890. Mr. Abram S. Hewitt is the President. Its purpose is to provide healthful recreation for the 500,000 boys and girls in this metropolis, and thereby help to counteract in New York the physical and moral degeneration which follows the crowding together of people in great cities. The movement began in an effort to open Rutgers Slip for the children of the Seventh Ward. In this division of the city are 75,000 people, most of them living in tenements, and there is not in the ward a foot of ground where children may play without interference by the police. Rutgers Slip is an open plot of ground 320 by 174 feet. For twenty years it has been covered with rubbish, and until a young man, walking summer before last through the overcrowded East Side in search of sites for possible parks, happened upon it, nobody seems to have thought of the place except as a potter's field for broken-down wagons and decrepit tinware. Through the efforts of the new society Rutgers Slip has been set aside for playground purposes by the city authorities, and the Park Board is now devising plans for improvement.

Meanwhile several ladies secured from the Astor estate permission to fit up as a playground a plot 50 by 100 feet in West Fiftieth street, near the North River. This is the first public playground in New York. At the time it was laid out Boston had 19 playgrounds, exclusive of the Common, and London had 365. New York has 5157 acres of parks for grown-up persons and

children on dress-parade. It had then no spot belonging to the children.

In 1887 the legislature of the State of New York, at the request of Mayor Abram S. Hewitt, passed the "Small Parks" Act, permitting New York city to expend a million dollars yearly in acquiring land and laying out small parks in the crowded districts. The provisions of this law are not being carried out as rapidly as the promoters of the project desire, and one object of the society is to induce city officials to purchase land for new parks to the extent permitted by the statute.

In August of last year a meeting was held to advocate turning the "Old Ball Ground" and "The Green" in the southwest corner of Central Park into a public playground. This meeting started a general movement which found expression in public meetings in halls and the open air, and in parades of workmen. At a meeting of the Park Commissioners held September 24, 1890, the matter was referred to Superintendent of Parks Samuel Parsons, and to the landscape-gardener, Mr. C. Vaux. These gentlemen, with Chief Engineer Kellogg, reported that the scheme was entirely feasible. They recommended the erection, at a cost of \$50,000, of a combined playhouse and bridge over the driveway which separates the two meadows, and the expenditure of \$25,000 in providing means for outdoor sports. The issue is still undecided.

On January 8 was opened the first public playground of the new society. William R. Stewart secured from the Rhinelander estate the indefinite free lease of a plot of ground 200 feet square and extending from 91st to 92d street in Second Avenue. This plot has been graded at a cost of \$1000 and inclosed by a high board fence. Two young enthusiasts have been placed in charge, and the playground has been fitted up with swings, wheelbarrows, shovels, toy wagons, and seesaw boards for small children. For the older boys games like foot-ball and "pull-away" are organized, and races and other athletic exercises encouraged. The most popular diversion is a parade with drums, banners, and American flags. The first parade ended in a riot, in which one of the well-meaning but unappreciated organizers was pelted with stones; but the boys have now learned the practical value of discipline, and the parades are successful.

Individual life in New York is so active that friendships between old and young, which are common and helpful in the country, are almost unknown. Parental influence is also very slight, and this condition obtains not only among the working masses but among the pleasure-seeking classes. Children are isolated in New York. Those of the poor are constantly subject to the contaminating influences of the street without the tonic of a healthy home life. The tendency of modern living is not toward the home, but toward the street, the saloon, the school, the lecture-hall, the restaurant, the reading-room, the night classes, the vices of the dark—toward everything and every place that means aggregation. The children live in a state of imperialism while in the school-room, and lapse at once into a state of anarchy when they leave. To them law and discipline are tyranny and disobedience is freedom. The Society for Parks and Playgrounds believes that the easiest way to teach children ethics is by object-lessons, and it purposes adding a course in democracy to the

lessons in autocracy and anarchy which children imbibe in the schools and streets. The society intends to furnish not only playgrounds but organizers of games. It purposes to find instructors who will join with the children in their sports, teach them the economy of organization, and demonstrate that the happiness of the individual depends upon the harmony of his relations with his associates. All this must be taught by example and not by lecture, and tact, patience, and enthusiasm are necessary in the teacher. The society believes, however, that the result in bodily health and mental discipline will repay the effort.

Briefly stated, then, the objects of the New York Society for Parks and Playgrounds are these:

To furnish eventually, for all boys and girls, at pub-

lic expense, the playgrounds which not even wealthy parents now provide for their children.

To invoke immediately private liberality in furnishing temporary playgrounds which shall be models for municipal imitation.

To secure, in public parks, plots specially devoted to children's recreation.

To obtain the coöperation of labor-unions and political organizations.

Similar societies should be formed in all large cities. The smaller towns and villages should set apart large open spaces for the children now while land is cheap. The physical welfare of the children means the happiness of future humanity; and this deserves one thought even in the rush and whirl of modern business.

Walter Vrooman.

IN LIGHTER VEIN.

Understood.

I LOVED a maiden once as well
As she was passing fair,
And that is more, the truth to tell,
Than now to love I'd care;
And she would let me kiss her hand
When I'd been very good—
That is, if I would "understand."
At length I understood.

I asked her for her photograph
To light my lonely room;
She laughed a merry little laugh,
But left me to my gloom;
For that was such a "strange" demand
She did not think she could—
Because I might not "understand."
And then I understood.

I wooed her in the morning, noon,
And afternoon, and night,
I would have fetched the very moon
And stars for her delight;
She said my love was truly grand,
And that some day she would—
And hoped that I would "understand."
How well I understood!

At last I took by force of arms
The kisses she denied;
Her dimples were her chiefest charms,
And so she never cried,
But faltered as with nimble hand
She rearranged her snood,
"I knew you would n't understand!"
But I *had* understood.

William Bard McVickar.

Smithy Song.

WHEN I am half a-dreaming,
And only half asleep;
When daylight's grayest gleaming
'Gins through the blinds to peep,
Oh, then I hear the dinging
Of the smithy hammers ringing,
Ching ching, ching ching,
Ching ching, ching ching.

At eve when I'm returning
From labors of the day,
Their forges yet are burning,
And still their hammers play;
And oft the smiths are singing
To that measured, merry ringing,
Ching ching, ching ching,
Ching ching, ching ching.

Often with rhythmic bending
Of bodies to and fro,
They toil in couples, sending
The sparks out, blow on blow;
One hammer always swinging
The while the other's ringing,
Ching ching, ching ching,
Ching ching, ching ching.

O merry anvils sounding
All day till set of sun!
It is by steady pounding
That noblest tasks are done.
By sturdy blows and swinging
That keep the world a-ringing,
Ching ching, ching ching,
Ching ching, ching ching.

George Horton.

Jack Frost.

THY pencil lend me, Jack,
And with it, pray,
Thy cunning etcher's knack.
I too would play
The artist on my lady's window-pane;
So shall she deign
To read my verses pricked in sparkling ice,
With quaint device
Of wreathed fern and frond and feathered grass.

But stay, alas!
My burning fingers mar thy tempered tool;
Thy heart is cool,
And doth not spoil thy knack.
Here, take thy pencil, Jack!

Esther B. Tiffany.

The Blue and the Gray.

HER eyes were blue and his eyes were gray.
Gray challenged Blue, and Blue entered the fray.
Hitherto Gray had fought for the rights of his state;
To fight for the *union* at last was his fate.

R. W. P. Noble.

The Little Tunker Bonnet.

A MAIDEN came driving a sleek black mare
Into the town, into the town;
And the light wind lifted her raven hair
In innocent ringlets hanging down
To the neck of her fleecy, lead-colored gown,
From under the puckered, silken crown
Of her little Tunker bonnet.

She 'd a red-rose lip and an eye of brown,
And dimples rare, and dimples rare;
But the lassies laughed as she rode in town,
For the graceful gown that she wore with care
Had never a flounce upon it,
And they made remarks on her rustic air,
And wondered what country hulk would dare
Make love to that "queer old bonnet."

O merry town girls, you do not know,
Acres are wide, acres are wide;
And wheat- and corn-fields lying a-row
Are the Tunker's wealth and the Tunker's pride;
And the farm and the houses on it,
The cow for milk, and the horse to ride,
Are gift and dower for the bonny bride
That weareth the Tunker bonnet.

But the merchant beau in the dry-goods store
Welcomed her in, welcomed her in;
And the sweet little face with smiles ran o'er
As the cunning purse of crocodile skin,
With the clicking clasp upon it,
She drew at each purchase, and from within
Coaxed arguments that were there to win
Sure grace for the Tunker bonnet.

Then she mounted her buggy and drove away
Through meadows sweet, through meadows sweet,
Where her graybeard father raked the hay
By the Tunker church where the turnpikes meet
The church with no steeple on it.
Said the merchant, musing, "Her style is neat.
I'll join the Tunkers, raise beard and wheat,
And win that little bonnet."

Benjamin S. Parker.

A Paradox.

If white be "all the colors combined,"
And black their "absence" be,
Then are n't the whites the colored folks,
The blacks from color free?

Lydia C. Heckman.

Friends Only.

A REPLY TO "NEIGHBORS," BY R. T. W. DUKE, JR., IN THE
CENTURY FOR JUNE, 1889.

My name *is* Helen; so far you are right.
My eyes are neither blue nor dark as night,
As in your "notes and queries" you suggest,
And optics black and blue I quite detest.
Believe me, I 'm no pugilistic miss,
To warrant a suggestion dark as this.

My form, you ask — large, medium, or petite?
Well, over five, and under seven feet.
And then you ask me where I live? How queer!
But since you wish to know, I live — right here.
So we *are* neighbors, but please understand
You need not follow the divine command.

Your query as to hose I must rebuke;
I scarce expected it from you — a Duke!
I 'm but a modest lass, and think it shocking
To ask the color of a lady's stocking.
My song is sung to please the editors
Primarily, and then my creditors.

Don't speak of hope deferred, for this I ask it —
It calls up memories of that awful basket.
Now I 'll interrogate. Please let me know
If you at times affect a "cameo."
I know not why I ask you this, and yet
Your name suggests to me a cigarette.

If so it be I 'm sorry that I spoke;
We 'll let our friendship end — like them — in
smoke.
Not friendship, though; that name too sacred be
For those who meet once in a CENTURY.
As you suggest, we met by chance alone,
So I 'll remain, at least to you, unknown.

So you 're a married man! So much the worse.
Your wife, not I, should animate your verse.
You should not waste on me your thoughts —
and ink.
Whatever would her Grace the Duchess think!
I hope they sent the check; your grief 't will
smother,
For 't is n't Helen writes this, it 's her brother!

F. H. Curtiss.

Embarrassing to a Modest Man.

IN misery most deep am I immersed:
I 'm saturated so with Shakspeare's wine,
I really cannot tell — and hence am cursed —
Which thoughts are gentle Will's, and which are mine.

John Kendrick Bangs.

Christmas Day.

(Uncle Seth loquiter)

A GOOD old-fashioned Chris'mas, with the logs upon the hearth,
The table filled with feasters, an' the room a-roar 'ith mirth,
With the stockin's crammed to bu'stin', an' the medders piled 'ith snow—
A good *old-fashioned* Chris'mas like we had so long ago!

Now *that's* the thing I 'd like to see ag'in afore I die,
But Chris'mas in the city here—it's different, oh my!
With the crowded hustle-bustle of the slushy, noisy street,
An' the scowl upon the faces of the strangers that you meet.

Oh, there's *buyin'*, plenty of it, of a lot o' gorgeous toys;
An' it takes a mint o' money to please modern girls and boys.
Why, I mind the time a jack-knife an' a toffy-lump for *me*
Made my little heart an' stockin' jus' chock-full o' Chris'mas glees.

An' there's *feastin'*. Think o' feedin' with these stuck-up city folk!
Why, ye have to speak in whispers, an' ye dar's n't crack a joke.
Then remember how the tables looked all crowded with your *kin*,
When you could n't hear a whistle blow across the merry din!

You see I'm so old-fashioned-like I don't care much for style,
An' to eat your Chris'mas banquets here I would n't go a mile;
I'd rather have, like Solomon, a good yarb-dinner set
With *real* old friends than turkle soup with all the nob's you 'd get.

There's my next-door neighbor Gurley—fancy how his brows 'u'd lift
If I 'd holler, "Merry Chris'mas! Caught, old fellow, Chris'mas gift!"
Lordy-Lord, I'd like to try it! Guess he'd nearly have a fit.
Hang this city stiffness, anyways, I can't get used to it.

Then your heart it kept a-swellin' till it nearly bu'st your side,
An' by night your jaws were achin' with your smile four inches wide,
An' your enemy, the wo'st one, you 'd just grab his hand, an' say:
"Mebbe *both* of us was wrong, John. Come, let's shake. It's Chris'mas Day!"

Mighty little Chris'mas spirit seems to dwell 'tween city walls,
Where each snowflake brings a soot-flake for a brother as it falls;
Mighty little Chris'mas spirit! An' I'm pinin', don't you know,
For a good *old-fashioned* Chris'mas like we had so long ago.

Alice Williams Brotherton.

To a Southern Girl.

HER eyes
Would match the Southern skies
When Southern skies are bluest;
Her heart
Will always take its part
Where Southern hearts are truest.

Bright pearls,
The gems of Southern girls,
Her winning smile discloses;
Her cheeks,
When admiration speaks,
Wear only Southern roses.

Her voice,
By nature and by choice,
E'en those who know her slightest
Will find
As soft as Southern wind
When Southern winds are lightest.

Her laugh,
As light as wine or chaff,
Breaks clear, at witty sallies,
As brooks
Run bubbling through the nooks
Of all her Southern valleys.

Such youth,
With all its charms, forsooth,—
Alas, too well I know it!—
Will claim
A song of love and fame,
Sung by some Southern poet.

But she,
In future years, maybe,
These verses may discover,
Sometime
May read this little rime
Sung by a Northern lover.

James G. Burnett.

A Christmas Toast.

HERE 's a round to thee, Dan Chaucer,
At the festal Christmas time.
Pledge me, poets—to the master
Of our gentle art of rime.

To the eldest of our brothers,
To the honor of his name,
To the sweetness of his spirit,
To the glory of his fame;

To that voice whose music echoes
All the centuries along,
Propheying art triumphant
In eternity of song.

No. 3.

THE JEWS IN NEW YORK.

THE eleventh census of the United States of America will not furnish more than a clue to the numerical strength of the Hebrews in the commercial metropolis. Its scope is institutional rather than personal. The inquiries of its agents did not extend to the religious faith of individuals, but information was sought from the authorities of each congregation what was the seating capacity of its edifice, the value of its property, and the number of its adherents. Philip Cowen, the expert intrusted with the collection and tabulation of Jewish statistics, imperfectly and tardily rendered in response to printed inquiries, estimated the number of Jews living east of the Bowery and south of Fourteenth street at 135,000, and that 40,000 more were scattered over the rest of the city. In April, 1890, good Hebrew judges reckoned the number of resident Poles and Russians at 50,000, Germans 50,000, Roumanians 25,000, Hungarians 25,000, and of all other nationalities at 50,000. In February, 1891, Secretary Charles Frank of the United Hebrew Charities calculated the total at from 225,000 to 250,000, and predicted an additional immigration of from 45,000 to 50,000 in the following months of the year. In 1890, 32,321, of whom 23,970 remained in the city, landed at the port of New York. Of the 8350 passing on to other destinations many returned to work out their own future amid the crowding difficulties of civic environment. Among the arrivals were 6056 Austrians, 25,154 Russians, 506 Roumanians, and 517 Germans. "Immigration," remarked an intelligent Jewish observer, "in five years has averaged

25,000 a year, of which more than 70 per cent. have stopped in New York." There, in the Jewish quarter, the number of inhabitants averages 330,000 to the square mile. In the most densely populated region of old London the average is only 175,000. The English hive cannot exhibit a single cell like the seven-story house in New York which lodges, or did lodge, 36 families, including 58 babies and 38 children over 5 years of age.

Nearly all countries, civilized and semi-civilized, have contributed to this startling exhibit, which is larger than that of any other locality on the face of the globe. The first contingent appears to have arrived from Brazil, after that country was relegated to Portuguese rule in 1634. A small band of Jews of Dutch origin managed to reach New Amsterdam in the "Virgin World" of which Emma Lazarus speaks —

Where doors of sunset part,
Saying, "Ho, all who weary, enter here!
There falls each ancient barrier that art
Of race or creed or rank devised, to rear
Grim bulwarked hatred between heart and heart!"

Many of these were constrained by the persistent antagonism of the testy governor, Peter Stuyvesant, to leave New York in 1657, and to settle in Newport, Rhode Island, the real American cradle of civil and religious liberty. Those who remained prospered greatly. Certain retail trades fell entirely into their hands, and many attained mercantile eminence.

Portugal and Spain remotely sent out that portion of the Hebrews which constituted the congregation Shearith Israel (Remnant of Israel) in 1680. Then, as now and always, a

qualified layman might officiate in the synagogue where no chazan, or reader, had been provided. This body, however, had such from an early date. In 1729 the first building dedicated to divine worship was erected in Mill street. This was followed by one in Crosby street, then a fashionable locality. The neighborhood changed in character, residents moved up-town, and at last the congregation rested in its present architecturally unique home in Nineteenth street, near Fifth Avenue. Incomers from other lands assimilated with them, and adopted their social and religious habits and customs. In the Revolution all seemed to have espoused the popular cause, and numbers did excellent service in council and in field. Most conspicuous among them was the Rev. Gershom Mendes Seixas, chazan of the Shearith Israel congregation, who for twenty-eight years was a trustee of Columbia College, and a great power in the Jewish community. Haym Solomon was another influential New-Yorker. His wealth was unstintingly poured out in behalf of the struggling colonists. Madison called himself a "pensioner" on Solomon's favor. To the large-hearted Hebrew, whose general philanthropy was commensurate with his patriotism, was committed negotiation for war-subsidies from France and Holland.

Sephardic, or Spanish and Portuguese Jews, held aristocratic rank among their brethren, and even now on rare occasions are said to exemplify somewhat of the haughty and exclusive spirit proper to a hereditary caste. Formerly marriage with those outside their own circle, owing to inequality of culture, was an infrequent occurrence. Adherence to the rites, forms, and ceremonies practised by European ancestors was exceedingly tenacious.

The congregation Benai Jeshurun, founded in 1824, consisted of immigrants from England, and a sprinkling of persons from other parts of the Old World. There were also one or two Polish congregations following the Polish Minhag, or ritual. The congregation Anshe Chesed was formed by natives of Holland, strengthened by a few Germans and others. These assemblies, with their instructions and characteristics, for some time represented the Judaism of New York.

Between the years 1820 and 1830 a large German-Polish immigration entered New York, stimulated thereto by the intensifying *Judenhetze* that restricted the sons of Jacob to certain occupations, intolerantly excluded them from the more honorable vocations, and closed all avenues to preferment in official career or scientific profession. An influx of Teutonic Hebrews thereafter continued, until they outnumbered those of all other nationalities. New congregations arose, and used the Ashkenazic, or

German, ritual in divine worship. Jealousy and intolerance, springing from provincial prejudices, also appeared, and exerted an unpleasant influence upon the moral and social character of metropolitan Judaism. But this was counteracted, in great measure, by some of the younger generation, who, educated in American schools, infused a better spirit into their coreligionists, and thereby improved the general tone. Joining a congregation became a social necessity. Peddlers returned to the city twice a year—during the spring and fall holidays—to replenish their stocks, and to join their brethren in religious exercises. At the great Hebrew festivals the young people of both sexes met in social gatherings. Among the better educated the theme of conversation was not infrequently the possible union of jarring congregations, elevation of their intellectual and moral status, and the investment of Judaism with more imposing dignity. Out of these discussions came most gratifying results.

Immigration from Slavic lands is of comparatively recent date. That from Russia, impelled by the fanaticism of the Czar and his confidential advisers, is of hordes barbarous in speech, alien in habits, and in many cases broken-spirited by tyrannical and foul treatment. Fugitives from intolerable oppression and merciless cruelty that first broke out in 1881, and have continued with little intermission until the present time, they add a new and busy element to composite population, and demand the wisest and most persistent endeavor to harmonize their inner life with American currents of thought, and to identify them with all that is proper to our republican civilization. A few are said to have left wife and family to get an early share of the princely Hirsch fund, supposing that it is intended for indiscriminate distribution. That this is a gross delusion goes without saying, but none the less does it incite addition to the undesirable immigration the inconveniences of which to the general public the Hirsch fund was, in part, intended to relieve. Beneficiaries in New York write to the friends left behind. These hasten to follow, and come in tens of thousands. On arrival they are met by more fortunate coreligionists, proud of common origin and history, who welcome them to "homes" like that of the Hachnasath Orchim Association, No. 210 Madison street, where food, shelter, and other necessary aid are administered, and the recipients are placed in a position to provide things honest in the eyes of all men. Daily scenes in the office of the United Hebrew Charities, No. 128 Second Avenue, are extremely prolific of suggestion, and evoke profound and comprehensive thought. The cringing civility of the Slavic applicant, born of the despoiled spirit and despair of redress, is mildly but

COHANIM BLESSING THE PEOPLE.

firmly rebuked, and the exhibitor taught to demean himself as one whose newly acquired rights are on the same plane with those of all constituents of the national life.

The lesson is one which the pupil is quick to acquire. The "Jüdisch-Deutsch" or Hebrew-German jargon, spoken by his brethren in Galicia, Russia, Poland, and Germany, will long linger on his lips, and furnish household words to the family circle, but just as certainly will it give place to the United States vernacular, as the Hebrew characters in which English advertisements appear on sign-boards in

the Jewish quarters will be replaced by letters familiar to Anglo-Saxon vision. The general disintegration of ideas and practices that begins when immigrants from all climes first tread upon American soil is only preparatory to future integration with all that is distinctive of their new abode and political people. To this end all the energies and resources of intelligent, liberal Judaism are directed.

Modern immigration is of merchants, manufacturers, and artisans chiefly. Farmers are notably few. As agriculturists the Jews are not remarkably successful. Their colonies in Kan-

sas and Dakota were total failures. In New Jersey it is otherwise. The settlements at Vineland, Alliance, Rosenhayn, and Carmel accomplish all that can be expected reasonably. Sewing-machines, operated by the farmers and their families, help to eke out a livelihood.

In 1890 the trustees of the Baron Maurice de Hirsch fund were empowered to disburse \$10,000 per month in the establishment of schools, purchase of tools, transportation of persons, and relief of pressing need. Sums invested in farms and agricultural implements, for Russian and Roumanian Jews in New Jersey, are not unseldom secured by pledge of real estate or chattels on the part of the borrowers. The helpless immigrants, through use of these facilities, and aided by industrial training, soon become self-sustaining and independent. During the transformatory process they are judiciously instructed in the language and political constitution of the country, as a means of social assimilation, and conversion into useful and patriotic citizens. Similar policy is pursued wherever the unwelcome strangers are located, and is by them welcomed with enthusiasm as the conveyance of hope into otherwise barren and wretched lives. The entire fund is now under the control of designated trustees, who may not only expend the interest but also part of the principal if need be, and that with the pleasant certainty that impairment of capital will be made good by the great financier. There

is, however,
but little probability of
great im-

pairment. A surprisingly small sum is sufficient to give each borrower a start. Within a few weeks or years at the furthest all loans are repaid by the more thrifty.

Many of the Slavonic Jews enter into the old-clothes traffic, and fill the classic Baxter street with quaint and busy shops. All through the eastern Jewry of New York, where non-Abrahamic humanity is extruded by force of circumstances, foreigners under uncouth skull-caps, with flowing beards, and clad in long-skirted caftans, jostle feminine compatriots who at sixteen are hoursis and at thirty hags—charming brides at the former age, careworn matrons at the latter. Their children fill the public schools in the Tenth Ward, which on Jewish holidays are practically closed for want of pupils. In the noisome tenements that they crowd to overflowing every inmate is a tireless worker. Avails of industry are pitifully meager, but the cost of subsistence satisfactory to the bread-winner is trifling. Thrift is the prevalent characteristic, and too often hardens into avarice and greed. Men stint themselves in some cases to establish deposits in the savings-banks, and soon exhaust the hoard in consequent weakness and suffering.

Such people will not always reside in tenements. Nor do they. Accumulations are invested in real estate. The tenant becomes a proprietor. The stifling rookery is torn down, and replaced by a spacious, aspiring structure that yields richly remunerative returns to the erector. "Weech house will you take?" wheezed out a Slavic bondsman in police court. "How many have you?" queried the officer. "Seeks." "Six! You infernal Jew—and here I've been born and raised in this country, and have n't one." Whose fault it was that he was thus houseless is a question that the irate officer did not care to consider.

Change of residence to better sections of the city, and even to costly mansions on Fifth Avenue and Riverside Park, is the sequence of forethought, acquisitiveness, and shrewd investment on the part of many Semitic citizens and their descendants. None respond more willingly to the elevative forces of modern civilization. That fowls are not more frequently domesticated in tenement quarters is due in some measure to visitations of the sanitary inspector, but much more to constant inculcation of cleanliness by coreligionists. Habit is the bequest of antecedent environment. Dirt breeds disease. Foul air poisons life at its sources.

CHANUKAH—THE FEAST OF LIGHTS.

PASSOVER SUPPER.

Domiciliary temperature is parboiling. The home is too often the workshop also. Sewing-machines whir mercilessly until muscle loses its force, and mind sinks into vacant apathy. Young children are driven by usurping lodgers into the streets, and there find themselves in the way of an army of hucksters. The city has no room for them. In interior rooms that would be more filthy than they are but for the Friday afternoon cleaning up for the Sabbath, the thorough cleansing in the spring for the Passover, and the hardly less thorough renovation for the summer and autumn festivals, the seeds of disease too often enter their sickening bodies, and may pass thence to the buyers of ready-made clothes. "Am I my brother's keeper?" He is ours—in some sense. The mysterious invasion of the homes of the wealthy by deadly disease often originates in East Side tenements, where Irish, Italians, and Hebrews perspire in the worse than Egyptian bondage of grinding taskmasters. The Jews have inscribed their hate of the system that holds them in slavery upon the banners of labor parades. "Down with sweating" is a sentence fraught with manifold significance. Mr. Jacob A. Riis writes: "I have found in three rooms father, mother, twelve children, and six boarders. They sleep on the half-made clothing for beds. I found that several people slept in a subcellar four feet by six, on a pile of clothing that was being made." In vain is the ordinance

of the "Schulchan Aruch," that "no one shall go more than four cubits (six feet) from his bed without washing, because of injurious exhalations." Overmastering circumstances forbid obedience. The fault cannot fairly be charged to the "sweaters," or rather to the sweated, who toil from six in the morning until eleven at night. Fifty cents is not an unusual compensation for these murderous hours. Trousers at 84 cents per dozen, 8 cents for a round coat, and 10 cents for a frock coat, are labor prices that explain the sudden affluence of heartless merchant manufacturers, and the biting poverty of miserable artisans.

Competition among the workers is combative, and pernicious to all parties. Excellent trade-schools do something to mitigate causative incitements thereto. Trades-unionism also interferes, but with such lack of judgment as often to aggravate the misery. Nowhere is litigation more irritable or comic than in the Jewish quarter. To the police its quarrels are a constant grievance.

The persistent forces so blindly struggling in the lives of Slavonic Hebrews will, when wisely guided, certainly place them in higher relations to the commonwealth than those sustained at the present day. In support of this anticipation is the fact that coreligionists of differing national extraction succeed in all the walks of the world's business—in the fine arts, in journalism, and in the learned professions. In mer-

cantile pursuits their eminence is attested by the names that cover civic sign-boards. Dry and fancy goods absorb the energies of 514 firms, the aggregate rating of whose capital is \$58,000,000. Names of proprietors are as familiar in the mouth as household words to multitudes of shoppers.

In the manufacture and sale of clothing—Mr. Max Cohen, editor of the "American Hebrew" being the authority—there are 264 firms with \$24,000,000 capital; 31 firms, with over \$7,000,000 invested in business, are in the cloth trades; 169 firms, with \$12,000,000 invested, make and sell hats and gentlemen's furnishing-goods. Tobacco and smokers' articles engaged the attention of 165 firms possessed of \$15,500,000 capital in 1890, while 94 firms, with \$10,000,000 capital, are preëminent in the wine and liquor trade. Jewelry, precious stones, and optical goods employ the activities of 133 firms and the power of \$8,500,000. Leather findings and hides are but little less acceptable objects of commerce, judging from the 83 firms with nearly \$7,000,000 of capital that deal in them. So is it with paints and glass, bought and sold by 38 firms, with a capital of nearly \$6,000,000. Furniture, bedding, and upholstery statistics furnish the names of 37 firms whose \$2,750,000 are utilized in the production and sale of these articles. Seventy-four persons or firms have invested about \$5,000,000 in the meat business, and 416 about \$37,500,000 in miscellaneous trades. The average rating of capital controlled by all these 2018 merchants is \$207,388,000.

In no city have the Jews been more successful as traders than in New York. "Of the 400 buildings on Broadway from Canal street to Union Square, the occupants of almost all are Hebrews, over 1000 wholesale firms out of a total of 1200 being of that race. Hebrew firms also predominate on the streets contiguous to Broadway within the territory named."¹ Nor elsewhere have they been more successful, on the whole, as bankers and financiers. The 35 firms whose average rating in 1890 was over \$13,000,000, but whose available capital is, in all probability, \$100,000,000 or more, include the names of Seligman, Hallgarten, Wormser, Lazard, Scholle, Kuhn, Loeb, Schiff, Ickelheimer, Speyer, Schafer, and many others, some of whom are more conspicuous for philanthropy and patriotism than for wealth.

Holdings of real estate by the Jews in New York are estimated at from \$150,000,000 to \$200,000,000, and five eighths of the transfers are said to be for their account.

Judging by police reports there has been less

¹ "The Hebrews in America," by Isaac Markens, p. 150.

of the deceitfulness, chicanery, and fraud that are popularly and often unjustly held to be distinctive of the poorer Jews in the acquisition of this amazing wealth and influence than among an equal number of nominal Christians of similar class. It is certain that the homely virtues of which King Solomon, Franklin, and Smiles are the apostles have been the principal creators of Jewish affluence and power. The prudence which confines expenditure within the limits of income, the diligence which rejoices in improving opportunity, the far-sightedness which deposits money where it will do the most good, and the promise which is held to be as binding as the legal contract, are the chief factors of fortune with them as with all men. The best proof of the moral standing of the Hebrews is to be found in the relatively low percentage of their number in prisons and reformatories. Only two murderers, it is said, have sprung from their ranks in 250 years. Drunkenness is not a Jewish vice. Neither is anarchism a Jewish insanity. Its subjects disavow and even revile Judaism.

Religious differences among men are largely hereditary, circumstantial, and temperamental. Among Jews, as among Christians, some are strict, others liberal, and still others indifferent. The liberals are the Unitarians, the conservatives the Presbyterians, and the orthodox the Episcopalians of Judaism. The number of liberal Jews in New York has been estimated by one Hebrew statistician at from 40,000 to 50,000, inclusive of about 10,000 indifferentists, and the adherents of the orthodox faith at from 175,000 to 200,000. Some of his brethren alter these figures considerably. Whatever the exact truth may be, it is certain that the vast majority are professedly orthodox, their religion and ethics being of rabbinical and legal character. Traditional Judaism, as exemplified by them, is substantially what it was in the days of Christ and his apostles. They permit no change in public worship or domestic ceremony, but rigidly adhere to the code of laws contained in the "Schulchan Aruch," a compilation of regulations and ordinances which date back, for the most part, nearly 2000 years to the celebrated schools of Hillel and Shammai. Service is in Hebrew exclusively, and admits the employment of a reader, or cantor (*chazan*), from any part of the world who is familiar with the patristic language. Thus in the Portuguese synagogue in 112th street, between Third and Lexington avenues, the cantor is Moses Guedalyah, from Mogador, Morocco. When the speakers have been taught to think and speak in Hebrew, converse between those of various national vernaculars is comparatively easy, as in the case of an American rabbi and a Turkish brother from Saloniki, whose gutturals flowed

READING FROM THE SCROLL.

with satisfaction to both at the wedding of the Rev. Dr. H. P. Mendes.

The rabbi is often selected for life, and may or may not, according to arrangement, be the cantor of his congregation. In the Eldridge street synagogue, or *schule*, as it is more commonly called by the orthodox, is an impressive representation of traditional Judaism, modified perforce by the spirit of the time and surroundings. The building itself is Byzantine, with touches

VOL. XLIII.—42.

of the Renaissance, and is yet distinctively Oriental. The Russian banker who is *parnass*, or president, of the congregation is courteous and instructive. So is every member of the pushing crowd that fills it, and whose admission is regulated by policemen and religious officials. Women in the galleries — not half full — interest the visitor, and he evidently interests them. Pierced curtains, sliding on brass rods, like the ancient lattices in the British House of Com-

mons, which permit the ladies to see without being seen, are supposed to seclude Hebrew femininity from the disturbing gaze of the masculinity. But they do not, for the simple reason that deft hands draw them aside, or throw them up, and vision is only supposedly obstructed. The old custom is not in favor with the majority, and will never more be popular, if it ever was, with them. The chazan's desk, or pulpit, is in the middle of the edifice. There his assistant conducts the reading of the Torah, or law. Each worshiper may listen to his cantillation thereof, or to the voices of persons successively called out of the congregation, not to read each his part of Torah, Haphtorah, or Megilloth, as in former years, but to see that the Parashah is duly recited by the assistant chazan, and to repeat the B'rachah, or blessing. The Torah is read in recitative or chanting style, regulated by the "neginoth," or tonic accents. Of the Megillah (scroll) Esther the recitative is joyous and triumphal; of the lamentations of Jeremiah it is sympathetic, sorrowful, and steepens the heart in profoundest grief. The ornamentation of wrappings, which

it is a high honor to detach from, or attach to, the scrolls, is rich and costly. So is that of the veils before the ark. Each of these is of different color, suited to the ritualistic season. That in use on Yom Kippur is pure white.

Lawyers, merchants, artisans, clerks, peddlers, and laborers compose the dense and changeful throng. All are one in respect of race and faith, but many in regard to birthplace and speech. *E pluribus unum* receives a new meaning here. Clad in "tallith," or prayer-shawl, capped or hatted, voluminous of voice and ceaseless in gentle movement, articulate worship alternating between the murmurous play of sunlit waves and the thunder of Oriental hurricane, they suggest the idea of an Arab tribe, under derbys and silk hats, earnestly worshipping the Almighty after the fashion of all Semitic forefathers. But custom is not uniform, neither does it exclude indulgence in talk. Conversation is discountenanced in the more polite congregations. Singing by the choir is superb. As in all other orthodox synagogues, all voices are male. The deep, rich baritone of the chazan is exquisitely fine. Women keep silence in the church, as orthodox rabbis say they ought to do; but they do not look as though they enjoyed the restraint. The music is weird, wakeful, plaintive, passionate, joyous—ranging over the entire scale of human emotions. Strains from David's harp, Solomon's singers, and Oriental composers blend with selections from Beethoven, Mendelssohn, Mozart, and original melodies of the gifted cantor himself.

Chief Rabbi Jacob Joseph is the spiritual head of eighteen large congregations in the lower part of the city. These are mainly composed of Slavonic Jews, once wont to look upon long gabardine, beard, and corkscrew curls as tokens of orthodoxy. That they do not now is due to Russian zeal, which stripped the wearers of these characteristics as part of the Christianizing process, and distressed them into the superstitious belief that with the loss they had been bereft of their religion. They are not the first of the human family who have confounded religion with clothes.

Some congregations ranking as orthodox deviate from the ancient standards in a few unimportant particulars, such as delegating those portions of the holy-day services that were formerly said aloud by the entire congre-

THE ABODAH.

CONFIRMATION — TEMPLE EMANU-EL.

gation to the choir, which sings or chants them, or to the minister, who declaims them. The honorable service of taking out of and replacing in the ark the scrolls of the law is also confided exclusively to the wardens. The Haphtorah, or selection from the prophets, and prayer for the government, are read in English. The Pentateuch, or Torah, as in all orthodox congregations, is divided into fifty-two sections, so that the whole is read once a year; while among the reformers it is so arranged as to be read through once in three or five years.

Conservative Judaism believes in the divine origin and authority of the Old Testament, and follows good common sense in its interpretation. It seems to be largely due to the teaching of Mendelssohn, of whom it is said, "From

Moses (the lawgiver) to Moses (Mendelssohn) there never arose one like Moses (Maimonides)." Its assertion of the right of private judgment logically induced all the amazing changes which ensued.

Representatives of this school, or rather tendency, like the late Dr. Adolph Huebsch and the living Dr. Henry S. Jacobs, have happily succeeded in harmonizing discordant elements among their people for the accomplishment of communal purposes. Orthodox Jews hold to ancestral traditions, time-honored rituals, established synagogal customs, and rabbinical consensus of doctrine. Conservatives permit changes in synagogal customs, and also English additions to the ritual. Reformers reject all traditions, adopt any ritual they please, rather discountenance Hebrew prayers, allow any change in synagogal custom, adopt family pews in which the sexes sit together, admit Christian choristers into their choirs, and reject certain doctrines received by the orthodox. The Kaddish, or prayer in memory of the dead, is often in English instead of Hebrew. Some of the reformers, having neither the faith nor the practice of orthodox or conservative Jews, repudiate circumcision,

intermarry with Gentiles, set aside the difficulties which orthodox rabbis always regard in the case of proselytes to Judaism, institute Sunday services, or, like Dr. Hirsch of Chicago, also close the place of worship on Saturdays, keep none of the food laws, reject much of the Bible, more of Judaism, all of Christianity save its spirit and ethics, and occupy the position of polished rationalists. They have abolished the rabbinical second-day festivals as being unnecessary, and substituted English for Hebrew hymns. They revere the Old Testament as the divine source of law and doctrine, but decline to acknowledge the supremacy, if not the authority, of the Talmud. In the Prayer-book of the Temple Emanu-El, the liturgy is scriptural, beautiful, appropriate, and free from the

FEAST OF TABERNACLES.

redundancies, repetitions, dogmatisms, and unintelligibilities of many medieval Minhagim.

Not without conflict, sharp and protracted, was reform, to any noteworthy extent, achieved. The rabbinate was subtly hostile, and the power of prejudice stubborn. Notwithstanding these, the movement was largely successful. Piyutim, Kinoth, and Selichoth,¹ prayers of uncertain origin and doubtful utility, coming down from the middle ages, were in many instances extruded as forming no part of the Common Prayer-book compiled by the 120 pious and learned men, among whom were Ezra and his contemporaries, known as the "Men of the Great Assembly," and as foreign to existing so-

cial conditions. Few, if any, of the many Jewish Prayer-books are generally acceptable. The Sephardic, or Spanish and Portuguese, is singularly free from the objectionable compositions of poetasters. It has been suggested that a model Prayer-book might be formed by retaining only what is common to the Sephardic and the Ashkenazic, or German, ritual.

Worship has been gradually modernized by the introduction of pulpit oratory, clerical robes, and the ordinary accessories of public devotion, such as had long been in vogue with cultured congregations. Confirmation of boys and girls alike has also been adopted. In 1845 Dr. Leo Merzbacher led the van in New York, where his adherents form the congregation Emanu-El.

Whether the mass of the unorthodox are reformers or secessionists, as their opponents

¹ Piyutim is the Hebrew form of the Greek poetries; Kinoth are lamentations; Selichoth are penitential hymns.

claim, is not a question demanding settlement here. The Rev. Dr. Wise of Cincinnati affirms their belief in the following doctrines of orthodox Judaism—the immortality of the soul, future rewards and punishments, perfectibility of human nature, and the final and universal triumph of truth and righteousness. But the Messiah they do not expect, neither the gathering of the Hebrew people in Palestine, nor the restoration of the Levitical ritual. The resurrection of the body, the last judgment, the evidence of miracles to the divinity of the Holy Scriptures, and the objectivity of angelic and theanthropic appearances are all discarded as unworthy of belief. Their hermeneutics are rationalistic. All religious doctrines, they maintain, must be taken from the Bible, must be in harmony with the loftiest and purest conceptions of the Deity suggested by the Scriptures, and must be confirmed by reason and conscience. In respect of law, they hold that the

vices within the city of New York; but whether this number included the whole, and especially those temporarily organized in the Jewish sections, or permanently established in eleemosynary institutions, admits of doubt. It certainly did not embrace the special congregations assembled on the high holidays. Thirty organizations worship in consecrated buildings, or in institutional rooms fitted up for that purpose. In one hundred and twelve halls “chevras” (brotherhoods) meet for business and devotion, and also assemble in scores of other resorts the names and localities of which are not definitely ascertained.

The smallest number that may constitute a “Minyan,” or religious congregation, without which no public ceremony or worship is performed, is ten. These must be males (*benai mitzvah* over) thirteen years of age who have

SHOPHAR.

Decalogue, in letter and spirit, is obligatory forever. “All laws not contained in the Decalogue, expressed or implied, are local and temporal (although the principle expressed by some may be eternal), and could have been intended for certain times and localities only.” In New York, and throughout the United States, the organization, laws, customs, and doctrines of the Jewish congregations are as diversified as those of the Congregationalists. Visionaries, enthusiasts, fanatics even, relicts of the bad times in which diabolism rioted, and in which cabala and mysticism won many and close disciples, are common among the Jews as among the Christians. Both are Adamic.

Radical reformers like Felix Adler, Lasalle, and Bebel are by some denied the right to the title of Jew or Christian, and are consigned to a mystical limbo whence they may or may not eventually emerge into everlasting light, love, and liberty. For anarchists a warmer future is probably waiting.

The synagogues in which all this weltering chaos of opinion finds more or less of articulate voice are chiefly of Byzantine architectural characteristics—striking bits of Semitism translated from dreamy Orient to practical Occident. Those of the reformed are styled temples; of the orthodox, schools or synagogues. There is not, it is said, a complete list of Jewish congregations in existence. One hundred and forty-six were reported in the winter of 1890–91 to be duly organized and holding regular religious ser-

been confirmed. Wherever the praying assembly convenes is sure to be found the perpetually burning lamp, according to the Aaronic law (Exodus xxvii. 20, 21), whose beaten oil typifies pure revealed truth, correct exegesis, and genuine morality. Should any Jew become Christian, his orthodox brethren of Slavonic antecedents are said to insist that his features assume a “goyish,” or Gentile, cast.

Physiognomy, however, is not an infallible index to theological creed, for many of the best class of cultivated Hebrews seem to have parted with most, if not all, signs of Semitic origin. This may be due to ancestral intermarriage with Gentiles, which rabbinism has always discouraged in the effort to differentiate its disciples from other believers. Traditional observances in respect of meats and drinks, culinary and domestic utensils, are also intended, among other objects, to perpetuate the distinction.

The Jewish creed is embodied in the thirteen articles formulated by Moses Maimonides, one of the noblest and most influential men of his race. They were drawn up in the abiding belief that all men will eventually become Jews, not in the spiritual sense of St. Paul (Romans ii. 28, 29), but in that of the orthodox traditionalist. The twelfth article is a petition for the advent of Messiah. Moses Mendelssohn, scarcely less venerated than Maimonides, was instrumental in elevating the majority of his people to that phase of Judaism popularly known as Conservatism—

perhaps to reform. Traditionalism and democracy blend in the worship of an orthodox Jewish synagogue. That worship, if normal, is daily — morning and evening. Extra sessions are held on special occasions. All worshipers are equal before God. The rabbi owes his influence not to ordination or official position, but to tried probity, superior learning and piety, excellency of legal exegesis, and power of spiritual advice. In these respects he is *Rab, Rabba*, or *Rabban*, — that is, Master, — but in no sense is he the equivalent of a modern priest. The Slavonic dignitary is a picturesque object. Profile is distinctively Semitic. Orientalism is positive and piquant. Prayer is a duty and delight, and its outpourings are in terms of accepted ritual.

Worship ought to be supremely intelligent. The tallith, with its horizontal stripes of blue or purple and skilfully knotted "tsitsith," or fringes, fastened to the four corners, testifying by peculiar mode of attachment that "the Lord is one," reminds of the obligations of the law (Numbers xv. 37-41). The "tephillin shel rosh," in the shape of a cube of parchment attached to a leathern chaplet, and the "tephillin shel yad," in similar form attached to a thong which compasses the arm seven times and runs three times around the middle finger, are worn in obedience to the command that they shall be "for a sign unto thee upon thine hand, and for a memorial between thine eyes" (Exodus xiii. 9-16). "These cubes contain four portions of the Bible, teaching the four cardinal creeds of orthodox Judaism: (1) the unity of God; (2) that 'virtue brings its own reward,' but 'the wages of sin is death'; (3) the religious duty of spiritual education; (4) the restoration to Palestine, which means the realization of Messianic hopes or ideals — such as cessation of war and settlement of international disputes by arbitration, the settlement of social questions and institution of universal brotherhood, and Jerusalem a center where all nations shall be free to worship God."¹

The "tephillin," or phylacteries (Deuteronomy vi. 8), are for use in matutinal devotions, but not on Sabbaths or religious festivals. Women and males under the age of thirteen are, for practical and sufficient reasons, exempt from the use of tallith and tephillin. Whether the worship be in spirit and in truth, and to what extent it issues in the negative and positive morality required by the law, is best known to the God and Father of us all. It is unquestionably demonstrative, and intended to express normal religious thought and feeling. The trend of Jewish thought, literary and religious, is toward a yet undefined unity. Cross-currents intersect the main streams of orthodoxy, conservatism, and reform. What the

issue will be, and what its relations to Christianity, are questions about which opinions necessarily differ, while all concur in the conclusion that they will be of vastly higher order than anything manifested by the past.

For the observance of festivals and fasts the Jews of New York are conspicuous. Of the festivals, those of the Passover, Weeks, and Tabernacles, together with New Year's day and the Day of Atonement, are of divine institution (Exodus xxxiv. 23). Of the minor festivals Purim is of Biblical, and Chanukah of post-Biblical origin. The fasts, with the exception of Yom Kippur, are of rabbinical institution, and include those of Tammuz, Ab, Gedaliah, Tebeth, and Esther. All originate in epochs of history. Passover, Pentecost, and Tabernacles are held to be in manifest connection with corresponding seasons of the year. Modern rabbinical teachers, thinking less of the historical than of the natural elements in these festivals, lay greater stress upon the latter. On the New Year the creation of the world is called to mind, and God as Creator is specially glorified. The weekly Sabbath, in addition to other uses, is a perpetual remembrance of the same great fundamental event.

Following chronological order, the series begins with "Rosh Hashshana," the New Year, the first day of which in 1890 fell on the 15th of September. Evidence of the strong hold which this holy day has upon the Hebrew affections in New York, and indeed all over the world, is obvious in the preparations made for its observance. As beginning the civil year it bears the title of Rosh Hashshana; as the day of memorial, Yom Hazikkaron; and as the day of judgment, Yom Hardin. Special and suitable prayers are repeated; and the "shophar," or cornet, is sounded in the synagogue to rouse the sluggish to the performance of religious duty, and preparation for the Day of Atonement, by means of penitence, fasting, and charity, in which the contrite seek to make themselves "worthy of the mercy of God" (Numbers xxix. 1; Psalms lxxxi. 3, 4). The cornet is of ram's horn, in allusion, as the rabbis fancy, to the animal sacrificed by Abraham on Mount Moriah. One interesting specimen of the shophar, in possession of the family of the New York owner for more than a century, has been shaped by ingenious process into its present form and length of nineteen inches. Along its sides are engraved in Hebrew characters:

"Happy are they who know the joyful sound. In the light of His countenance shall they walk."

Anthropomorphism has something to do with the notion that New Year's day is also the Day of Judgment, and that then all persons stand before the Lord for judicial decision upon their

¹ From statement by Rev. H. Pereira Mendes, D. D.

actions during the past twelve months. Rabbi Jochanan asserts that on Rosh Hashshanah three books are opened. One is for the righteous, who are immediately inscribed for life; one for the wicked, who are instantly inscribed for death; and one for the nondescript, who are

the subject, and to constitute the basis on which survivors, as also the Almighty, will inscribe him for life or for death. The ten penitential days, on the third of which is the Fast of Gedaliah (2 Kings xxv. 25), begin with the first day of the New Year, continue until after

FAST OF AB.

left on probation. If the latter repent during the ten penitential days between this and Yom Kippur, the Day of Atonement, their names are written in the book of life; if not, in that of death. This representation, couched as it is in Oriental metaphor, is an impressive lesson on the need of true repentance.

That the chief duty of worshipers on this day is to review their actions during the past year and to amend their conduct is clear enough; but that, as the Rev. Dr. Kohut remarks, the infinite God once in a year assumes the rôle of head bookkeeper and converts the heavens into a census bureau, "keeping an account of a few million Israelites who are no more than a grain of sand at the seashore," is a superstition no less blasphemous than ignorant. In the estimation of this eloquent and erudite clergyman every man keeps a faithful and correct diary of his own life, whether he wishes to do so or not, and this record, rarely perused in life, is sure to be studied after the decease of

the Day of Atonement, and occupy similar relative position in the sentiment of many Jews that Lent holds in that of liturgical Christians, or the yearly camp-meeting in that of many Methodists. That it is better to be good part of the time than not to be good at all is the deep underlying conviction of irregular Jews who attend synagogal services on the first ten days of the year—and that often at considerable cost to themselves—and neglect public worship all the rest of the period. Salvation by merit of work done is consciously or unconsciously sought by such, while others urge that mere work without sincerity is only multiplying sin by hypocrisy.

Yom Kippur, the White Fast, or Day of Atonement (Leviticus xxiii. 26 *et seq.*), coming ten days after Rosh Hashshanah, celebrates the grace of God in providing pardon for the transgressions that mar and corrupt creation. It begins at sunset and lasts until the appearance of three stars in the heavens on the even-

PROCESSION OF THE SEPHARIM.

ing of the next day. The synagogue services in Zichron Ephraim are unusually impressive. The heart-broken, passionate plaints of "Kol Nidre," or the confessional supplication, are in music that penetrates the whole being, and is the same among all the children of Jacob. Males crowd the floor, females fill the gallery. The ritual is Ashkenazic, and the rabbi charms by his full, rich vocalization. His extemporary English prayer is an ideal of intelligent devotion. Reverence is less marked than in reformed assemblies, yet all join in the responses. Some tarry after the close of worship, and persist in repetitious prayers, somewhat obtrusive, and to a

non-Jew not agreeably emphasized by the circular white caps, talliths, and funereal shrouds in which the supplicants are enveloped. A cultivated critic of identical faith smilingly speaks of them as the "elect," and predicts their prominence on the morrow. Zeal is pronounced, but somehow jars on the spirit, and is in discord with the chastely elegant symbols that are spread upon the walls. Behind the perpetual lamp, inscribed on the pure-white marble, are the ten commandments. Through law to life, love, and light everlasting is the lesson of this sacerdotal interior.

Throughout all the ensuing day religious

exercises in the synagogue continue. Neither eating, drinking, nor sleeping is thought of, the aim of each suppliant being to "make the spirit more free, inward, and holy than at any other time." Men and boys do not leave the building. Children under thirteen years of age visit them. Bright-eyed girls, particularly, come and go with messages of love or duty too urgent in their claims to brook delay. In many synagogues, however, this is not allowed.

Synagogues, as we discover in perambulation of the city, are improvised in various parts thereof, as need or convenience may require. Here, at No. 125 Rivington street, is the Golden Rule Hall. Five separate congregations worship on its five separate floors, and worship for twelve hours at a stretch. Crowds of young, middle-aged, and old go in and out, up and down the creaky stairs, in intermittent, unending streams. Grandsires gray, puling infants, tired women, and struggling men, to whom Yom Kippur is more than Sabbath, are all there for this one day out of the three hundred and sixty-five. Within each steaming room some men chat and some women gossip at intervals, children are sleepily quiet, and devotees in grave habiliments occupy the corners. Wild is the recitative of the chazan, nervous and exaggerated his gestures, while his voice is often singularly musical. Conviction speaks from the depths of his being, and passionate devotion in his vibratory tones. His memory is marvelous. Not a syllable escapes that of one blind patriarch. Sequence of notes in his lifelong chanting has given to repetition the precision of an organette.

All this is not less true of Rabbi Dr. Philip Klein, son-in-law of Dr. Sampson Raphael Hirsch of Frankfort-on-the-Main (the latter being in orthodox esteem one of the most learned rabbis in the world), and of Chazan Jacob Baer of the first Hungarian congregation, Ohab Zadeck, in Norfolk street. This numbers three hundred and fifteen paying male members, and of the orthodox is numerically the strongest in the United States. Two thousand souls at least are incorporated with it. Here the devotees in white garments aspire to the purity of angels, and all the more because they walk in the shadow of death, as is signified by the shrouds in which they expect to be buried. An alderman, a judge of the Fourth District Court, and a clerk of the same tribunal are among the worshipers.

Two of the scenes enacted in this sanctuary are altogether rememberable, viz., the "Abodah," and the blessing by the "Cohanim." Confession of sin is peculiarly appropriate to this holy day. So is supplication for forgiveness. Both are national rather than personal. Many times in the course of reconciliation with

an offended God do the penitents, robed in grave-clothes, prostrate themselves on the floor of the aisles whereon they stand. Prostrate themselves, we say — or rather on bended knees knock the forehead against the boards of the floor while imploring pardon. Nor are they at all reserved in acknowledgment of transgression, but are as remarkably explicit in mention of delinquencies as in recognition of the fact that good works only can build the edifice of hope in the wondrous mercy of the Most High. The ritual is said to be the one formerly repeated by the high priest in the temple at Jerusalem. The day is distinguished as the "Sabbath of Sabbaths," "rest of rests," whereon the high priest entered into the Holy of Holies, and there pronounced the ineffable name.

The blessing by the Cohanim is another spectacle that no stranger to the house of Israel who sees and hears its bestowal can forget. The Cohanim consist exclusively of the descendants of Aaron, the high priest, and usually bear the name of Cohen. Collecting in front of the ark, these first worship the God of their fathers, whose law and providence are written on the sacred scrolls within the revered receptacle. In pronouncing the priestly blessing each head is enveloped by the tallith, raised sufficiently by elevated and extended hands to admit of seeing the people. The fingers are triangularly adjusted. The middle is separated from the ring-finger. Three distinct openings or divisions of each hand are thus formed. With these, and with the three periods of human life,—infancy, virility, and decrepitude,—the three parts of the blessing correspond.

In conferring the blessing the body of the Cohen assumes a swaying motion, curiously harmonizing with the crooning of his voice. Gentiles may gaze upon the officiating Cohanim, but Jews may not. Attention of the priests must not be distracted in performance of duty. An orthodox metropolitan rabbi, born and brought up within sight of Trinity Church spire, declares that he has never looked upon this ceremony. Why it should not be studied is not matter of easy conjecture. Certain it is that many of the boys — as for the girls, that goes without saying — indulge in furtive glances, even when forbidden by fathers whose faces are turned the other way, and whose paternal discipline somehow implies occasional squints over the shoulder. Which, the group of Cohanim on the pulpit platform, or the absorbed artist intent on pictorial reproduction, is the object of greater curiosity to the women admits of doubt. The endurance of chazan and choir is astonishing. Rich, clear, sweet, and strong, their voices are seemingly unimpaired by length of service. The music is not less

remarkable. Curiosity and courtesy are both charming. Practical is their sympathy with unfortunate brethren, as shown in a special appeal on one occasion for distressed brethren in Salonica, for whose relief two-dollar subscriptions were sought by officials bearing boxes on which were Hebrew inscriptions, and who, in recognition of the charity, would enter the names of donors in the "book of life."

The joyous Feast of Tabernacles, Succoth, celebrating the divine mercy to Israel when dwelling in the wilderness booths (Leviticus xxiii. 43), begins five days after the Day of Atonement, lasts seven days, as ordained (Leviticus xxiii. 39), and is generally observed among the orthodox. The first two days only are regarded as holy days.

The "succah," or booth, is of generic shape, roofed with branches, and of endless diversity of construction. It may be domestic, or it may be communal. One erected in the rear of a house in the "Fifties" streets, ten by seven feet in superficial area, built of lath, with muslin sides, roofed with branches of different trees from which hung fruit of many kinds, including products known and unknown to the Sinaitic peninsula, may serve as a specimen of the private class.

In the rear of Zichron Ephraim is a structure of public order. Its top is obscured by foliage, its sides festooned with leaves and natural and artificial flowers, while pendent American vegetables, wine, and fruits, foreign and domestic, awaken gratitude to the All-Bountiful. Three chandeliers shed abundant light on the grateful who gather here after prayers on the first two days and nights, or on any subsequent evening of the festival. Those who cannot erect a succah at home may utilize this. Only the irreligious fail to avail themselves of the privilege. Obedient to the command (Leviticus xxiii. 40), a bouquet composed of palm-branches, boughs of myrtle, and willows of the brook, together with the fruit "ethrog" (citron) from the tree "Hadar," is held in the hand while prayer and thanksgiving are offered — the bouquet and fruit being first raised toward heaven and then lowered toward the ground.

Hoshanah Rabbah, the seventh day, is a "great day of the feast" (John vii. 37), when a procession is formed, and seven interior circuits of the synagogue are made. Every Israelite also provides himself with a bouquet of five slender branches of willow, freshly gathered from a brook-side. At the close of the service he knocks the leaves from the branches, and, if of the superstitious crowd, fancies that thereby he strips himself of all his sins. The intelligent simply intend to foreshadow the approach of winter, or, ethically, the casting off all evil habits.

Shemini Atzereth, the eighth day, is distinguished by thanksgiving for past and present benefits and by prayer for the blessing of rain to fructify the earth. It is among the orthodox, the traditional, that beliefs have crystallized into changeless forms. Forms may be only forms, observance obligatory, but not inculcative of spiritual truth. Again, it may be wholly otherwise. Whatever may be the facts with those who use the baths, "Mickvaoth" ("meetings of the waters"), in the basements or appurtenances of synagogues, it is at least plain that all the appliances of ceremonial purification are there.

Simchath Torah ("the rejoicing of the law") follows on the day after Shemini Atzereth, and is expressive of the gladness with which the participants have once more completed the reading of the law, and with which they have discerned and appropriated the moral and religious truths committed to its custody. In token of grateful joy is the procession of the "sepharim," supervised by the parnass, or president of the congregation, who honors certain persons by allotting to each one of the sacred scrolls to carry. The scroll is covered with mantle and adorned with breastplate, crown, and pointer. Rabbi and chazan head the procession, parnass and vice-president, together with official and unofficial members, follow. In some synagogues children carry United States flags, thus denoting the local patriotism of the Jewish church combined with obedience to the divine law. Ladies manifest their interest by distributing candy to the children downstairs after the ceremony. Three or even seven times does the joyous concourse pass around the synagogal interior, the bearers of the sepharim, or scrolls, being changed at the end of each circuit. During the periodic reading of the law, the fact that it was designed from the outset to be the precise guide of life is forcibly brought home to the sterner sex by calling first upon a Cohen, secondly upon a Levi, and thirdly upon five ordinary Israelites, and repeating the process until all the available panel is exhausted, to read or harken to the reading of its closing and opening words. He who has the honor of reading the end of the law is called the "bridegroom of the law"; he who has the honor of reading the first chapter of Genesis, which immediately follows, is called the "bridegroom of the beginning." Usage varies. In some schools all the Cohanim first, Levites second, and other Israelites third, are called up in batches for the same purpose, and also to repeat the benediction in concert. Such a call is considered to be an honor and privilege worthy of recognition by means of social and festive gatherings to which friends are invited. On dedications of buildings to divine worship the procession

of the sepharim is one of the characteristic features.

On the twenty-fifth day of Kislev (December 7 of 1890) is the first day of Chanukah, or the "Dedication," an eight days' festival annually observed by orthodox and liberal alike, and which commemorates the cleansing of the temple and the reconstruction of the sacrificial altar, after the Syrians had been driven out of Jerusalem by Judas Maccabæus. Kept strictly, with innocent family amusements and gathering of friends, especially on the last night, it recalls the memory of unflinching faith and splendid achievement on the part of heroic forefathers. So long as religious liberty was conceded, the civil oppression of tyrants was borne with patience; but when Antiochus Epiphanes undertook to lord it over conscience, he met with sternest resistance. Diabolical tortures were endured without a murmur. At length the "lion" in Judah was fully roused. The Asmonean priest-princes led compatriots to victory and independence. Popular joy shines in general illumination. That of the Jews at the restoration of temple services piously lighted "the lamps which were upon the candlestick." A jar of sacred oil, sealed with the ring of the high priest, and sufficient for one day's consumption, was discovered just when it was wanted. Miraculously enough, it lasted for eight days, in memory whereof this festival was instituted. Josephus styles it the "Feast of Lights"; St. John (x. 22) the "Feast of the Dedication" which Christ attended at Jerusalem. Its symbolism is of the triumph of truth, of liberty, of humanity. Not a Jew in Russia, Roumania, or Morocco but feels the power of this simple celebration to impart endurance and to inspire the confidence of ultimate redress.

In temple and synagogue the Jews of twenty centuries ago carried branches of palms or other trees, sang hymns of praise to the God of their salvation, postponed any mourning or fast until after its close, and joyfully lighted up houses of worship and residence, within and without, by lanterns and torches during its continuance. Maimonides declares that this illumination is in obedience to the orders of the scribes. The ordinary rule at that festival is to kindle one light at sunset of the first night, two on the second, and so on until the last night, when eight are burned. Care is taken to provide illuminant material that will last for half an hour. Oil lamps of silver or other metal, wax candles, even humble walnut-shells filled with oil and wick to burn the desired time, are used, as the pecuniary circumstances or tastes of the celebrants permit. Present at the house of a courteous Jewish gentleman, we see that the lights are all affixed to one holder. Hatted, as are all the males of his household, the females be-

ing uncovered, he recites the same prayer as that offered by the chazan who kindles the light at the beginning of worship in the synagogue. Prayer consists of three benedictions, of which the third—"Blessed art thou, O Lord our God, King of the universe, who hast preserved us alive, sustained us, and brought us to enjoy this season"—is used only on the first night. The first benediction refers the origin of this ceremony to God, who "commanded us through our sages to light the lamp of dedication." All the lights are held to be consecrated, and may only be looked upon, but not put to other use. Touchingly beautiful is the historic hymn, sung to resonantly triumphal music by the participants. Its pathos is that of prolonged suffering. Its petition is, "Reëstablish thy house of prayer, and there will we offer thanksgiving offerings," "then will we accomplish with song and psalm the dedication of the altar." New York contains Jews of all shades of religious opinion, and there are among its citizens a few who honor the injunctions of certain of the sopherim, or scribes, by kindling as many lights as there are inmates of the house, and adding a light for each person every night.

Jewish fasts are very impressive affairs when observed in spirit and letter of ordination. That of Tebeth, early in January, recalls Nebuchadnezzar's siege of Jerusalem; that of Esther, in March, the imminent peril of the Jews from the decree of Czar Ahasuerus, and the wondrous deliverance which came through the address of the charming Hadassah. The Persian Ignatieff, Haman, the son of Hammedatha, was no match for the witchery of her beauty and the profound wisdom of Uncle Mordecai. The romantic story of her brilliant services is familiar to childhood and age, from regular reading in the synagogue, rejoicing at home, exchange of gifts, and presents to the poor, as is that of the Christ-child's birth at Christmas to modern Christians.

The feast of Purim, or lots, follows on the day after the fast of Esther, and lasts forty-eight hours. Judaism then shakes a free foot. Festivity is the order of social life. Hellenism lends its songs, masques, fancy dresses, and exuberant merriment for the occasion. Wealth, culture, and fashion disport themselves in great public balls like the one held in the magnificently decorated Metropolitan Opera House on February 26, 1891. Net proceeds of terpsichorean saltations swell the receipts of hospitals or other worthy charities to the extent of many thousands of dollars. Rabbinical genius does not disdain the composition of Purim plays and tableaux, accompanied by instrumental and vocal music, *delicatessen* for the children, and dancing for the older folks.

Pesach, or Passover, celebrated at Eastertide, is a festive season of obligatory observance,

historically commemorating the transit of the Benai Israel from Egyptian slavery to nomadic freedom. As such it begins the ecclesiastical year. Emblems employed in this ceremonial are the four cups of wine, the bone of a lamb, unleavened bread, and bitter herbs. Dr. K. Kohler, Rabbi of Temple Beth-El, speaking of the "four cups of the Passover," teaches that the first is that of cheerfulness, bidding farewell to "frost" as he passed the tent, and welcoming the spring. The second represents liberty, which is "power for greatness and goodness." The Jew, so "sensitive to social injustice and class prejudice," craves, more than the rest of mankind, a broad, cosmopolitan religion, because his prophets and poets declared it to be the basis of all freedom, and his saints and sages have given their lives a ransom for it. "Israel's Passover offers liberty while pointing to God, who lives in all as the universal Redeemer." It upholds the doctrine of human rights and of that political equality which found expression in the declaration, "One law for yourselves, for the stranger and sojourner in the land." The lamb-bone, roasted, represents the paschal lamb; while an egg, roasted with fire, is used in memory of the Karban Chagigah, or festive sacrifice offered in Jerusalem. The "matzoth," or unleavened cakes, keep alive the memory of deliverance from Egypt, as the "maror," or bitter herbs, do of the precedent bondage.

Modes of observing the Passover necessarily differ in a Hebrew aggregate so diverse in its particular elements as that of New York. In most families the memorials of the miraculous past are placed on the table, and, after more or less of prescribed prayers, are removed to make way for a course-dinner in which the fine arts of cooking and courtesy to guests blend in smiling harmony. Psalms and hymns of remarkable musical beauty conclude the evening. Reformers observe the first and the seventh day; the orthodox hold sacred the first two and the last two of the eight days, and devote the intervening four to secular duties.

It is of the orthodox—that of the Jew of history, in his own estimation—that search through the house for leaven, and gathering the suggestive ferment as it lies in his way, is expected on Erev Pesach, the evening ushering in the fourteenth day of Nisan. Neither leavened food nor fermented liquors may be used during the feast (Exodus xiii. 7; Deuteronomy xvi. 3, 4). About 10 A. M. on the fourteenth he burns the leaven. If absent from home, he simply annuls the leaven by accounting it as the dust of the earth. On the day before Passover the first-born fasts in memory of the death of Egypt's first-born; or, if not old enough, the father fasts for him.

Costly furniture and plate, holiday garments, and cushioned seat of *paterfamilias* contrast violently with the ancient serfdom, while the presence at table of every domestic of the Jewish faith is a memento of the old equality in toil and misery. Every one is obliged to drink of the four cups of wine, and all take part in the liturgical service. Washing the hands is followed by distribution of parsley dipped in vinegar or sprinkled with salt and water, breaking by the host of the middle "matzah" in the pile of three Passover cakes, and general touching of the dish containing the lamb-bone and egg. After removal of the latter from the table, the youngest in the company asks for the reasons of this celebration, and receives a curious account of the Pharaonic slavery and the miraculous deliverance. The matzah in the dish is exhibited as a memorial of freedom; the lettuce or horse-radish, of bondage. After eating the bitter herbs dipped in "charosheth," a compound of almonds, apples, and other fruit, emblematic of the Egyptian lime and mortar, the master of the household again distributes biscuit and wine, and all unite in responsive thanksgiving. Provision is made for the entertainment of the prophet Elijah in case he should appear to announce the coming of Messiah. The door ajar and the watchful attendant attest the readiness for the prophet's welcome. The custom of opening the door is also a public invitation to Christians to enter and see for themselves that no blood is used for the Passover, and to give the lie to the monstrous charge of child-murder which unchristian Christianity in Greek, Roman Catholic, and some Protestant countries makes against the Jews. The Hallel (Psalms cxiii. - cxviii.) is then repeated, the fourth cup of wine drained, and the whole ceremony held to be as acceptable to God as the actual offering of the Passover lamb.

Between the recital of the Haggadah and the closing hymns of joy and gladness at the Seder, the bounteous supper is enjoyed, hilarity is universal, but excess is avoided. Temperance is a Jewish characteristic. Contrast adds to the merriment, as when a child succeeds in abstracting the piece of matzah hidden by the father under the cloth or behind the pillow on which he reclines. Dr. De Sola Mendes believes that the celebration of the festival as thus described is the one most in vogue in New York.

Counting of the Omer (Exodus xvi. 16) begins on the second day of Pesach, continues for seven weeks, and closes at the feast of Pentecost. Lag Baomer (the scholar's feast) intervenes on the thirty-third day, but is of minor importance.

Shebuoth, the Feast of Weeks, or Pentecost, is the anniversary of the giving of the

law at Mount Sinai, fifty days after the exodus. All the previous enumeration signifies the impatient desire with which this inestimable boon was anticipated. David is not the only Israelite whose estimate of the law is that of the One Hundred and Nineteenth Psalm. This festival also bears the title of Chag Haqqatsir, or Feast of Harvest (Exodus xxiii. 16), and of Yom Habbikoorim, or day of first fruits (Numbers xxviii. 26), when an offering of two cakes made of the new wheat was brought by the Israelites. Its chief distinction is, however, that of commemorating the gift of that wondrous legal code in A. M. 2448, of which the Israelites were made the depositaries, and which became the enduring basis of religion, law, and morality throughout progressive civilization.

The reformed Jews especially honor this day by the confirmation of youth,—boys and girls alike having been prepared for the ceremony,—and that with so much care and display as to convert it into the most attractive feature of their ecclesiastical life. Both sexes, of proper age, are publicly catechized on the character and extent of their religious knowledge, and solemnly admitted to all the rights and privileges of the church. Each catechumen is considered as bearing God's likeness, proceeding "in a state of purity and sinlessness from the Creator," "but whilst on earth, and joined to the body, subject to trials and liable to sin." Obligation "towards the propagation of right, light, and truth" is permanent.

Confirmation is public assumption of covenant vows previously made by natural sponsors. Anything more impressive and spectacular than the assumption which annually occurs in the Reformed Temple Emanu-El, on Fifth Avenue, New York is rarely witnessed. The gorgeous Byzantine edifice, esthetically decorated, and radiant with tropical fragrance, is always crowded with the *élite* of Jewish society. The scene is beautifully, touchingly dramatic. Hearts parental and friendly thrill with unwonted emotion as boys and girls emerge from the underlying school-rooms, and to the strains of Gounod's choicest music march up the aisles to the platform occupied by Rabbis Gottheil and Silverman, and there assume the vows which bind them to ancestral faith and polity. Each has been under stated religious training for six or eight months, studied a summary of the Jewish faith, and recites the part assigned in the Hebrew or in the English tongue. In 1890 one of the girls, with admirable elocutionary skill, answered the question, "Who is thy neighbor?" in familiar words fraught with tremendous meaning:

"Who is thy neighbor?" He whom thou
Hast power to aid or bless;

Whose aching heart or burning brow
Thy soothing hand may press.
Thy neighbor? Pass no mourner by;
Perhaps thou canst redeem
A breaking heart from misery;
Go, share his lot with him.

"We must not return evil for evil, but try to overcome it with good," is a sample of metropolitan Jewish ethics. Both sexes avow the belief that "God has elected Israel to be the people of this covenant, and keeper of the true religion," and pledge themselves to lives in keeping with this dogma.

Interest culminates when the rabbi throws back the doors of the ark behind the pulpit, revealing the sacred scrolls of law and prophecy. Electric light floods the interior with golden glory, while overhead beams the ever-burning lamp. Between ark and minister passes the long string of catechumens, while on each head in succession his hand rests in priestly, paternal blessing. Tears suffuse the eyes of the sensitive as to the minor music of Handel's *Largo* they slowly wend their way to the family pew, where proud and sympathetic parents await the loving kiss before the one who presses it upon their lips bends in adoring prayer.

Not a little sarcasm is bestowed by orthodox critics upon the entire ceremony. It is too much a matter of tinsel and show, of elegant dresses and costly presents, they say, while the shaping of intellectual and religious life in concord with Jewish standards is comparatively neglected. It is true that there is not much of the traditional and Talmudical about it, but it seems to embody all that is essential in Old Testament ethics.

The fast of Tammuz in July is a mournful remembrance of the overthrow of the walls of Jerusalem, capture of the city, siege of the temple, cessation of the daily sacrifices, and burning of the Torah scrolls by the conquerors—all of which happened on this day of the year. This black day is in future, like the other minor fasts, to be a bright one (Zechariah viii. 19).

Between the fast of Tammuz and that of Ab (on the 27th of July, 1890) all marriages and festivities were rabbinically interdicted. The latter begins at sundown, and commemorates the two destructions of the Jewish temple, first by Nebuchadnezzar, A. M. 3338, and secondly by Titus, A. M. 3828, on the same day of the year. It is emphatically the "Black Fast." Ark, pulpit, reading-desk, and table of the synagogue Shearith Israel are all clothed with crape. Lights, electric or gas, remain unkindled. Wax candles make darkness visible. Each in its small candlestick ordinarily suffices for two persons. Retaining head-gear so as to resemble "our people," observers es-

cape notice. The assembly is not large. Most of the regular congregation are rustivating, or recuperating by the sea-shore. The minister, Rev. Dr. H. Pereira Mendes, under silk hat and in satin gown, leads the prayers. Worship with head covered is the rule here, as in all orthodox and conservative synagogues, because God commanded Aaron to perform divine service with covered head (Leviticus xvi. 3, 4), or more probably because it is a survival of Eastern custom. Liturgy is in Hebrew, and from the Minhag of Sephardic orthodoxy. Service lasts seventy-five minutes. To an ordinary onlooker more contented mourners over two great catastrophes could not be collected. Grief is not in the mien, nor in the voice, but is poignant in the prayers. Weird is the scene, and weird are the figures, in the flickering gleam of the candles. The congregation evidently prefers the glory of sunrise to the night of darkness. Why should they not? Out of ancestral sorrow has come, and will come, unspeakable gladness. Rabbi Akiba laughed when he saw a fox spring out of the ruins of the holy city; for while it fulfilled inspired prophecy it was presumptive proof of divine fidelity to promise.

Historically the Black Fast proves that the events commemorated did really occur. Physically, in the experience of rabbi and chazan, and a century, more or less, of coreligion-

ists, it is a positive fact rooted in consciousness. From 7 P. M. to 11.30 A. M. the worship continues, to the weariness of the flesh and the edification of the spirit. Delightful change comes with the afternoon. The black hangings have been removed, and all signs of grief have disappeared. Pathetic threnodies are exchanged for chants of quiet joy, consolation, and blessing. The centuried measures familiar to Levantine, Oriental, and African—melodies by which the ritual is splendidly intoned—fail to hold attention at proper pitch during the long morning service. Dirges are less to modern taste than thanksgiving psalms.

The face of the Jew is toward the future, but whether that future will bring repatriation is a matter of indifference to the reformer. He wills none of it. "New York is my Jerusalem," he says. "The United States of America is my country. In fact, my Jerusalem is wherever I am doing well. I don't want to go to Canaan, and would not if I could." But such as he are few in comparison with the orthodox, who devoutly pray for restoration to the paternal hills and vales. Even if temporal interests should hold them among the diaspora, they still pray in the interests of humanity for Israelitish autonomy, and believe that it will be brought about because predicted by Isaiah (li. 3, lx.) and other inspired seers. A good many Americans are of the same opinion.

Richard Wheatley.

MILAN CATHEDRAL.

COMPLETE as if created, with the brand
 Of God, not man, upon the marvelous whole!
 Temple of Milan, thou hast thrilled my soul
 As hath no other work of human hand.
 Not that there be not monuments as grand
 Of human strength and wealth, but that the grace
 Of Heaven hath settled on thy fair white face—
 The harmony of things divinely planned.
 The moon dawns. Still I linger 'neath thy walls—
 White ivory, not marble, in such light,
 And blossomy with carving, where it falls
 With the full shine, which lifts the veil of night.
 This is God's house. I feel his mighty breath,
 And hear his music, though no words he saith.

Douglas Sladen.

THE NAULAHKA.¹

A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

VII.

COMMON rest-house in the desert is not overstocked with furniture or carpets. One table, two chairs, a rack on the door for clothing, and a list of charges, are sufficient for each room; and the traveler

brings his own bedding. Tarvin read the tariff with deep interest before falling asleep that night, and discovered that this was only in a distant sense a hotel, and that he was open to the danger of being turned out at twelve hours' notice, after he had inhabited his unhomely apartment for a day and a night.

Before he went to bed he called for pen and ink, and wrote a letter to Mrs. Mutrie on the note-paper of his land and improvement company. Under the map of Colorado, at the top, which confidently showed the railroad system of the State converging at Topaz, was the legend, "N. Tarvin, Real Estate and Insurance Agent." The tone of his letter was even more assured than the map.

He dreamed that night that the Maharajah was swapping the Naulahka with him for town lots. His Majesty backed out just as they were concluding the deal, and demanded that Tarvin should throw in his own favorite mine, the "Lingering Lode," to boot. In his dream Tarvin had kicked at this, and the Rajah had responded, "All right, my boy; no Three C.'s then," and Tarvin had yielded the point, had hung the Naulahka about Mrs. Mutrie's neck,

and in the same breath had heard the speaker of the Colorado legislature declaring that since the coming of the Three C.'s he officially recognized Topaz as the metropolis of the West. Then, perceiving that he himself was the speaker, Tarvin began to doubt the genuineness of these remarks, and awoke, with aloes in his mouth, to find the dawn spreading over Rhatore, and beckoning him out to the conquests of reality.

He was confronted in the veranda by a grizzled, bearded, booted native soldier on a camel, who handed down to him a greasy little brown book, bearing the legend, *Please write "seen."*

Tarvin looked at this new development from the heated landscape with interest, but not with an outward effect of surprise. He had already learned one secret of the East, never to be surprised at anything. He took the book and read, on a thumbed page, the announcement, "Divine services conducted on Sundays in the drawing-room of the residency at 7:30 A. M. Strangers are cordially invited to attend. (Signed) L. R. Estes, American Presbyterian Mission."

"They don't get up early for nothing in this country," mused Tarvin. "'Church at 7:30 A. M.' When do they have dinner? Well, what do I do about this?" he asked the man aloud. The trooper and camel looked at him together, and grunted as they went away. It was no concern of theirs.

Tarvin addressed a remark of confused purport to the retreating figures. This was plainly not a country in which business could be done at red heat. He hungered for the moment when,

with the necklace in his pocket and Kate by his side, he should again set his face westward.

The shortest way to that was to go over to call on the missionary. He was an American, and could tell him about the Naulahka if anybody could; Tarvin had also a shrewd suspicion that he could tell him something about Kate.

The missionary's home, which was just without the city walls, was also of red sandstone, one story high, and as bare of vines, or any living thing, as the station at Rawut Junction. But he presently found that there were living beings inside the house, with warm hearts and a welcome for him. Mrs. Estes turned out to be that motherly and kindly woman, with the instinct for housekeeping, who would make a home of a cave. She had a round, smooth face, a soft skin, and quiet, happy eyes. She may have been forty. Her still untinged brown hair was brushed smoothly back; her effect was sedate and restful.

Their visitor had learned that they came from Bangor, Maine, had founded a tie of brotherhood on the fact that his father had been born on a farm down Portland way, and had been invited to breakfast before he had been ten minutes in the house. Tarvin's gift of sympathy was irresistible. He was the kind of man to whom men confide their heart-secrets, and the canker of their inmost lives, in hotel smoking-rooms. He was the repository of scores of tales of misery and error which he could do nothing to help, and of a few which he could help and had helped. Before breakfast was ready he had from Estes and his wife the whole picture of their situation at Rhatore. They told him of their troubles with the Maharajah and with the Maharajah's wives, and of the exceeding unfruitfulness of their work; and then of their children, living in the exile of Indian children, at home. They explained that they meant Bangor; they were there with an aunt, receiving their education at the hands of a public school.

"It's five years since we saw them," said Mrs. Estes, as they sat down to breakfast. "Fred was only six when he went, and Laura was eight. They are eleven and thirteen now — only think! We hope they have n't forgotten us; but how can they remember? They are only children."

And then she told him stories of the renewal of filial ties in India, after such absences, that made his blood run cold.

The breakfast woke a violent homesickness in Tarvin. After a month at sea, two days of the chance railway meals between Calcutta and Rawut Junction, and a night at the rest-house, he was prepared to value the homely family meal, and the abundance of an American breakfast. They began with a watermelon,

which did not help him to feel at home, because watermelons were next to an unknown luxury at Topaz, and when known, did not ripen in grocers' windows in the month of April. But the oatmeal brought him home again, and the steak and fried potatoes, the coffee and the hot brown pop-overs, with their beguiling yellow interiors, were reminders far too deep for tears. Mrs. Estes, enjoying his enjoyment, said they must have out the can of maple syrup, which had been sent them all the way from Bangor; and when the white-robed, silent-moving servant in the red turban came in with the waffles, she sent him for it. They were all very happy together over this, and said pleasant things about the American republic, while the punka sang its droning song over their heads.

Tarvin had a map of Colorado in his pocket, of course, and when the talk, swinging to one part of the United States and another, worked Westward, he spread it out on the breakfast-table between the waffles and the steak, and showed them the position of Topaz. He explained to Estes how a new railway, running north and south, would make the town, and then he had to say affectionately what a wonderful town it really was, and to tell them about the buildings they had put up in the last twelve months, and how they had picked themselves up after the fire and gone to building the next morning. The fire had brought \$100,000 into the town in insurance, he said. He exaggerated his exaggerations in unconscious defiance of the hugeness of the empty landscape lying outside the window. He did not mean to let the East engulf him or Topaz.

"We've got a young lady coming to us, I think, from your State," interrupted Mrs. Estes, to whom all Western towns were alike. "Was n't it Topaz, Lucien? I'm almost sure it was."

She rose and went to her work-basket for a letter, from which he confirmed her statement. "Yes; Topaz. A Miss Sheriff. She comes to us from the Zenana Mission. Perhaps you know her?"

Tarvin's head bent over the map, which he was refolding. He answered shortly, "Yes; I know her. When is she likely to be here?"

"Most any day now," said Mrs. Estes.

"It seems a pity," said Tarvin, "to bring a young girl out here all alone, away from her friends — though I'm sure you'll be friends to her," he added quickly, seeking Mrs. Estes's eyes.

"We shall try to keep her from getting homesick," said Mrs. Estes, with the motherly note in her voice. "There's Fred and Laura home in Bangor, you know," she added after a pause.

"That will be good of you," said Tarvin,

with more feeling than the interests of the Zenana Mission demanded.

"May I ask what your business is here?" inquired the missionary, as he passed his cup to his wife to be refilled.

He had a rather formal habit of speech, and his words came muffled from the depths of a dense jungle of beard—iron-gray and unusually long. He had a benevolently grim face, a precise but friendly manner, and a good way of looking one in the eye which Tarvin liked. He was a man of decided opinions, particularly about the native races of India.

"Well, I'm prospecting," said Tarvin, in a leisurely tone, glancing out of the window as if he expected to see Kate start up out of the desert.

"Ah! For gold?"

"W-e-l-l, yes; as much that as anything."

Estes invited him out upon the veranda to smoke a cigar with him; his wife brought her sewing and sat with them; and as they smoked Tarvin asked him his questions about the Naulahka. Where was it? What was it? he inquired boldly. But he found that the missionary, though an American, was no wiser about it than the lazy commercial travelers at the rest-house. He knew that it existed, but knew no man who had seen it save the Maharajah. Tarvin got at this through much talk about other things which interested him less; but he began to see an idea in the gold-mining to which the missionary persistently returned. Estes said he meant to engage in placer-mining, of course?

"Of course," assented Tarvin.

"But you won't find much gold in the Amet River, I fancy. The natives have washed it spasmodically for hundreds of years. There is nothing to be found but what little silt washes down from the quartz rocks of the Gungra Hills. But you will be undertaking work on a large scale, I judge?" said the missionary, looking at him curiously.

"Oh, on a large scale, of course."

Estes added that he supposed he had thought of the political difficulties in his way. He would have to get the consent of Colonel Nolan, and through him the consent of the British Government, if he meant to do anything serious in the state. In fact he would have to get Colonel Nolan's consent to stay in Rhatore at all.

"Do you mean that I shall have to make it worth the British Government's while to let me alone?"

"Yes."

"All right; I'll do that too."

Mrs. Estes looked up quickly at her husband from under her eyebrows. Woman-like, she was thinking.

VIII.

TARVIN learned a number of things within the next week; and with what the West calls "adaptability," put on, with the complete suit of white linen which he donned the second day, an initiation into a whole new system of manners, usages, and traditions. They were not all agreeable, but they were all in a good cause, and he took pains to see that his new knowledge should not go for nothing, by securing an immediate presentation to the only man in the state of whom it was definitely assertable that he had seen the object of his hopes. Estes willingly presented him to the Maharajah. The missionary and he rode one morning up the steep slopes of the rock on which stood the palace, itself rock-hewn. Passing through a deep archway, they entered a marble-flagged courtyard, and there found the Maharajah, attended by one ragged and out-at-elbow menial, discussing the points of a fox-terrier, which was lying before him on the flags.

Tarvin, unversed in kings, had expected a certain amount of state from one who did not pay his bills, and might be reasonably expected to cultivate reserve; but he was not prepared for the slovenly informality of a ruler in his everyday garb, released from the duty of behaving with restraint in the presence of a viceroy, nor for the picturesque mixture of dirt and decoration about the court. The Maharajah proved a large and amiable despot, brown and bush-bearded, arrayed in a gold-sprigged green velvet dressing-gown, who appeared only too delighted to meet a man who had no connection with the Government of India, and who never mentioned the subject of money.

The disproportionate smallness of his hands and feet showed that the ruler of Gokral Seetarun came of the oldest blood in Rajputana; his fathers had fought hard and ridden far with sword-hilts and stirrups that would hardly serve an English child. His face was bloated and sodden, and the dull eyes stared wearily above deep, rugged pouches. To Tarvin, accustomed to read the motives of Western men in their faces, there seemed to be neither fear nor desire in those eyes—only an everlasting weariness. It was like looking at an extinct volcano—a volcano that rumbled in good English.

Tarvin had a natural interest in dogs, and the keenest possible desire to ingratiate himself with the ruler of the state. As a king he considered him something of an imposture, but as a brother dog-fancier, and the lord of the Naulahka, he was to Tarvin more than a brother; that is to say, the brother of one's beloved. He spoke eloquently and to the point.

"Come again," said the Maharajah, with a light of real interest in his eyes, as Estes, a lit-

tle scandalized, drew off his guest. "Come again this evening after dinner. You have come from new countries?"

His Majesty, later, carried away by the evening draught of opium, without which no Rajput can talk or think, taught this irreverent stranger, who told him tales of white men beyond the seas, the royal game of pachisi. They played it far into the night, in the marble-flagged courtyard, surrounded by green shutters from behind which Tarvin could hear, without turning his head, the whisper of watching women and the rustle of silken robes. The palace, he saw, was all eyes.

Next morning, at dawn, he found the King waiting at the head of the main street of his city for a certain notorious wild boar to come home. The game-laws of Gokral Seetarun extended to the streets of walled towns, and the wild pig rooted unconcerned at night in the alleyways. The pig came, and was dropped, at a hundred yards, by his Majesty's new Express rifle. It was a clean shot, and Tarvin applauded cordially. Had his Majesty the King ever seen a flying coin hit by a pistol-bullet? The weary eyes brightened with childish delight. The King had not seen this feat, and had not the coin. Tarvin flung an American quarter skyward, and clipped it with his revolver as it fell. Thereupon the King begged him to do it again, which Tarvin, valuing his reputation, politely declined to do unless one of the court officials would set the example.

The King was himself anxious to try, and Tarvin threw the coin for him. The bullet whizzed unpleasantly close to Tarvin's ear, but the quarter on the grass was dented when he picked it up. The King liked Tarvin's dent as well as if it had been his own, and Tarvin was not the man to undeceive him.

The following morning the royal favor was completely withdrawn, and it was not until he had conferred with the disconsolate drummers in the rest-house that Tarvin learned that Sitabhai had been indulging one of her queenly rages. On this he transferred himself and his abundant capacity for interesting men offhand to Colonel Nolan, and made that weary white-haired man laugh as he had not laughed since he had been a subaltern over an account of the King's revolver practice. Tarvin shared his luncheon, and discovered from him in the course of the afternoon the true policy of the Government of India in regard to the state of Gokral Seetarun. The Government hoped to elevate it; but as the Maharajah would not pay for the means of civilization, the progress was slow. Colonel Nolan's account of the internal policy of the palace, given with official caution, was absolutely different from the missionary's,

which again differed entirely from the profane account of the men in the rest-house.

At twilight the Maharajah pursued Tarvin with a mounted messenger, for the favor of the royal countenance was restored, and he required the presence of the tall man who clipped coins in the air, told tales, and played pachisi. There was more than pachisi upon the board that night, and his Majesty the King grew pathetic, and confided to Tarvin a long and particular account of his own and the state's embarrassments, which presented everything in a fourth new light. He concluded with an incoherent appeal to the President of the United States, on whose illimitable powers and far-reaching authority Tarvin dwelt, with a patriotism extended for the moment to embrace the nation to which Topaz belonged. For many reasons he did not conceive that this was an auspicious time to open negotiations for the transfer of the Naulahka. The Maharajah would have given away half his kingdom, and appealed to the Resident in the morning.

The next day, and many succeeding days, brought to the door of the rest-house, where Tarvin was still staying, a procession of rainbow-clad Orientals, ministers of the court each one, who looked with contempt on the waiting commercial travelers, and deferentially made themselves known to Tarvin, whom they warned in fluent and stilted English against trusting anybody except themselves. Each confidence wound up with, "And I am your true friend, sir"; and each man accused his fellows to the stranger of every crime against the state, or ill will toward the Government of India, that it had entered his own brain to conceive.

Tarvin could only faintly conjecture what all this meant. It seemed to him no extraordinary mark of court favor to play pachisi with the King, and the mazes of Oriental diplomacy were dark to him. The ministers were equally at a loss to understand him. He had walked in upon them from out the sky-line, utterly self-possessed, utterly fearless, and, so far as they could see, utterly disinterested; the greater reason, therefore, for suspecting that he was a veiled emissary of the Government, whose plans they could not fathom. That he was barbarously ignorant of everything pertaining to the Government of India only confirmed their belief. It was enough for them to know that he went to the King in secret, was closeted with him for hours, and possessed, for the time being, the royal ear.

These smooth-voiced, stately, mysterious strangers filled Tarvin with weariness and disgust, and he took out his revenge upon the commercial travelers, to whom he sold stock in his land and improvement company between

their visits. The yellow-coated man, as his first friend and adviser, he allowed to purchase a very few shares in the "Lingering Lode," on the dead quiet. It was before the days of the gold boom in Lower Bengal, and there was still faith in the land.

These transactions took him back in fancy to Topaz, and made him long for some word about the boys at home, from whom he had absolutely cut himself off by this secret expedition, in which he was playing, necessarily alone, for the high stake common to them both. He would have given all the rupees in his pocket at any moment for a sight of the "Topaz Telegram," or even for a look at a Denver daily. What was happening to his mines—to the "Mollie K.," which was being worked on a lease; to the "Mascot," which was the subject of a legal dispute; to the "Lingering Lode," where they had been on the point of striking it very rich when he left; and to his "Garfield" claim, which Fibby Winks had jumped? What had become of the mines of all his friends, of their cattle-ranches, of their deals? What, in fine, had become of Colorado and of the United States of America? They might have legislated silver out of existence at Washington, for all he knew, and turned the republic into a monarchy at the old stand.

His single resource from these pangs was his visits to the house of the missionary, where they talked Bangor, Maine, in the United States. To that house he knew that every day was bringing nearer the little girl he had come half-way round the world to keep in sight.

In the splendor of a yellow-and-violet morning, ten days after his arrival, he was roused from his sleep by a small, shrill voice in the veranda demanding the immediate attendance of the new Englishman. The Maharaj Kunwar, heir apparent to the throne of Gokral Seetarun, a wheat-colored child, aged nine, had ordered his miniature court, which was held quite distinct from his father's, to equip his C-spring barouche, and to take him to the rest-house.

Like his jaded father, the child required amusement. All the women of the palace had told him that the new Englishman made the King laugh. The Maharaj Kunwar could speak English much better than his father,—French, too, for the matter of that,—and he was anxious to show off his accomplishments to a court whose applause he had not yet commanded.

Tarvin obeyed the voice because it was a child's, and came out to find an apparently empty barouche and an escort of ten gigantic troopers.

"How do you do? *Comment vous portez-vous?* I am the prince of this state. I am the Maharaj Kunwar. Some day I shall be king. Come for a drive with me."

A tiny mittened hand was extended in greeting. The mittens were of the crudest magenta wool, with green stripes at the wrist; but the child was robed in stiff gold brocade from head to foot, and in his turban was set an aigret of diamonds six inches high, while emeralds in a thick cluster fell over his eyebrow. Under all this glitter the dark onyx eyes looked out, and they were full of pride and of the loneliness of childhood.

Tarvin obediently took his seat in the barouche. He was beginning to wonder whether he should ever wonder at anything again.

"We will drive beyond the race-course on the railway road," said the child. "Who are you?" he asked, softly laying his hand on Tarvin's wrist.

"Just a man, sonny."

The face looked very old under the turban, for those born to absolute power, or those who have never known a thwarted desire, and reared under the fiercest sun in the world, age even more swiftly than the other children of the East, who are self-possessed men when they should be bashful babes.

"They say you come here to see things."

"That's true," said Tarvin.

"When I'm king I shall allow nobody to come here—not even the viceroy."

"That leaves me out," remarked Tarvin, laughing.

"You shall come," returned the child, measuredly, "if you make me laugh. Make me laugh now."

"Shall I, little fellow? Well—there was once—I wonder what *would* make a child laugh in this country. I've never seen one do it yet. W-h-e-w!" Tarvin gave a low, long-drawn whistle. "What's that over there, my boy?"

A little puff of dust rose very far down the road. It was made by swiftly moving wheels, consequently it had nothing to do with the regular traffic of the state.

"That is what I came out to see," said the Maharaj Kunwar. "She will make me well. My father, the Maharajah, said so. I am not well now." He turned imperiously to a favorite groom at the back of the carriage. "Soor Singh,"—he spoke in the vernacular,— "what is it when I become without sense? I have forgotten the English." The groom leaned forward.

"Heaven-born, I do not remember," he said.

"Now I remember," said the child, suddenly. "Mrs. Estes says it is fits. What are fits?"

Tarvin put his hand tenderly on the child's shoulder, but his eyes were following the dust-cloud. "Let us hope she'll cure them, anyway, young un, whatever they are. But who is *she*?"

"I do not know the name, but she will make me well. See! My father has sent a carriage to meet her."

An empty barouche was drawn up by the side of the road as the rickety, straining mail-cart drew nearer, with frantic blasts upon a battered key-bugle.

"It's better than a bullock-cart, anyway," said Tarvin to himself, standing up in the carriage, for he was beginning to choke.

"Young man, don't you know who she is?" he asked huskily again.

"She was sent," said the Maharaj Kunwar.

"Her name 's Kate," said Tarvin in his throat, "and don't you forget it." Then to himself in a contented whisper, "Kate!"

The child waved his hand to his escort, who, dividing, lined each side of the road, with all the ragged bravery of irregular cavalry. The mail-carriage halted, and Kate, crumpled, dusty, disheveled from her long journey, and red-eyed from lack of sleep, drew back the shutters of the palanquin-like carriage, and stepped dazed into the road. Her numbed limbs would have doubled under her, but Tarvin, leaping from the barouche, caught her to him, regardless of the escort and of the calm-eyed child in the golden drapery, who was shouting, "Kate! Kate!"

"Run along home, bub," said Tarvin. "Well, Kate?"

But Kate had only her tears for him and a gasping "You! You! *You!*"

IX.

TEARS stood again in Kate's eyes as she uncoiled her hair before the mirror in the room Mrs. Estes had prepared against her coming—tears of vexation. It was an old story with her that the world wants nothing done for it, and visits with displeasure those who must prod up its lazy content. But in landing at Bombay she had supposed herself at the end of outside hindrances and obstacles; what was now to come would belong to the wholesome difficulties of real work. And here was Nick!

She had made the journey from Topaz in a long mood of exaltation. She was launched; it made her giddy and happy, like the boy's first taste of the life of men. She was free at last. No one could stop her. Nothing could keep her from the life to which she had promised herself. A little moment and she might stretch forth her hand and lay it fast upon her work. A few days and she should stoop eye to eye above the pain that had called to her across seas. In her dreams piteous hands of women were raised in prayer to her, and moist, sick palms were laid in hers. The steady urge of the ship was too slow for her; she counted the

throbs of the screw. Standing far in the prow, with wind-blown hair, straining her eyes toward India, her spirit went longingly forth toward those to whom she was going; and her life seemed to release itself from her, and sped far, far over the waves, until it reached them and gave itself to them. For a moment, as she set foot on land, she trembled with a revulsion of feeling. She drew near her work; but was it for her? This old fear, which had gone doubtfully with her purpose from the beginning, she put behind her with a stern refusal to question there. She was for so much of her work as Heaven would let her do; and she went forward with a new, strong, humble impulse of devotion filling and uplifting her.

It was in this mood that she stepped out of the coach at Rhatore into Tarvin's arms.

She did justice to the kindness that had brought him over all these leagues, but she heartily wished that he had not come. The existence of a man who loved her, and for whom she could do nothing, was a sad and troubling fact enough fourteen thousand miles away. Face to face with it, alone in India, it enlarged itself unbearably, and thrust itself between her and all her hopes of bringing serious help to others. Love literally did not seem to her the most important thing in the world at that moment, and something else did; but that did n't make Nick's trouble unimportant, or prevent it, while she braided her hair, from getting in the way of her thoughts. On the morrow she was to enter upon the life which she meant should be a help to those whom it could reach, and here she was thinking of Nicholas Tarvin.

It was because she foresaw that she would keep on thinking of him that she wished him away. He was the tourist wandering about behind the devotee in the cathedral at prayers; he was the other thought. In his person he represented and symbolized the life she had left behind; much worse, he represented a pain she could not heal. It was not with the haunting figure of love attendant that one carried out large purposes. Nor was it with a divided mind that men conquered cities. The intent with which she was aflame needed all of her. She could not divide herself even with Nick. And yet it was good of him to come, and like him. She knew that he had not come merely in pursuit of a selfish hope; it was as he had said—he could n't sleep nights, knowing what might befall her. That was *really* good of him.

Mrs. Estes had invited Tarvin to breakfast the day before, when Kate was not expected; but Tarvin was not the man to decline an invitation at the last moment on that account,

and he faced Kate across the breakfast-table next morning with a smile which evoked an unwilling smile from her. In spite of a sleepless night she was looking very fresh and pretty in the white muslin frock which had replaced her traveling-dress, and when he found himself alone with her after breakfast on the veranda (Mrs. Estes having gone to look after the morning affairs of a housekeeper, and Estes having betaken himself to his mission-school, inside the city walls), he began to make her his compliments upon the cool white, unknown to the West. But Kate stopped him.

"Nick," she said, facing him, "will you do something for me?"

Seeing her much in earnest, Tarvin attempted the parry humorous; but she broke in:

"No; it is something I want very much, Nick. Will you do it for me?"

"Is there anything I would n't do for you?" he asked seriously.

"I don't know; this, perhaps. But you must do it."

"What is it?"

"Go away."

He shook his head.

"But you must."

"Listen, Kate," said Tarvin, thrusting his hands deep into the big pockets of his white coat. "I can't. You don't know the place you've come to. Ask me the same question a week hence. I won't agree to go. But I'll agree to talk it over with you then."

"I know now everything that counts," she answered. "I want to do what I've come here for. I sha'n't be able to do it if you stay. You understand, don't you, Nick? Nothing can change that."

"Yes, it can. I can. I'll behave."

"You need n't tell me you'll be kind. I know it. But even you can't be kind enough to help hindering me. Believe that, now, Nick, and go. It is n't that I want you to go, you know."

"Oh!" observed Tarvin, with a smile.

"Well—you know what I mean," returned Kate, her face unrelaxed.

"Yes; I know. But if I'm good it won't matter. I know that too. You'll see," he said gently. "Awful journey, is n't it?"

"You promised me not to take it."

"I did n't take it," returned Tarvin, smiling, and spreading a seat for her in the hammock, while he took one of the deep veranda chairs himself. He crossed his legs and fixed the white pith helmet he had lately adopted on his knee. "I came round the other way on purpose."

"What do you mean?" asked Kate, dropping tentatively into the hammock.

"San Francisco and Yokohama, of course. You told me not to follow you."

"Nick!" She gathered into the single syllable the reproach and reproof, the liking and despair, with which the least and the greatest of his audacities alike affected her.

Tarvin had nothing to say for once, and in the pause that fell she had time to reassure herself of her abhorrence of his presence here, and time to still the impulse of pride, which told her that it was good to be followed over half the earth's girdle for love, and the impulse of admiration for that fine devotion—time, above all,—for this was worst and most shameful,—to scorn the sense of loneliness and far-awayness that came rolling in on her out of the desert like a cloud, and made the protecting and homelike presence of the man she had known in the other life seem for a moment sweet and desirable.

"Come, Kate, you did n't expect me to stay at home, and let you find your way out here to take the chances of this old sand-heap, did you? It would be a cold day when I let you come to Gokral Seetarun all by your lone, little girl—freezing cold, I've thought since I've been here, and seen what sort of camp it is."

"Why did n't you tell me you were coming?"

"You did n't seem particularly interested in what I did, when I last saw you."

"Nick! I did n't want you to come here, and I had to come myself."

"Well, you've come. I hope you'll like it," said he, grimly.

"Is it so bad?" she asked. "Not that I shall mind."

"Bad! Do you remember Mastodon?"

Mastodon was one of those Western towns which have their future behind them—a city without an inhabitant, abandoned and desolate.

"Take Mastodon for deadness, and fill it with ten Leadvilles for wickedness,—Leadville the first year,—and you've got a tenth of it."

He went on to offer her an exposition of the history, politics, and society of Gokral Seetarun, from his own point of view, dealing with the dead East from the standpoint of the living West, and dealing with it vividly. It was a burning theme, and it was a happiness to him to have a listener who could understand his attitude, even if she could not entirely sympathize with it. His tone besought her to laugh at it with him a little, if only a little, and Kate consented to laugh; but she said it all seemed to her more mournful than amusing.

Tarvin could agree to this readily enough, but he told her that he laughed to avoid weeping. It made him tired to see the fixedness, the apathy, and lifelessness of this rich and

populous world, which should be up and stirring by rights—trading, organizing, inventing, building new towns, making the old ones keep up with the procession, laying new railroads, going in for fresh enterprises, and keeping things humming.

"They've got resources enough," he said. "It is n't as if they had the excuse that the country's poor. It's a good country. Move the population of a lively Colorado town to Rhatore, set up a good local paper, organize a board of trade, and let the world know what there is here, and we'd have a boom in six months that would shake the empire. But what's the use? They're dead. They're mummies. They're wooden images. There is n't enough real, old-fashioned downright rustle and razzle-dazzle and 'git up and git' in Gokral Seetarun to run a milk-cart."

"Yes, yes"; she murmured, half to herself, with illumined eyes. "It's for that I've come."

"How's that?"

"Because they are *not* like us," she answered, turning her lustrous face on him. "If they were clever, if they were wise, what could we do for them? It is because they are lost, stumbling, foolish creatures that they need us." She heaved a deep sigh. "It is good to be here."

"It's good to have you," said Tarvin.

She started.

"Don't say such things any more, please, Nick," she said.

"Oh, well!" he groaned.

"But it's this way, Nick," she said earnestly, but kindly. "I don't belong to such things any more—not even to the possibility of them. Think of me as a nun. Think of me as having renounced all such happiness, and all other kinds of happiness but my work."

"H'm. May I smoke?" At her nod he lighted a cigar. "I'm glad I'm here for the ceremony."

"What ceremony?" she asked.

"Seeing you take the veil. But you won't take it."

"Why not?"

He grumbled inarticulately over his cigar a moment. Then he looked up. "Because I've got big wealth that says you won't. I know you, I know Rhatore, and I know—"

"What? Who?"

"Myself," he said, looking up.

She clasped her hands in her lap. "Nick," she said, leaning toward him, "you know I like you. I like you too well to let you go on thinking—You talk of not being able to sleep. How do you suppose I can sleep with the thought always by me that you are laying up a pain and disappointment for yourself—

one that I can't help, unless I can help it by begging you to go away now. I do beg it. *Please go!*"

Tarvin pulled at his cigar musingly for some seconds. "Dear girl, I'm not afraid."

She sighed, and turned her face away toward the desert. "I wish you were," she said hopelessly.

"Fear is not for legislators," he retorted oracularly.

She turned back to him with a sudden motion. "Legislators! O Nick, are you—"

"I'm afraid I am—by a majority of 1518." He handed her the cable-despatch.

"Poor father!"

"Well, I don't know."

"Oh! Well, I congratulate you, of course."

"Thanks."

"But I'm not sure it will be a good thing for you."

"Yes; that's the way it had struck me. If I spend my whole term out here, like as not my constituents won't be in a mood to advance my political career when I get back."

"All the more reason—"

"No; the more reason for fixing the real thing first. I can make myself solid in politics any time. But there is n't but one time to make myself solid with you, Kate. It's here. It's now." He rose and bent over her. "Do you think I can postpone that, dear? I can adjourn it from day to day, and I do cheerfully, and you sha'n't hear any more of it until you're ready to. But you like me, Kate. I know that. And I—well, I like you. There is n't but one end to that sort of thing." He took her hand. "Good-by. I'll come and take you for a look at the city to-morrow."

Kate gazed long after his retreating figure, and then took herself into the house, where a warm, healthful chat with Mrs. Estes, chiefly about the children at Bangor, helped her to a sane view of the situation she must face with the reappearance of Tarvin. She saw that he meant to stay, and if she did n't mean to go, it was for her to find the brave way of adjusting the fact to her hopes. His perversity complicated an undertaking which she had never expected to find simple in itself; and it was finally only because she trusted all that he said implicitly that she was able to stay herself upon his promise to "behave." Liberally interpreted, this really meant much from Tarvin; perhaps it meant all that she need ask.

When all was said, there remained the impulse to flight; but she was ashamed to find, when he came in the morning, that a formidable pang of homesickness drew her toward him, and made his definite and cheerful presence a welcome sight. Mrs. Estes had been kind. The two women had made friends, and

found each other's hearts with instant sympathy. But a home face was different, and perhaps Nick's was even more different. At all events, she willingly let him carry out his plan of showing her the city.

In their walk about it Tarvin did not spare her the advantage of his ten days' residence in Rhatore preceding her coming; he made himself her guide, and stood on rocks overlooking things, and spouted his second-hand history with an assurance that the oldest Political Resident might have envied. He was interested in the problems of the state, if not responsible for their solution. Was he not a member of a governing body? His ceaseless and fruitful curiosity about all new things had furnished him, in ten days, with much learning about Rhatore and Gokral Seetarun, enabling him to show to Kate, with eyes scarcely less fresh than her own, the wonders of the narrow, sand-choked streets, where the footfalls of camels and men alike fell dead. They lingered by the royal menagerie of starved tigers, and the cages of the two tame hunting-leopards, hooded like hawks, that slept, and yawned, and scratched on their two bedsteads by the main gate of the city; and he showed her the ponderous door of the great gate itself, studded with foot-long spikes against the attacks of that living battering-ram, the elephant. He led her through the long lines of dark shops planted in and among the ruins of palaces, whose builders had been long since forgotten, and about the straggling barracks, small knots of fantastically attired soldiers, who hung their day's marketing from the muzzle of the Brown Bess or flint-lock; and then he showed her the mausoleum of the kings of Gokral Seetarun, under the shadow of the great temple where the children of the sun and moon went to worship, and where the smooth, black stone bull glared across the main square at the cheap bronze statue of Colonel Nolan's predecessor—an offensively energetic and very plain Yorkshireman. Lastly, they found beyond the walls the clamoring caravansary of traders by the gateway of the Three Gods, whence the caravans of camels filed out with their burdens of glistening rock-salt for the railroad, and where by day and by night cloaked and jaw-bound riders of the desert, speaking a tongue that none could understand, rode in from God knows what fastness beyond the white hillocks of Jeysulmir.

As they went along, Tarvin asked her about Topaz. How had she left it? How was the dear old town looking? Kate said she had left it only three days after his departure.

"Three days! Three days is a long time in the life of a growing town."

Kate smiled. "I did n't see any changes," she said.

"No? Peters was talking about breaking ground for his new brick saloon on G street the day after I left; Parsons was getting in a new dynamo for the city's electric-light plant; they were just getting to work on the grading of Massachusetts Avenue, and they had planted the first tree in my twenty-acre plot. Kearney, the druggist, was putting in a plate-glass window, and I should n't wonder if Maxim had got his new post-office boxes from Meriden before you left. Did n't you notice?"

Kate shook her head. "I was thinking of something else just then."

"Pshaw! I'd like to know. But no matter. I suppose it *is* asking too much to expect a woman to play her own hand, and keep the run of improvements in the town," he mused. "Women are n't built that way. And yet I used to run a political canvass and a business or two, and something else in that town." He glanced humorously at Kate, who lifted a warning hand. "Forbidden subject? All right. I *will* be good. But they had to get up early in the morning to do anything to it without letting me into it. What did your father and mother say at the last?"

"Don't speak of that," begged Kate.

"Well, I won't."

"I wake up at night, and think of mother. It's dreadful. At the last I suppose I should have stayed behind and shirked if some one had said the right word—or the wrong one—as I got on board the train, and waved my handkerchief to them."

"Good heaven! Why did n't I stay!" he groaned.

"You could n't have said it, Nick," she told him quietly.

"You mean your father could. Of course he could, and if he had happened to be some one else he would. When I think of that I want to—!"

"Don't say anything against father, please," she said, with a tightening of the lips.

"O dear child!" he murmured contritely, "I did n't mean that. But I have to say something against somebody. Give me somebody to curse, and I'll be quiet."

"Nick!"

"Well, I'm not a block of wood," he growled.

"No; you are only a very foolish man."

Tarvin smiled. "Now you're shouting."

She asked him about the Maharaj Kunwar to change the subject, and Tarvin told her that he was a little brick. But he added that the society of Rhatore was n't all as good.

"You ought to see Sitabhai!"

He went on to tell her about the Maharajah and the people of the palace with whom she would come in contact. They talked of

the strange mingling of impassiveness and childishness in the people, which had already impressed Kate, and spoke of their primitive passions and simple ideas—simple as the massive strength of the Orient is simple.

"They are n't what we should call cultured. They don't know Ibsen a little bit, and they don't go in for Tolstoi for sour apples," said Tarvin, who did not read three newspapers a day at Topaz for nothing. "If they really knew the modern young woman, I suppose her life would n't be worth an hour's purchase. But they've got some rattling good old-fashioned ideas, all the same—the sort I used to hear once upon a time at my dear old mother's knee, away back in the State of Maine. Mother believed in marriage, you know; and that's where she agreed with me and with the fine old-style natives of India. The venerable, ramshackle, tumble-down institution of matrimony is still in use here, you know."

"But I never said I sympathized with Nora, Nick," exclaimed Kate, leaping all the chasms of connection.

"Well, then, that's where you are solid with the Indian Empire. The 'Doll's House' glanced right off this blessed old-timey country. You would n't know where it had been hit."

"But I don't agree with all your ideas either," she felt bound to add.

"I can think of one," retorted Tarvin, with a shrewd smile. "But I'll convert you to my views there."

Kate stopped short in the street along which they were walking. "I trusted you, Nick!" she said reproachfully.

He stopped, and gazed ruefully at her for a moment. "O Lord!" he groaned. "I trusted myself! But I'm always thinking of it. What can you expect? But I tell you what, Kate, this shall be the end—last, final, ultimate. I'm done. From this out I'm a reformed man. I don't promise not to think, and I'll have to go on feeling, just the same, but I'll be quiet.

Shake on it." He offered his hand, and Kate took it.

They walked on for some moments in silence until Tarvin said mournfully, "You did n't see Heckler just before you came away, did you?"

She shook her head.

"No; Jim and you never did get along much together. But I wish I knew what he's thinking about me. Did n't hear any rumor, any report, going around about what had become of me, I suppose?"

"They thought in town that you had gone to San Francisco to see some of the Western directors of the Colorado and California Central, I think. They thought that because the conductor of your train brought back word that you said you were going to Alaska, and they did n't believe that. I wish you had a better reputation for truth-telling at Topaz, Nick."

"So do I, Kate; so do I," exclaimed Tarvin heartily. "But if I had, how would I ever get the right thing believed? That's just what I wanted them to think—that I was looking after their interests. But where would I be if I had sent that story back? They would have had me working a land-grab in Chile before night. That reminds me—don't mention that I'm here in writing home, please. Perhaps they'll figure that out, too, by the rule of contraries, if I give them the chance. But I don't want to give them the chance."

"I'm not likely to mention it," said Kate, flushing.

A moment later she recurred to the subject of her mother. In the yearning for home that came upon her anew in the midst of all the strangeness through which Tarvin was taking her, the thought of her mother, patient, alone, looking for some word from her, hurt her as if for the first time. The memory was for the moment intolerable to her; but when Tarvin asked her why she had come at all if she felt that way, she answered with the courage of better moments: "Why do men go to war?"

(To be continued.)

ITALIAN OLD MASTERS.

ANDREA DEL SARTO. 1487-1531.

IT is a little amusing to see how, of all the painters of his time, Andrea del Sarto—*i. e.*, Andrea the son of the tailor—should have left for us the most traces of his genealogy, with the exception of Michelangelo and Titian, who were of noble families. His great-grandfather was an agricultural laborer, his grandfather a linen-

weaver, and his father a tailor. He was apprenticed when he was seven to a goldsmith, and at that tender age he would have found the mechanical occupation uninteresting even if he had not had a more decided bent for design, his precocity in which led to his being transferred to the studio of an indifferent painter, Giovanni Barile. Under Barile's instruction he remained till 1498, when he was

ST. AGNES, BY ANDREA DEL SARTO.

(IN THE PISA CATHEDRAL.)

recommended by his master as a competent assistant to Piero de' Medici, who employed him for a period of which we have no positive indication, giving him time for study of the classical work of the day, that of Masaccio, Leonardo, and Michelangelo. At that time it seems to have been the general practice of the young painters to study the works at the Carmine and those in the Papal hall of the Palazzo Vecchio, where the Cartoons were kept; and from the work of Leonardo and Michelangelo Andrea learned a breadth of treatment which is one of his most notable traits. With Francia Bigio, who was one of the fellow-students who met there, he contracted an intimacy which led to their taking quarters together and working more or less in company. Bigio was the pupil of Mariotto Albertinelli, who, with his co-worker Fra Bartolommeo, seems to have exercised an early influence on Andrea (who was at all periods of his life much influenced by those about him), and it is possibly to their example that the partnership between Bigio and Andrea was due.

All visitors to Florence know the frescos in the court of the convent of the Servi, which closes the Piazza of the Annunciata on the north. These are works of the period when Andrea was the companion of Bigio, and for them we have to thank the able enlistment of the rivalries of young ambitions, the friars having, on account of their want of means, the habit of employing the minor talents of the time. Fra Mariano, the sacristan, suggested to Andrea that it would be for his worldly advantage to have his work seen and known under the auspices of the convent, and at the same time insinuating a dose of personal rivalry with the compeers of the painter, succeeded in getting on very favorable terms a contract for the three frescos, "Saint Philip sharing his cloak with the leper," "Saint Philip cursing the gamblers," and "Saint Philip restoring the girl possessed of a devil." These were followed by two other Saint Philip subjects, and these established Andrea in the reputation of being one of the ablest painters of the day. They were all painted before he was twenty-three. To be near his work he took quarters with Bigio at the Sapienza, a block of buildings near the convent of the Servi, and here he was much in the society of Sansovino, with whom and other artistic and literary spirits he took part in the proceedings of a social and jovial club called "The Company of the Kettle." This society was organized on a large scale of conviviality, if we may judge from the rule that every member was allowed to invite four guests, while the members were expected to bring to the meetings every one his own dish, a fine being imposed on him who brought one which duplicated his neighbor's. The Bohemian element seems already to have taken the

place of the old religious feeling in the craft, for in this club and others which were formed in imitation of it there was more rioting than prayer.

While it is idle to assert that to succeed in the religious vein, that of Fra Angelico and Giotto, a painter must be a devout and pious man, it is not to be disputed that the religious temperament and a high standard of morality develop a loftier ideal, and that the pure and single-minded life which they produce brings out a greater intensity in any work and a more complete devotion to the higher aims of art, with less ostentation and vulgarity, and almost certainly a more impersonal and purer general tendency. Grave and direct purpose in painting, as in any other occupation, imparts a definite quality to the production; while the pleasure-loving and self-indulgent nature is betrayed in the works of Andrea, though nothing vicious or sensual can be charged to them. He became prosperous, and even before he could complete his contract with the Servi, he was overwhelmed with orders. His pictures had been hitherto mainly, if not altogether, in fresco, but in the course of the two or three years following 1510 he became distinguished for his success in oils. The romantic event of his life took place soon after his adoption of the new medium, which, being more adapted to the private commissions which he probably received in abundance, was more profitable than the convent commissions of the Servi. He was in love with the handsome Lucretia Recanati, the widow of a hatter in the Via San Gallo, whose character we know was such as to stimulate his worldliness, and after his marriage with the widow in 1513 he devoted himself, according to the traditions, to money-making. She was beautiful, and according to Vasari, who, being a pupil of Andrea, suffered from her real or asserted infirmities, was so tyrannical and meddling that she drove his apprentices out of the house by her temper. Vasari gives her a bad character, but nothing remains to show the foundation of the charge.

Andrea was one of the artists who produced the model of the façade of the Duomo of Florence at the time of the visit of Leo X. This model was afterward allowed to go to ruin, to the regret of the time, which regarded its classical style as worthy of perpetuation in stone. As it was produced by Andrea and Sansovino jointly, we do not know with what part in it the former is to be credited. The masterly knowledge of perspective shown in some of his frescos would suggest, however, such a knowledge of architecture as most of the painters of the period possessed. Andrea's skill in contriving spectacular displays was put to use in the funeral ceremonies of Giuliano de' Medici

TWO ANGELS, BY ANDREA DEL SARTO.

(IN THE FLORENCE ACADEMY.)

in 1516, and in the following year we find him at work again at the "Scalzo," the convent which had drawn Andrea away from the Servi by higher pay. At about the same time he was painting the Virgin and Child, St. Francis and St. John the Evangelist with angels, now in the Uffizi. About this time the attention of Francis I. of France was drawn to the works of Andrea by a picture of a dead Christ mourned by three angels which was sent to France, the result of which was a call to the court of Francis, which he accepted, going thither in 1518. His success was great, and he was in the full enjoyment of the royal favor until his wife, tired of her solitude in Florence, a condition which does not chime with Vasari's accusations of weak morality, prevailed on him by her entreaties to return to Florence. Having obtained the permission of the king, and being commissioned to make purchases of pictures for the royal account, the money for which was intrusted to him, he returned to his home and spent his own and the king's money in building himself a house, so that he was unable to return to France, and in 1520 he was at work again for the Scalzo, where he painted until 1523. When the plague appeared in Florence in 1524, he went to Mugello, where he painted several pictures for the nunnery there. He returned to Florence in the autumn, and remained there, so far as we know, throughout the rest of his life, occupied mostly in painting altarpieces. He died on the 22d of January, 1531.

The art of Andrea approaches more the modern motive than that of any of his contemporaries, and the quality of pictorial effect, which he had learned from Da Vinci, was carried by

him, if in a somewhat meretricious way, further than it was by any of his immediate successors. His color, while never of the grand Venetian type, was harmonious and more varied than that of any of his rivals. It was of a nature to attract the popular approbation and that of partially educated lovers of art. In his design he caught something from all the masters, now from Michelangelo, now from Da Vinci, and now from Ghirlandaio; his versatility and facility were extraordinary, and though his art belongs distinctly to the decline, it is, like all first fruits of the over-cultivation of the sensuous qualities, more attractive than severer classical work. Spiritual elevation is no longer present in art at that time; intellectual dignity appears in some later painters to such a degree that it almost simulates the loftiness of the purist painters; but neither the one quality nor the other belonged to Andrea, whose gifts were almost entirely technical. He brought fresco to its highest perfection in the qualities of execution and sweetness of color, and his work in oils is surprising in its ease and certainty of touch. The traditions of art were so confirmed in that day that he had no need to develop great originality of design, for the greater masters of that quality had left him ample material. Originality was not then looked on as now, the adoption of a design due to an earlier master being the constant practice of even the greatest painters. What had been done was the common property of the art, and Raphael's "Sposalizio" was not the worse thought of for its having been taken almost bodily from that of his master, Perugino. If the art of Andrea can properly be called religious art, it is the latest in the Florentine school that we can accept under this designation.

W. J. Stillman.

NOTE BY TIMOTHY COLE ON THE "ST. AGNES" OF ANDREA DEL SARTO.

THE "St. Agnes" by Andrea del Sarto in the Duomo at Pisa is one of the sweetest and most refined subjects by him that I know of. It is in excellent preservation, and hangs on the last pillar on the right of the nave as you face the high altar. It is painted on wood, and measures 4 feet 11 inches high by 3 feet 5 inches wide. It is very pleasant and harmonious in coloring. The robe about the shoulders is of a reddish-salmon color, of a florid yet soft and charming hue. This is offset by the lovely landscape background, which is, in general tone, of a cool gray-blue, soft and flowing in treatment. The lower robe about the knees is of a warm purplish-gray—a delightful cool, creamy tone in the high lights, becoming of a plum color in the middle tints and of a stronger and more decided purple in the darker shades. The robe over the seat is

of a dark, rich lustrous blue. The sleeve of the arm that holds the palm is of a soft neutral green. The head-dress is white, lower in tone than the high lights of the flesh. The flesh-tints are mellow and soft. The expression of the face is subtle and refined. It is so highly wrought, and delicate and sweet, that very little would coarsen and vulgarize it. I have not been able to do more than suggest its charming quality.

St. Agnes was a Roman maiden, and suffered martyrdom at an early age, by the sword, because of her profession of Christianity, A. D. 304. Her followers were used to assemble at her tomb for devotion, and there one day she appeared to them with a lamb by her side, and told them of her perfect happiness and glory. She holds, therefore, the palm of the martyr, and her emblem is the lamb.

INDIAN SCOUTS WATCHING CUSTER'S ADVANCE.

CUSTER'S LAST BATTLE.

BY ONE OF HIS TROOP COMMANDERS.

ON the 16th of April, 1876, at McComb City, Missouri, I received orders to report my troop ("K," 7th Cavalry) to the Commanding General of the Department of Dakota, at St. Paul, Minnesota. At

the latter place about twenty-five recruits fresh from civil life joined the troop, and we were ordered to proceed to Fort Abraham Lincoln, Dakota, where the Yellowstone Expedition was being organized. This expedition consisted of the 7th United States Cavalry, commanded by General George A. Custer, 28 officers and about 700 men; two companies of the 17th United States Infantry, and one company of the 6th United States Infantry, 8 officers and 135 men; one platoon of Gatling guns, 2 officers and 32 men (of the 20th United States Infantry); and 40 "Ree" Indian scouts. The expeditionary forces were commanded by Brigadier-General Alfred H. Terry, the Department Commander, who with his staff arrived several days prior to our departure.

On the 17th day of May, at 5 A.M., the "general"¹ was sounded, the wagons were packed and sent to the Quartermaster, and by

¹ The signal to take down tents and break camp.

six o'clock the wagon-train was on the road escorted by the infantry. By seven o'clock the 7th Cavalry was marching in column of platoon around the parade-ground of Fort Lincoln, headed by the band playing "Garry Owen," the Seventh's battle tune, first used when the regiment charged at the battle of Washita. The column was halted and dismounted just outside the garrison. The officers and married men were permitted to leave the ranks to say "good-by" to their families. General Terry, knowing the anxiety of the ladies, had assented to, or ordered, this demonstration, in order to allay their fears and satisfy them, by the formidable appearance we made, that we were able to cope with any enemy that we might expect to meet. Not many came out to witness the pageant, but many tear-filled eyes looked from the windows.

During this halt the wagon-train was assembled on the plateau west of the post and formed in column of fours. When it started off the "assembly" was sounded and absentees joined their commands. The signals "Mount" and "Forward" were sounded, and the regiment marched away, the band playing "The girl I left behind me."

The 7th Cavalry was divided into two columns, designated right and left wings, com-

manded by Major Marcus A. Reno and Captain F. W. Benteen. Each wing was subdivided into two battalions of three troops each. After the first day the following was the habitual order of march: one battalion was advance-guard, one was rear-guard, and one marched on each flank of the train. General Custer, with one troop of the advance-guard, went ahead and selected the route for the train and the camping-places at the end of the day's march. The other two troops of the advance-guard reported at headquarters for pioneer or fatigue duty, to build bridges and creek crossings. The rear-guard kept behind everything; when it came up to a wagon stalled in the mire, it helped to put the wagon forward. The battalions on the flanks were to keep within five hundred yards of the trail and not to get more than half a mile in advance or rear of the train. To avoid dismounting any oftener than necessary, the march was conducted as follows: one troop marched until about half a mile in advance of the train, when it was dismounted, the horses unbitted and allowed to graze until the train had passed and was about half a mile in advance of it, when it took up the march again; each of the other two troops would conduct their march in the same manner, so that two troops would be alongside the train all the time. If the country was much broken, a half dozen flankers were thrown out to guard against surprise. The flankers regulated their march so as to keep abreast of their troop. The pack-animals and beef herd were driven alongside the train by the packers and herders.

One wagon was assigned to each troop, and transported five days' rations and forage and the mess kit of the troop; also the mess kit, tents, and baggage of the troop officers and ten days' supplies for the officers' mess. The men were armed with the carbine and revolver; no one, not even the officer of the day, carried the saber. Each troop horse carried, in addition to the rider, between eighty and ninety pounds. This additional weight included all equipments and about one hundred rounds of ammunition. The wagon-train consisted in all of about one hundred and fifty wheeled vehicles. In it were carried thirty days' supplies of forage and rations (excepting beef), and two hundred rounds of ammunition per man. The two-horse wagons, hired by contract, carried from fifteen hundred to two thousand pounds. The six-mule government wagons carried from three to five thousand pounds, depending on the size and condition of the mules. The Gatling guns were each hauled by four condemned cavalry horses and marched in advance of the train. Two light wagons, loaded with axes, shovels, pick-axes and some pine boards and scantling, sufficient for a short bridge, accompanied the

"pioneer" troops. The "crossings," as they are termed, were often very tedious and would frequently delay the train several hours. During this time the cavalry horses were unbitted and grazed, the men holding the reins. Those men not on duty at the crossing slept, or collected in groups to spin yarns and take a whiff at their "dingy dudeens." The officers usually collected near the crossing to watch progress, and passed the time in conversation and playing practical jokes. About noon the "strikers," who carried the haversacks, were called, and the different messes had their luncheon, sometimes separately, sometimes clubbing together. When the haversacks were opened, the horses usually stopped grazing and put their noses near their riders' faces and asked very plainly to share the hardtack; if their polite request did not receive attention they would paw the ground, or even strike their riders. The old soldier was generally willing to share with his beast.

The length of the day's march, varying from ten to forty miles, was determined in a great measure by the difficulties or obstacles encountered, by wood, water, and grass, and by the distance in advance where such advantages were likely to be found. If, about two or three o'clock in the afternoon, a column of smoke was seen in the direction of the trail and a mile or two in advance, it was a pretty sure indication that a camp had been selected. The cavalry, excepting the rear-guard, would then cut loose from the train and go directly to camp. The rear-guard would send details to collect fuel and unpack their wagons. The adjutant showed the wing commanders the general direction their lines of tents were to run, and the latter then directed the battalion or troop commanders to their camping-places. Generally one flank of each line would rest near the creek. The general form of the camp was that of a parallelogram. The wings camped on the long sides facing each other, and the headquarters and guard were located at one end nearest to the creek; the wagon-train was parked to close the other end and was guarded by the infantry battalion. The troops, as they arrived at their places, were formed in line, facing inward, dismounted, unsaddled, and, if the weather was hot and the sun shining, the men rubbed the horses' backs until dry. After this the horses were sent to water and put out to graze, with side-lines and lariats, under charge of the stable guard, consisting of one non-commissioned officer and three or six privates. The men of the troop then collected fuel, sometimes wood, often a mile or more distant from the camp; sometimes "buffalo chips." The main guard, consisting, usually, of four or five non-commissioned officers and twelve or fifteen privates, reported mounted at headquarters, and were

MAJOR-GENERAL GEORGE A. CUSTER.
(FROM A PHOTOGRAPH BY BRADY.)

was performed by an officer designated as "Officer of the Herd." To preserve the grazing in the immediate vicinity of the camp for evening and night grazing, all horses were required to be outside of the camp limits until retreat. When the train arrived, the headquarters and troop wagons went directly to the camping-place of their respective commands. The officers' baggage and tents were unloaded first; then the wagons went near the place where the troop kitchen was to be located, always on that flank of the troop farthest from headquarters. The teamsters unharnessed their mules and put them out to graze. The old stable guard reported to the troop commander for fatigue duty to put up the officers' tents and collect fuel for their mess. The troop officers' tents were usually placed twenty-five yards in rear of the line of men's tents and facing toward them. Their cook or mess tent was placed about ten or fifteen yards further to the rear. The "striker" made down the beds and arranged the "furniture," so to speak, which generally consisted of a camp-stool, tin wash-basin, and a looking-glass. The men put up their tents soon after caring for their horses. The fronts of their tents were placed on a line established by stretching a picket-rope. The first sergeant's was on that flank of the line nearest to the headquarters. The horse equipments were placed on a line three yards in front of the tents. The men were not prohibited from using their

directed to take posts on prominent points overlooking the camp and surrounding country, to guard against surprise. Each post consisted of one non-commissioned officer and three privates. The officer of the day, in addition to his ordinary duties in camp, had charge of the safety of the cavalry herds. Sometimes this latter duty

saddles as pillows. A trench was dug for the mess fire, and the grass was burned around it for several yards to prevent prairie fires. After this the cooks busied themselves preparing supper. Beef was issued soon after the wagon-train came in, and the necessary number of beeves were butchered for the

next day's issue; this was hauled in the wagons. Stable call was sounded about an hour before sunset. The men of each troop were formed on the parade and marched to the horse herds by the first sergeant. Each man went to his own horse, took off the side-lines and fastened them around the horse's neck, then pulled the picket-pin, coiled the lariat, noosed the end fastened to the head halter around the horse's muzzle, mounted, and assembled in line at a place indicated by the first sergeant. The troop was then marched to the watering-place, which was usually selected with great care because of the boggy banks and miry beds of the prairie streams. After watering, the horses were lariatied outside but in the immediate vicinity of the camp. The ground directly in rear of the troop belonged to it, and was jealously guarded by those concerned against encroachment by others. After lariatied their horses, the men got their curry-combs, brushes, and nose-bags, and went to the troop wagon, where the quartermaster-sergeant and farrier measured, with tin cups, the forage to each man, each watching jealously that he got as much for his horse as those before him. He then went at once to feed and groom his horse. The officer whose duty it was to attend stables and the first sergeant superintended the grooming, examining each horse's back and feet carefully to see if they were all right. When a horse's back got sore through the carelessness of the rider, the man would generally be compelled to lead his horse until the sore was well. Immediately after stables, the cooks announced in a loud tone "supper." The men with haversack and tin cup went to the mess fire and got their hardtack, meat, and coffee. If game had been killed the men did a little extra cooking themselves.

The troop officers' mess kits consisted of a sheet-iron cooking-stove, an iron kettle, stewing, frying, baking, and dish pans; a small Dutch oven, a camp-kettle, a mess-chest holding tableware for four persons, and a small folding-table. The table in fair weather was spread in the open air. The early part of the meal was a matter of business, but after the substantial were stowed away, the delicacies were eaten more leisurely and time found for conversation. After supper the pipes were lighted, and the officers, if the weather was cold, went to the windward side of the camp-fire. Each man as he took his place was sure to poke or kick the fire, turn his back, hitch up his coat-tail, and fold his hands behind him.

Retreat was sounded a little after sunset and the roll was called, as much to insure the men having their equipments in place as to secure their presence, for it was not often we were near enough to any attraction to call the men

away. (In 1876 there was not a ranch west of Bismarck, Dakota, nor east of Bozeman, Montana.) The stable guards began their tours of duty at this time. The non-commissioned officer reported to the troop commander for instructions for the night; these usually designated whether the horses were to be tied to the picket-line or kept out to graze, and included special instructions for the care of sick or weak horses. At dusk all horses were brought within the limits of the camp. The picket-line was stretched over three wagons in front of the men's tents, or three posts were used when remaining in camp over a day.

During the evening the men grouped about the fires and sang songs and spun yarns until "taps." The cooks prepared the breakfast, which usually consisted of hard bread, bacon, and coffee. If beans or fresh meat were to be cooked, the food was put into the Dutch ovens or camp-kettles, which were placed in the fire trench, covered over with hot ashes and coals, and a fire built over them. If the wind blew hard all fires were extinguished, to prevent prairie fires. The cooks were called an hour or an hour and a half before reveille. At the first call for reveille, usually 4.20 A. M., the stable guard awakened the occupants of each tent and the officer whose duty it was to attend the roll-call. Stable call followed reveille and was superintended by an officer. This occupied about three-quarters of an hour. Two hours after reveille, the command would be on the march. Of course there were incidents that occasionally relieved the monotony.

Antelope were very plentiful, and the men were encouraged by troop commanders to hunt. General Custer had a number of stag-hounds, which amused themselves and the command in their futile attempts to catch them. One morning they started up a large buck near where the column was marching; Lieutenant Hare immediately followed the hounds, passed them, drew his revolver, and shot the buck. Nothing of special interest occurred until the 27th of May, when we came to the Bad Lands of the Little Missouri River. On the 30th General Custer was sent with four troops to make a scout up the Little Missouri, for about twenty miles. He returned the same day, without having discovered any recent "Indian signs." On the 31st we crossed the Little Missouri without difficulty. On the 1st and 2d of June we were obliged to remain in camp on account of a snow-storm.

We remained in camp on the Powder River for three days. General Terry went to the Yellowstone to communicate with the supply steamer *Far West*, which was at the mouth of the Powder River. He also went up the Yellowstone to communicate with General Gib-

bon's command, known as the "Montana Column," composed of four troops of the 2d Cavalry and several companies of the 7th Infantry. Before General Terry left it was given out that the 7th Cavalry would be sent to scout up the Powder River, while the wagon-train, escorted by the infantry, would be sent to establish a supply camp at the mouth of the Powder.

Eleven pack-mules, saddles, and aparejos were issued to each troop for this scout. This was a new departure; neither officers, men, nor mules had had any experience with this method of transportation. There were a few "packers" (civilian employés) to give instructions. Short, compactly built mules, the best for the purpose, were selected from the teams. A non-commissioned officer and four men of each troop were detailed for packers. After some instruction had been given by the professionals, especially how to tie the "diamond hitch," we concluded to make our maiden attempt by packing two empty water-casks. The mule was blinded and he submitted, with some uneasiness, to the packing. We supposed the packs were securely fastened and did not anticipate any trouble; but it is always the unexpected that happens with a mule. The blind was lifted; the mule gave a startled look first to one side, then to the other, at the two casks bandaged to his sides. He jumped to one side, causing to rattle a bung-plug that had fallen inside one of the casks. This startled him still more, and with head and tail high in the air he jumped again. He snorted and brayed, bucked and kicked, until the casks fell off. One was fastened to the saddle by the sling-rope. He now began to run, braying and making such a "rumpus" that the camp turned out as spectators. The affair excited serious concern lest all the animals in camp would be stampeded. When the cask was loose we got him back and made a second attempt with two sacks of grain. These he soon bucked off and then regaled himself with the spilt grain. As a final effort we concluded to try the aparejo, and pack two boxes of ammunition. This done, the mule walked off with as little concern as if he had been a pack-mule all his life.

General Terry having returned, orders were issued on the 10th for the right wing, six troops, under Major Reno, to make a scout up the Powder, provided with twelve days' rations.

The left wing was ordered to turn over all forage and rations; also the pack-mules, except four to each troop. Major Reno left at 3 P. M., and the next day the rest of the command marched to the mouth of the Powder. My troop was rear-guard, and at times we were over three miles in rear of the wagon-train waiting on the packers, for we had taken this opportunity to give them practical instruction.

Up to this time we had not seen an Indian, nor any recent signs of them, except one small trail of perhaps a half dozen tepees, evidently of a party of agency Indians on their way to join the hostile camps. The buffalo had all gone west; other game was scarce and wild. The indications were that the Indians were west of the Powder, and information from General Gibbon placed them south of the Yellowstone. Some of the officers of the right wing before they left expressed their belief that we would not find any Indians, and were sanguine that we would all get home by the middle of August.

Major Reno was ordered to scout to the forks of the Powder, then across to Mizpah Creek, follow it down to near its confluence with the Powder; then cross over to Pumpkin Creek, follow it down to the Tongue River, scout up that stream, and then rejoin the regiment at the mouth of the Tongue by the time his supplies were exhausted; unless, in the mean time, he should make some discovery that made it necessary to return sooner to make preparations for pursuit. A supply depot was established at the mouth of the Powder, guarded by the infantry, at which the wagon-train was left.

General Terry, with his staff and some supplies, took passage on the supply steamer *Far West*, and went up to the mouth of the Tongue. General Custer, with the left wing, marched to the mouth of the Tongue, where we remained until the 19th waiting tidings from Reno's scout. The grounds where we camped had been occupied by the Indians the previous winter. (Miles City, Montana, was first built on the site of this camp.) The rude shelters for their ponies, built of driftwood, were still standing and furnished fuel for our camp-fires. A number of their dead, placed upon scaffolds, or tied to the branches of trees, were disturbed and robbed of their trinkets. Several persons rode about exhibiting trinkets with as much gusto as if they were trophies of their valor, and showed no more concern for their desecration than if they had won them at a raffle. Ten days later I saw the bodies of these same persons dead, naked, and mutilated.

On the 19th of June tidings came from Reno that he had found a large trail that led up the Rosebud River. The particulars were not generally known. The camp was full of rumors; credulity was raised to the highest pitch, and we were filled with anxiety and curiosity until we reached Reno's command, and learned the details of their discoveries. They had found a large trail on the Tongue River, and had followed it up the Rosebud about forty miles. The number of lodges in the deserted villages was estimated by the number of camp-fires remaining to be about three hun-

dred and fifty. The indications were that the trail was about three weeks old. No Indians had been seen, nor any recent signs. It is not probable that Reno's movements were known to the Indians, for on the very day Reno reached his farthest point up the Rosebud, the battle of the Rosebud, between General Crook's forces and the Indians, was fought. The two commands were then not more than forty miles apart, but neither knew nor even suspected the proximity of the other.

We reached the mouth of the Rosebud about noon on the 21st, and began preparations for the march and the battle of the Little Big Horn.

There were a number of Sioux Indians who never went to an agency except to visit friends and relatives. They camped in and roamed about the Buffalo Country. Their camp was the rendezvous for the agency Indians when they went out for their annual hunts for meat and robes. They were known as the "Hostiles," and comprised representatives from all the different tribes of the Sioux nation. Many of them were renegade outlaws from the agencies. In their visits to the agencies they were usually arrogant and fomenters of discord. Depredations had been made upon the commerce to the Black Hills, and a number of lives taken by them or by others, for which they were blamed. The authorities at Washington had determined to compel these Indians to reside at the agencies—hence the Sioux War. Sitting Bull, an Uncpapa Sioux Indian, was the chief of the hostile camp; he had about sixty lodges of followers on whom he could at all times depend. He was the host of the Hostiles, and as such received and entertained their visitors. These visitors gave him many presents, and he was thus enabled to make many presents in return. All visitors paid tribute to him, so he gave liberally to the most influential, the chiefs, *i. e.*, he "put it where it would do the most good." In this way he became known as the chief of the hostile Indian camp, and the camp was generally known as "Sitting Bull's camp." Sitting Bull was a heavy-set, muscular man, about five feet eight inches in stature, and at the time of the battle of the Little Big Horn was forty-two years of age. He was the autocrat of the camp—chiefly because he was the host. In council his views had great weight, because he was known as a great medicine man. He was a chief, but not a warrior chief. In the war councils he had a voice and vote the same as any other chief. A short time previous to the battle he had "made medicine," had predicted that the soldiers would attack them and that the soldiers would all be killed. He took no active part in the battle, but, as was his custom in time of danger, remained in the

village "making medicine." Personally he was regarded as a great coward and a very great liar, "a man with a big head and a little heart." The command passed the remains of a "Sundance" lodge which took place about June 5, and to which I shall again refer. This was always a ceremony of great importance to the Indians. It ranks in interest and importance to the Indians with the graduation or commencement exercises of our civilized communities. In anticipation of this event, the Indians from the agencies had assembled at this camp.

Major James McLaughlin, United States Indian Agent, stationed at the Devil's Lake Agency, Dakota, from 1870 to 1881, and at Standing Rock Agency, Dakota, from 1881 to the present time, has made it a point to get estimates of the number of Indians at the hostile camp at the time of the battle. In his opinion, and all who know him will accept it with confidence, about one-third of the whole Sioux nation, including the northern Cheyennes and Arapahoes, were present at the battle; he estimates the number present as between twelve and fifteen thousand; that one out of four is a low estimate in determining the number of warriors present; every male over fourteen years of age may be considered a warrior in a general fight such as was the battle of the Little Big Horn; also, considering the extra hazards of the hunt and expected battle, fewer squaws would accompany the recruits from the agencies. The minimum strength of their fighting men may then be put down as between twenty-five hundred and three thousand. Information was despatched from General Sheridan that from one agency alone about eighteen hundred lodges had set out to join the hostile camp; but that information did not reach General Terry until several days after the battle. The principal warrior chiefs of the hostile Indians were: "Gall," "Crow King," and "Black Moon," Uncpapa Sioux; "Low Dog," "Crazy Horse," and "Big Road," Ogallala Sioux; "Spotted Eagle," Sans-Arc Sioux; "Hump" of the Minneconjous; and "White Bull" and "Little Horse," of the Cheyennes. To these belong the chief honors of conducting the battle, of whom, however, "Gall," "Crow King," and "Crazy Horse" were the ruling spirits.

Generals Terry, Gibbon, and Custer had a conference on board the steamer *Far West*. It was decided that the 7th Cavalry, under General Custer, should follow the trail discovered by Reno. "Officers' call" was sounded as soon as the conference had concluded. Upon assembling, General Custer gave us our orders. We were to transport on our pack-mules fifteen days' rations of hard bread, coffee, and sugar; twelve days' rations of bacon, and fifty rounds of carbine ammunition per man. Each man

was to be supplied with 100 rounds of carbine and 24 rounds of pistol ammunition, to be carried on his person and in his saddle-bags. Each man was to carry on his horse twelve pounds of oats. The pack-mules sent out with Reno's command were badly used up, and promised seriously to embarrass the expedition. General Custer recommended that some extra forage be carried on the pack-mules. In endeavoring to carry out this recommendation some troop commanders foresaw the difficulties, and told the General that some of the mules would certainly break down, especially if the extra forage was packed. He replied in an excited manner, quite unusual with him: "Well, gentlemen, you may carry what supplies you please; you will be held responsible for your companies. The extra forage was only a suggestion, but this fact bear in mind, we will follow the trail for fifteen days unless we catch them before that time expires, no matter how far it may take us from our base of supplies; we may not see the supply steamer again;" and, turning as he was about to enter his tent, he added, "You had better carry along an extra supply of salt; we may have to live on horse meat before we get through." He was taken at his word, and an extra supply of salt was carried. "Battalion" and "wing" organizations were broken up, and troop commanders were responsible only to General Custer. His written instructions were as follows:

CAMP AT MOUTH OF ROSEBUD RIVER, MONTANA TERRITORY, June 22d, 1876. LIEUTENANT-COLONEL CUSTER, 7TH CAVALRY. COLONEL: The Brigadier-General Commanding directs that, as soon as your regiment can be made ready for the march, you will proceed up the Rosebud in pursuit of the Indians whose trail was discovered by Major Reno a few days since. It is, of course, impossible to give you any definite instructions in regard to this movement, and were it not impossible to do so the Department Commander places too much confidence in your zeal, energy, and ability to wish to impose upon you precise orders which might hamper your action when nearly in contact with the enemy. He will, however, indicate to you his own views of what your action should be, and he desires that you should conform to them unless you shall see sufficient reason for departing from them. He thinks that you should proceed up the Rosebud until you ascertain definitely the direction in which the trail above spoken of leads. Should it be found (as it appears almost certain that it will be found) to turn towards the Little Horn, he thinks that you should still proceed southward, perhaps as far as the headwaters of the Tongue, and then turn towards the Little Horn, feeling constantly, however, to your left, so as to preclude the possibility of the escape of the Indians to the south or southeast by passing around your left flank. The column of Colonel Gibbon is now in motion for the mouth of the Big Horn. As soon as it reaches

that point it will cross the Yellowstone and move up at least as far as the forks of the Big and Little Horns. Of course its future movements must be controlled by circumstances as they arise, but it is hoped that the Indians, if upon the Little Horn, may be so nearly inclosed by the two columns that their escape will be impossible.

The Department Commander desires that on your way up the Rosebud you should thoroughly examine the upper part of Tulloch's Creek, and that you should endeavor to send a scout through to Colonel Gibbon's column, with information of the result of your examination. The lower part of this creek will be examined by a detachment from Colonel Gibbon's command. The supply steamer will be pushed up the Big Horn as far as the forks if the river is found to be navigable for that distance, and the Department Commander, who will accompany the column of Colonel Gibbon, desires you to report to him there not later than the expiration of the time for which your troops are rationed, unless in the mean time you receive further orders. Very respectfully, your obedient servant, E. W. SMITH, Captain 18th Infantry, Acting Assistant Adjutant-General.

These instructions are explicit, and fixed the location of the Indians very accurately. Of course as soon as it was determined that we were to go out, nearly every one took time to write letters home, but I doubt very much if there were many of a cheerful nature. Some officers made their wills; others gave verbal instructions as to the disposition of personal property and distribution of mementos; they seemed to have a presentiment of their fate.

At twelve o'clock, noon, on the 22d of June, the "Forward" was sounded, and the regiment marched out of camp in column of fours, each troop followed by its pack-mules. Generals Terry, Gibbon, and Custer stationed themselves near our line of march and reviewed the regiment. General Terry had a pleasant word for each officer as he returned the salute. Our pack-trains proved troublesome at the start, as the cargoes began falling off before we got out of camp, and during all that day the mules straggled badly. After that day, however, they were placed under the charge of an officer, who was directed to report at the end of each day's march the order of merit of the efficiency of the troop packers. Doubtless General Custer had some ulterior design in this. It is quite probable that if he had had occasion to detach troops requiring rapid marching, he would have selected those troops whose packers had the best records. At all events the efficiency was much increased, and after we struck the Indian trail the pack-trains kept well closed.

We went into camp about 4 P. M., having marched twelve miles. About sunset "officers' call" was sounded, and we assembled at General Custer's bivouac and squatted in groups about the General's bed. It was not a cheer-

ful assemblage; everybody seemed to be in a serious mood, and the little conversation carried on, before all had arrived, was in undertones. When all had assembled the General said that until further orders trumpet-calls would not be sounded except in an emergency; the marches would begin at 5 A. M. sharp; the troop commanders were all experienced officers, and knew well enough what to do, and when to do what was necessary for their troops; there were two things that would be regulated from his headquarters, *i. e.*, when to move out of and when to go into camp. All other details, such as reveille, stables, watering, halting, grazing, etc., on the march would be left to the judgment and discretion of the troop-commanders; they were to keep within supporting distance of each other, not to get ahead of the scouts, or very far to the rear of the column. He took particular pains to impress upon the officers his reliance upon their judgment, discretion, and loyalty. He thought, judging from the number of lodge-fires reported by Reno, that we might meet at least a thousand warriors; there might be enough young men from the agencies, visiting their hostile friends, to make a total of fifteen hundred. He had consulted the reports of the Commissioner of Indian Affairs as to the probable number of "Hostiles" (those who had persistently refused to live or enroll themselves at the Indian agencies), and he was confident, if any reliance was to be placed upon those reports, that there would not be an opposing force of more than fifteen hundred. General Terry had offered him the additional force of the battalion of the 2d Cavalry, but he had declined it because he felt sure that the 7th Cavalry could whip any force that would be able to combine against him; that if the regiment could not, no other regiment in the service could; if they could whip the regiment, they would be able to defeat a much larger force, or, in other words, the reinforcement of this battalion could not save us from defeat. With the regiment acting alone there would be harmony, but another organization would be sure to cause jealousy. He had declined the offer of the Gatling guns for the reason that they might hamper our movements or march at a critical moment, because of the difficult nature of the country through which we would march. The marches would be from twenty-five to thirty miles a day. Troop officers were cautioned to husband their rations and the strength of their mules and horses, as we might be out for a great deal longer time than that for which we were rationed, as he intended to follow the trail until we could get the Indians, even if it took us to the Indian agencies on the Missouri River or in Nebraska. All

officers were requested to make to him, then or at any time, any suggestions they thought fit.

This "talk" of his, as we called it, was considered at the time as something extraordinary for General Custer, for it was not his habit to unbosom himself to his officers. In it he showed a lack of self-confidence, a reliance on somebody else; there was an indefinable something that was not Custer. His manner and tone, usually brusque and aggressive, or somewhat rasping, was on this occasion conciliating and subdued. There was something akin to an appeal, as if depressed, that made a deep impression on all present. We compared watches to get the official time, and separated to attend to our various duties. Lieutenants McIntosh, Wallace,¹ and myself walked to our bivouac, for some distance in silence, when Wallace remarked: "Godfrey, I believe General Custer is going to be killed." "Why, Wallace," I replied, "what makes you think so?" "Because," said he, "I have never heard Custer talk in that way before."

I went to my troop and gave orders what time the "silent" reveille should be and as to other details for the morning preparations; also the following directions in case of a night attack: the stable guard, packers, and cooks were to go out at once to the horses and mules to quiet and guard them; the other men were to go at once to a designated rendezvous and await orders; no man should fire a shot until he received orders from an officer to do so. When they retired for the night they should put their arms and equipments where they could get them without leaving their beds. I then went through the herd to satisfy myself as to the security of the animals. During the performance of this duty I came to the bivouac of the Indian scouts. "Mitch" Bouyer, the half-breed interpreter, "Bloody Knife," the chief of the Ree scouts, "Half-Yellow-Face," the chief of the Crow scouts, and others were having a "talk." I observed them for a few minutes, when Bouyer turned toward me, apparently at the suggestion of "Half-Yellow-Face," and said, "Have you ever fought against these Sioux?" "Yes," I replied. Then he asked, "Well, how many do you expect to find?" I answered, "It is said we may find between one thousand and fifteen hundred." "Well, do you think we can whip that many?" "Oh, yes, I guess so." After he had interpreted our conversation, he said to me with a good deal of emphasis, "Well, I can tell you we are going to have a — big fight."

At five o'clock, sharp, on the morning of the 23d, General Custer mounted and started up the Rosebud, followed by two sergeants, one

¹ Killed at the battle of Wounded Knee, December 29, 1890.

carrying the regimental standard and the other his personal or headquarters flag, the same kind of flag as used while commanding his cavalry division during the Rebellion. This was the signal for the command to mount and take up the march. Eight miles out we came to the first of the Indian camping-places. It certainly indicated a large village and numerous population. There were a great many "wicki-ups" (bushes stuck in the ground with the tops drawn together, over which they placed canvas or blankets). These we supposed at the time were for the dogs, but subsequent events developed the fact that they were the temporary shelters of the transients from the agencies. During the day we passed through three of these camping-places and made halts at each one. Everybody was busy studying the age of pony droppings and tracks and lodge trails, and endeavoring to determine the number of lodges. These points were the all-absorbing topics of conversation. We went into camp about five o'clock, having marched about thirty-three miles.

June 24th we passed a great many camping-places, all appearing to be of nearly the same strength. One would naturally suppose these were the successive camping-places of the same village, when in fact they were the continuous camps of the several bands. The fact that they appeared to be of nearly the same age, that is, having been made at the same time, did not impress us then. We passed through one much larger than any of the others. The grass for a considerable distance around it had been cropped close, indicating that large herds had been grazed there. The frame of a large "Sun-dance" lodge was standing, and in it we found the scalp of a white man, probably one of General Gibbon's command who had been killed some weeks previously. It was whilst here that the Indians from the agencies had joined the Hostiles' camp. The command halted here and "officers' call" was sounded. Upon assembling we were informed that our Crow scouts, who had been very active and efficient, had discovered fresh signs, the tracks of three or four ponies and of one Indian on foot. At this time a stiff southerly breeze was blowing; as we were about to separate, the General's headquarters flag was blown down, falling toward our rear. Being near the flag, I picked it up and stuck the staff in the ground, but it fell again to the rear. I then bored the staff into the ground where it would have the support of a sage-bush. This circumstance made no impression on me at the time, but after the battle an officer asked me if I remembered the incident; he had observed it, and regarded the fact of its falling to the rear as a bad omen, and felt sure we would suffer a defeat.

The march during the day was tedious. We made many long halts so as not to get ahead of the scouts, who seemed to be doing their work thoroughly, giving special attention to the right, toward Tulloch's Creek, the valley of which was in general view from the divide. Once or twice signal smokes were reported in that direction. The weather was dry and had been for some time, consequently the trail was very dusty. The troops were required to march on separate trails so that the dust clouds would not rise so high. The valley was heavily marked with lodge-pole trails and pony tracks, showing that immense herds of ponies had been driven over it. About sundown we went into camp under the cover of a bluff, so as to hide the command as much as possible. We had marched about twenty-eight miles. The fires were ordered to be put out as soon as supper was over, and we were to be in readiness to march again at 11.30 P. M. Lieutenant Hare and myself lay down about 9.30 to take a nap; when comfortably fixed we heard some one say, "He's over there by that tree." As that described our locality pretty well, I called out to know what was wanted, and the reply came: "The General's compliments and wants to see all the officers at headquarters immediately." So we gave up our much-needed rest and groped our way through horse herds, oversleeping men, and through thickets of bushes trying to find headquarters. No one could tell us, and as all fires and lights were out we could not keep our bearings. We finally espied a solitary candle-light, toward which we traveled, and found most of the officers assembled at the General's bivouac. The General said that the trail led over the divide to the Little Big Horn; the march would be taken up at once, as he was anxious to get as near the divide as possible before daylight, where the command would be concealed during the day, and give ample time for the country to be studied, to locate the village and to make plans for the attack on the 26th. We then returned to our troops, except Lieutenant Hare, who was put on duty with the scouts. Because of the dust it was impossible to see any distance, and the rattle of equipments and clattering of the horses' feet made it difficult to hear distinctly beyond our immediate surroundings. We could not see the trail, and we could only follow it by keeping in the dust cloud. The night was very calm, but occasionally a slight breeze would waft the cloud and disconcert our bearings; then we were obliged to halt to catch a sound from those in advance, sometimes whistling or hallooing, and getting a response we would start forward again. Finally troopers were put ahead, away from the noise of our column, and where they could hear the noise of those

in front. A little after 2 A. M., June 25, the command was halted to await further tidings from the scouts; we had marched about ten miles. Part of the command unsaddled to rest the horses. After daylight some coffee was made, but it was almost impossible to drink it; the water was so alkaline that the horses refused to drink it. Some time before eight o'clock, General Custer rode bareback to the several troops and gave orders to be ready to march at eight o'clock, and gave information that scouts had discovered the locality of the Indian villages or camps in the valley of the Little Big Horn, about twelve or fifteen miles beyond the divide. Just before setting out on the march I went to where General Custer's bivouac was. The General, "Bloody Knife," and several Ree scouts and a half-breed interpreter were squatted in a circle having a "talk," after the Indian fashion. The General wore a serious expression and was apparently abstracted. The scouts were doing the talking, and seemed nervous and disturbed. Finally "Bloody Knife" made a remark that recalled the General from his reverie, and he asked in his usual quick, brusque manner, "What's that he says?" The interpreter replied, "He says we'll find enough Sioux to keep us fighting two or three days." The General smiled and remarked, "I guess we'll get through with them in one day."

We started promptly at eight o'clock and marched uninterruptedly until 10.30 A. M., when we halted in a ravine and were ordered to preserve quiet, keep concealed, and not do anything that would be likely to reveal our presence to the enemy; we had marched about ten miles.

It is a rare occurrence in Indian warfare that gives a commander the opportunity to reconnoiter the enemy's position in daylight. This is particularly true if the Indians have a knowledge of the presence of troops in the country. When following an Indian trail the "signs" indicate the length of time elapsed since the presence of the Indians. When the "signs" indicate a "hot trail," *i. e.*, near approach, the commander judges his distance and by a forced march, usually in the night-time, tries to reach the Indian village at night and make his disposition for a surprise attack at daylight. At all events his attack must be made with celerity, and generally without other knowledge of the numbers of the opposing force than that discovered or conjectured while following the trail. The dispositions for the attack may be said to be "made in the dark," and successful surprise to depend upon luck. If the advance to the attack be made in daylight it is next to impossible that a near approach can be made without discovery. In all our previous

experiences, when the immediate presence of the troops was once known to them, the warriors swarmed to the attack, and resorted to all kinds of ruses to mislead the troops, to delay the advance toward their camp or village, while the squaws and children secured what personal effects they could, drove off the pony herd, and by flight put themselves beyond danger, and then scattering made successful pursuit next to impossible. In civilized warfare the hostile forces may confront each other for hours, days, or weeks, and the battle may be conducted with a tolerable knowledge of the numbers, position, etc., of each other. A full knowledge of the immediate presence of the enemy does not imply immediate attack. In Indian warfare the rule is "touch and go." These remarks are made because the firebrand nature of Indian warfare is not generally understood. In meditating upon the preliminaries of an Indian battle, old soldiers who have participated only in the battles of the Rebellion are apt to draw upon their own experiences for comparison, when there is no comparison.

The Little Big Horn River, or the "Greasy Grass" as it is known to the Indians, is a rapid mountain stream, from twenty to forty yards wide, with pebbled bottom, but abrupt, soft banks. The water at the ordinary stage is from two to five feet in depth, depending upon the width of the channel. The general direction of its course is northeasterly down to the Little Big Horn battle-field, where it trends northwesterly to its confluence with the Big Horn River. The other topographical features of the country which concern us in this narrative may be briefly described as follows: Between the Little Big Horn and Big Horn Rivers is a plateau of undulating prairie; between the Little Big Horn and the Rosebud are the Little Chetish or Wolf Mountains. By this it must not be misunderstood as a rocky upheaval chain or spur of mountains, but it is a rough, broken country of considerable elevation, of high precipitous hills and deep narrow gulches. The command had followed the trail up a branch of the Rosebud to within, say, a mile of the summit of these mountains, which form the "divide." Not many miles to our right was the divide between the Little Big Horn and Tulloch's Fork. The creek that drained the watershed to our right and front is now called "Sundance," or Benteen's, Creek. The trail, very tortuous, and sometimes dangerous, followed down the bed and valley of this creek, which at that time was dry for the greater part of its length. It was from the divide between the Little Big Horn and the Rosebud that the scouts had discovered the smoke rising above the village, and the pony herds grazing in the valley of the Little Big Horn, somewhere about

twelve or fifteen miles away. It was to their point of view that General Custer had gone while the column was halted in the ravine. It was impossible for him to discover more of the enemy than had already been reported by the scouts. In consequence of the high bluffs which screened the village, it was not possible in following the trail to discover more. Nor was there a point of observation near the trail from which further discoveries could be made until the battle was at hand.

It was well known to the Indians that the troops were in the field, and a battle was fully expected by them; but the close proximity of our column was not known to them until the morning of the day of the battle. Several young men had left the hostile camp on that morning to go to one of the agencies in Nebraska. They saw the dust made by the column of troops; some of their number returned to the village and gave warning that the troops were coming, so the attack was not a surprise. For two or three days their camp had been pitched on the site where they were attacked. The place was not selected with the view to making that the battle-field of the campaign, but whoever was in the van on their march thought it a good place to camp, put up his tepee, and the others as they arrived followed his example. It is customary among the Indians to camp by bands. The bands usually camp some distance apart, and Indians of the number then together would occupy a territory of several miles along the river valley, and not necessarily within supporting distance of each other. But in view of the possible fulfilment of Sitting Bull's prophecy the village had massed.

Our officers had generally collected in groups and discussed the situation. Some sought solitude and sleep, or meditation. The Ree scouts, who had not been very active for the past day or two, were together and their "medicine man" was anointing them and invoking the Great Spirit to protect them from the Sioux. They seemed to have become satisfied that we were going to find more Sioux than we could well take care of. Captain Yates's troop had lost one of its packs of hard bread during the night march from our last halting-place on the 24th. He had sent a detail back on the trail to recover it. Captain Keogh came to where a group of officers were, and said this detail had returned and reported that when near the pack they discovered an Indian opening one of the boxes of hard bread with his tomahawk, and that as soon as the Indian saw the soldiers he galloped away to the hills out of range and then moved along leisurely. This information was taken to the General at once by his brother, Colonel Tom Custer. The General came back and had "officers' call" sounded. He recounted Captain

Keogh's report, and also said that the scouts had seen several Indians moving along the ridge overlooking the valley through which we had marched, as if observing our movements; he thought the Indians must have seen the dust made by the command. At all events our presence had been discovered and further concealment was unnecessary; that we would march at once to attack the village; that he had not intended to make the attack until the next morning, the 26th, but our discovery made it imperative to act at once, as delay would allow the village to scatter and escape. Troop commanders were ordered to make a detail of one non-commissioned officer and six men to accompany the pack; to inspect their troops and report as soon as they were ready to march; that the troops would take their places in the column of march in the order in which reports of readiness were received, and that the last one to report would escort the pack-train.

The inspections were quickly made and the column was soon en route. We crossed the dividing ridge between the Rosebud and Little Big Horn valleys a little before noon. Shortly afterward the regiment was divided into battalions. The advance battalion, under Major Reno, consisted of troop "M," Captain French; troop "A," Captain Moylan and Lieutenant De Rudio; troop "G," Lieutenants McIntosh and Wallace; the Indian scouts under Lieutenants Varnum and Hare and the interpreter Girard; Lieutenant Hodgson was Acting Adjutant and Doctors De Wolf and Porter were the medical officers. The battalion under General Custer was composed of troop "I," Captain Keogh and Lieutenant Porter; troop "F," Captain Yates and Lieutenant Reily; troop "C," Captain Custer and Lieutenant Harrington; troop "E," Lieutenants Smith and Sturgis; troop "L," Lieutenants Calhoun and Crittenden; Lieutenant Cook was the Adjutant, and Dr. G. E. Lord was medical officer. The battalion under Captain Benteen consisted of troop "H," Captain Benteen and Lieutenant Gibson; troop "D," Captain Weir and Lieutenant Edgerly, and troop "K," Lieutenant Godfrey. The pack-train, Lieutenant Mathey in charge, was under the escort of troop "B," Captain McDougall.

Major Reno's battalion marched down a valley that developed into the small tributary to the Little Big Horn, now called "Sun-dance," or Benteen's, Creek. The Indian trail followed the meanderings of this valley. Custer's column followed Reno's closely, and the pack-train followed their trail. Benteen's battalion was ordered to the left and front, to a line of high bluffs about three or four miles distant. Benteen was ordered if he saw anything to send word to Custer, but to pitch into anything he

"BOOTS AND SADDLES."

came across; if, when he arrived at the high bluffs, he could not see any enemy, he should continue his march to the next line of bluffs and so on, until he could see the Little Big Horn Valley. He marched over a succession of rough, steep hills and deep valleys. The view from the point where the regiment was organized into battalions did not discover the difficult nature of the country, but as we advanced farther it became more and more difficult and more forbidding. Lieutenant Gibson was sent some distance in advance but saw no enemy, and so signaled the result of his reconnaissance to Benteen. The obstacles threw the battalion by degrees to the right until we came in sight of and not more than a mile from the trail. Many of our horses were greatly jaded by the climbing and descending, some getting far to the rear of the column. Benteen very wisely determined to follow the trail of the rest of the command, and we got into it just in advance of the pack-train. During this march on the left we could see occasionally the battalion under Custer, distinguished by the troop mounted on gray horses, marching at a rapid gait. Two or three times we heard loud cheering and also some few shots, but the occasion of these demonstrations is not known.

Some time after getting on the trail we came to a water-hole, or morass, at which a stream

of running water had its source. Benteen halted the battalion. While watering we heard some firing in advance, and Weir became a little impatient at the delay of watering and started off with his troop, taking the advance, whereas his place in column was second. The rest of the battalion moved out very soon afterward and soon caught up with him. Just as we were leaving the water-hole the pack-train was arriving, and the poor thirsty mules plunged into the morass in spite of the efforts of the packers to prevent them, for they had not had water since the previous evening. We passed a burning tepee, fired presumably by our scouts, in which was the body of a warrior who had been killed in the battle with Crook's troops on the Rosebud on the 17th of June.

The battalions under Reno and Custer did not meet any Indians until Reno arrived at the burning tepee; here a few were seen. These Indians did not act as if surprised by the appearance of troops; they made no effort to delay the column, but simply kept far enough in advance to invite pursuit. Reno's command and the scouts followed them closely, until he received orders "to move forward at as rapid a gait as he thought prudent, and charge the village afterward, and the whole outfit would support him." The order was received when Reno was not very far from the Little Big Horn

RENO'S CROSSING, IN RETREAT, THE BLUFF WHERE HE WAS BESIEGED APPEARING ON THE RIGHT.
(FROM A PHOTOGRAPH BY D. F. BARRY.)

toward the foot-hills on the left flank where the Reescouts were. The scouts ignominiously fled, most of them abandoning the field altogether.

Reno, not seeing the "whole outfit" within supporting distance, did not obey his orders to charge the village, but dismounted his command to fight on foot. The movements of the Indians around the left flank and the flight of the scouts caused the left to fall back until the command was on the defensive in the timber and covered by the bank of the old river-bed. Reno's loss thus far was one wounded. The position was a strong one, well protected in front by the bank and fringe of timber, somewhat open in the rear, but sheltered by timber in the bottom. Those present differ in their estimates of the length of time the command remained in the bottom after they were attacked in force. Some say "a few minutes"; others, "about an hour." While Reno remained there his casualties were few. The Hostiles had him nearly surrounded, and there was some firing from the rear of the position by Indians on the opposite bank of the river. One man was killed close to where Reno was, and directly afterward Reno gave orders to those near him to "mount and get to the bluffs." This order was not generally heard or communicated; while those who did hear it were preparing to execute it, he countermanded the order, but soon afterward he repeated the same order, "to mount and get to the bluffs," and again it was not generally understood. Individuals, observing

the preparations of those on the left, near Reno, informed their troop commanders, who then gave orders to mount. Owing to the noise of the firing and to the absorbed attention they were giving to the enemy, many did not know of the order until too late to accompany the command. Some remained concealed until the Indians left and then came out. Four others remained until night and then escaped. Reno's command left the bottom by troop organizations in column. Reno was with the foremost in this retreat or "charge," as he termed it in his report, and after he had exhausted the shots of his revolvers he threw them away. The hostile strength pushed Reno's retreat to the left, so he could not get to the ford where he had entered the valley, but they were fortunate in striking the river at a fordable place; a pony-trail led up a funnel-shaped ravine into the bluffs. Here the command got jammed and lost all semblance of organization. The Indians fired into them, but not very effectively. There does not appear to have been any resistance, certainly no organized resistance, during this retreat. On the right and left of the ravine into which the pony-path led were rough precipitous clay bluffs. It was surprising to see what steep inclines men and horses clambered up under the excitement of danger.

Lieutenant Donald McIntosh was killed soon after leaving the timber. Dr. De Wolf was killed while climbing one of the bluffs a short distance from the command. Lieutenant B. H. Hodgson's horse leaped from the bank into

the river and fell dead; the lieutenant was wounded in the leg, probably by the same bullet that killed the horse. Hodgson called out, "For God's sake, don't abandon me"; he was assured that he would not be left behind. Hodgson then took hold of a comrade's stirrup-strap and was taken across the stream, but soon after was shot and killed. Hodgson, some days before the battle, had said that if he was dismounted in battle or wounded, he intended to take hold of somebody's stirrup to assist himself from the field. During the retreat Private Dalvern, troop "F," had a hand-to-hand conflict with an Indian; his horse was killed; he then shot the Indian, caught the Indian's pony, and rode to the command.

Reno's casualties thus far were three officers, including Dr. J. M. De Wolf, and twenty-nine enlisted men and scouts killed; seven enlisted men wounded; and one officer, one interpreter, and fourteen soldiers and scouts missing. Nearly all the casualties occurred during the retreat and after leaving the timber. The Ree scouts continued their flight until they reached the supply camp at the mouth of the Powder, on the 27th. The Crow scouts remained with the command.

CAVALRY OFFICER IN CAMPAIGN DRESS.

We will now go back to Benteen's battalion. Not long after leaving the water-hole a sergeant met him with an order from Custer to the commanding officer of the pack-train to hurry it up. The sergeant was sent back to the train with the message; as he passed the column he said to the men, "We 've got 'em, boys." From this and other remarks we inferred that Custer had attacked and captured the village.

Shortly afterward we were met by a trumpeter bearing this message signed by Colonel Cook, Adjutant: "Benteen, come on. Big village. Be quick. Bring packs," with the postscript, "Bring packs." The column had been marching at a trot and walk, according as the ground was smooth or broken. We now heard firing, first straggling shots, and as we advanced the engagement became more and more pronounced and appeared to be coming toward us. The column took the gallop with pistols drawn, expecting to meet the enemy which we thought Custer was driving before him in his effort to communicate with the pack-train, never suspecting that our force had been defeated. We were forming in line to meet our supposed enemy, when we came in full view of the valley of the Little Big Horn. The valley was full of horsemen riding to and fro in clouds of dust and smoke, for the grass had been fired by the Indians to drive the troops out and cover their own movements. On the bluffs to our right we saw a body of troops and that they were engaged. But an engagement appeared to be going on in the valley too. Owing to the distance, smoke, and dust, it was impossible to distinguish if those in the valley were friends or foes. There was a short time of uncertainty as to the direction in which we should go, but some Crow scouts came by, driving a small herd of ponies, one of whom said "Soldiers," and motioned for the command to go to the right. Following his directions, we soon joined Reno's battalion, which was still firing. Reno had lost his hat and had a handkerchief tied about his head, and appeared to be very much excited.

Benteen's battalion was ordered to dismount and deploy as skirmishers on the edge of the bluffs overlooking the valley. Very soon after this the Indians withdrew from the attack. Lieutenant Hare came to where I was standing and, grasping my hand heartily, said with a good deal of emphasis: "We 've had a big fight in the bottom, got whipped, and I am — glad to see you." I was satisfied that he meant what he said, for I had already suspected that something was wrong, but was not quite prepared for such startling information. Benteen's battalion was ordered to divide its ammunition with Reno's men, who had apparently expended nearly all in their per-

sonal possession. It has often been a matter of doubt whether this was a fact, or the effect of imagination. It seems most improbable, in view of their active movements and the short time the command was firing, that the "most of the men" should have expended one hundred and fifty rounds of ammunition per man.

While waiting for the ammunition pack-mules, Major Reno concluded to make an effort to recover and bury the body of Lieutenant Hodgson. At the same time we loaded up a few men with canteens to get water for the command; they were to accompany the rescuing party. The effort was futile; the party was ordered back after being fired upon by some Indians who doubtless were scalping the dead near the foot of the bluffs.

A number of officers collected on the edge of the bluff overlooking the valley and were discussing the situation; among our number was Captain Moylan, a veteran soldier, and a good one too, watching intently the scene below. Moylan remarked, quite emphatically: "Gentlemen, in my opinion General Custer has made the biggest mistake of his life, by not taking the whole regiment in at once in the first attack." At this time there were a large number of horsemen, Indians, in the valley. Suddenly they all started down the valley, and in a few minutes scarcely a horseman was to be seen. Heavy firing was heard down the river. During this time the questions were being asked: "What's the matter with Custer, that he don't send word what we shall do?" "Wonder what we are staying here for?" etc., thus showing some uneasiness; but still no one seemed to show great anxiety, nor do I know that any one felt any serious apprehension but that Custer could and would take care of himself. Some of Reno's men had seen a party of Custer's command, including Custer himself, on the bluffs about the time the Indians began to develop in Reno's front. This party was heard to cheer, and seen to wave their hats as if to give encouragement, and then they disappeared behind the hills or escaped further attention from those below. It was about the time of this incident that Trumpeter Martini left Cook with Custer's last orders to Benteen, viz.: "Benteen, come on. Big village. Be quick. Bring packs. Cook, Adjutant. P. S. Bring packs." The repetition in the order would seem to indicate that Cook was excited, flurried, or that he wanted to emphasize the necessity for escorting the packs. It is possible, yes probable, that from the high point Custer could then see nearly the whole camp and force of the Indians and realized that the chances were desperate; but it was too late

to reunite his forces for the attack. Reno was already in the fight and his (Custer's) own battalion was separated from the attack by a distance of two and a half to three miles. He had no reason to think that Reno would not push his attack vigorously. A commander seldom goes into battle counting upon the failure of

LIEUTENANT B. H. HODGSON,
ACTING ADJUTANT.

LIEUTENANT DONALD MCINTOSH,
COMMANDING TROOP "G."

OFFICERS WITH RENO, WHO WERE KILLED.

his lieutenant; if he did, he certainly would provide that such failure should not turn into disaster.

During a long time after the junction of Reno and Benteen we heard firing down the river in the direction of Custer's command. We were satisfied that Custer was fighting the Indians somewhere, and the conviction was expressed that "our command ought to be doing something or Custer would be after Reno with a sharp stick." We heard two distinct volleys which excited some surprise, and, if I mistake not, brought out the remark from some one that "Custer was giving it to them for all he was worth." I have but little doubt now that these volleys were fired by Custer's orders as signals of distress and to indicate where he was.

Captain Weir and Lieutenant Edgerly, after driving the Indians away from Reno's command, on their side, heard the firing, became impatient at the delay, and thought they would move down that way, if they should be permitted. Weir started to get this permission, but changed his mind and concluded to take a survey from the high bluffs first. Edgerly, seeing Weir going in the direction of the firing, supposed it was all right and started down the ravine with the troop. Weir, from the high point, saw the Indians in large numbers start for Edgerly, and signaled for him to change his direction, and Edgerly went over to the high point, where they remained, not seriously molested, until the remainder of the troops marched down there; the Indians were seen by them to ride about what afterward proved to be Custer's battle-field, shooting into the bodies of the dead men.

McDougall came up with the pack-train and reported the firing when he reported his arrival

GENERAL CUSTER IN HIS BUCKSKIN SUIT.

This was his dress on his last campaign, with cavalry boots and sombrero added. The portrait is from a photograph of General Custer and the Grand Duke Alexis, taken at the time of their hunting expedition, not long before General Custer's death.

Indians, but they drove them away and were not again molested.

My recollection is that it was about half-past two when we joined Reno. About five o'clock the command moved down toward Custer's supposed whereabouts, intending to join him. The advance went as far as the high bluffs where the command was halted. Persons who have been on the plains and have seen stationary objects dancing before them, now in view and now obscured, or a weed on the top of a hill, projected against the sky, magnified to appear as a tree, will readily understand why our views would be unsatisfactory. We could see stationary groups of horsemen, and individual horsemen moving about; from their grouping and the manner in which they sat their horses we knew they were Indians. On the left of the valley a strange sight attracted our attention. Some one remarked that there had been a fire that scorched the leaves of the bushes, which caused the reddish-brown appearance, but this appearance was changeable; watching this intently for a short time with field-glasses, it was discovered that this strange sight was the immense pony-herds of the Indians.

Looking toward Custer's field, on a hill two miles away we saw a large assemblage. At first our command did not appear to attract their attention, although there was some commotion observable among those nearer to our position. We heard occasional shots, most of which seemed to be a great distance off, beyond the large groups on the hill. While watching this group the conclusion was arrived at that Custer had been repulsed, and the firing was the parting shots of the rear-guard. The

to Reno. I remember distinctly looking at my watch at twenty minutes past four, and made a note of it in my memorandum-book, and although I have never satisfactorily been able to recall what particular incident happened at that time, it was some important event before we started down the river. It is my impression, however, that it was the arrival of the pack-train. It was about this time that thirteen men and a scout named Herendeen rejoined the command; they had been missing since Reno's flight from the bottom; several of them were wounded. These men had lost their horses in the stampede from the bottom and had remained in the timber; when leaving the timber to rejoin, they were fired upon by five

firing ceased, the groups dispersed, clouds of dust arose from all parts of the field, and the horsemen converged toward our position. The command was now dismounted to fight on foot. Weir's and French's troops were posted on the high bluffs and to the front of them; my own troop along the crest of the bluffs next to the river; the rest of the command moved to the rear, as I supposed to occupy other points in the vicinity, to make this our defensive position. Busying myself with posting my men, giving direction about the use of ammunition, etc., I was a little startled by the remark that the command was out of sight. At this time Weir's and French's troops were being attacked. Orders were soon brought to me by Lieutenant Hare,

Acting-Adjutant, to join the main command. I had gone some distance in the execution of this order when, looking back, I saw French's troop come tearing over the bluffs, and soon after Weir's troop followed in hot haste. Eagerly was near the top of the bluff trying to mount his frantic horse, and it did seem that he would not succeed, but he vaulted into his saddle and then joined the troop. The Indians almost immediately followed to the top of the bluff, and commenced firing into the retreating troops, killing one man, wounding others and several horses. They then started down the hillside in pursuit. I at once made up my mind that such a retreat and close pursuit would throw the whole command into confusion, and, perhaps, prove disastrous. I dismounted my men to fight on foot, deploying as rapidly as possible without waiting for the formation laid down in tactics. Lieutenant Hare expressed his intention of staying with me, "Adjutant or no Adjutant." The led horses were sent to the main command. Our fire in a short time compelled the Indians to halt and take cover, but before this was accomplished, a second order came for me to fall back as quickly as possible to the main command. Having checked the pursuit we began our retreat, slowly at first, but kept up our firing. After proceeding some distance the men began to group together, and to move a little faster and faster, and our fire slackened. This was pretty good evidence that they were getting demoralized. The Indians were being heavily reinforced, and began to come from their cover, but kept up a heavy fire. I halted the line, made the men take their intervals, and again drove the Indians to cover; then once more began the retreat. The firing of the Indians was very heavy; the bullets struck the ground all about us; but the "ping-ping" of the bullets overhead seemed to have a more terrifying influence than the "swish-thud" of the bullets that struck the ground immediately about us. When we got to the ridge in front of Reno's position I observed some Indians making all haste to get possession of a hill to the right. I could now see the rest of the command, and I knew that that hill would command Reno's position. Supposing that my troop was to occupy the line we were then on, I ordered Hare to take ten men and hold the hill, but, just as he was moving off, an order came from Reno to get back as quickly as possible; so I recalled Hare and ordered the men to run to the lines. This movement was executed, strange to say, without a single casualty.

The Indians now took possession of all the surrounding high points, and opened a heavy fire. They had in the mean time sent a large

force up the valley, and soon our position was entirely surrounded. It was now about seven o'clock.

Our position next the river was protected by the rough, rugged steep bluffs which were cut up by irregular deep ravines. From the crest of these bluffs the ground gently declined away from the river. On the north there was a short ridge, the ground sloping gently to the front and rear. This ridge, during the first day, was occupied by five troops. Directly in rear of the ridge was a small hill; in the ravine on the south of this hill our hospital was established, and the horses and pack-mules were secured. Across this ravine one troop, Moylan's, was posted, the packs and dead animals being utilized for breastworks. The high hill on the south was occupied by Benteen's troop. Everybody now lay down and spread himself out as thin as possible. After lying there a few minutes I was horrified to find myself wondering if a small sage-bush, about as thick as my finger, would turn a bullet, so I got up and walked along the line, cautioned the men not to waste their ammunition; ordered certain men who were good shots to do the firing, and others to keep them supplied with loaded guns.

The firing continued till nearly dark (between nine and ten o'clock), although after dusk but little attention was paid to the firing, as everybody moved about freely.

Of course everybody was wondering about Custer—why he did not communicate by courier or signal. But the general opinion seemed to prevail that he had been defeated and driven down the river, where he would probably join General Terry, and with whom he would return to our relief. Quite frequently, too, the question, "What's the matter with Custer?" would evoke an impatient reply.

Indians are proverbial economists of fuel, but they did not stint themselves that night. The long twilight was prolonged by numerous bonfires, located throughout their village. The long shadows of the hills and the refracted light gave a supernatural aspect to the surrounding country, which may account for the illusions of those who imagined they could see columns of troops, etc. Although our dusky foes did not molest us with obtrusive attentions during the night, yet it must not be inferred that we were allowed to pass the night in perfect rest; or that they were endeavoring to soothe us into forgetfulness of their proximity, or trying to conceal their situation. They were a good deal happier than we were; nor did they strive to conceal their joy. Their camp was a veritable pandemonium. All night long they continued their frantic revels; beating tom-toms, dancing,

DISMOUNTED — THE FOURTH TROOPERS MOVING THE LED HORSES.

J. H. M. M. M.

whooping, yelling with demoniacal screams, and discharging firearms. We knew they were having a scalp-dance. In this connection the question has often been asked "if they did not have prisoners at the torture?" The Indians deny that they took any prisoners. We did not discover any evidence of torture in their camps. It is true that we did find human heads severed from their bodies, but these probably had been paraded in their orgies during that terrible night.

Our casualties had been comparatively few since taking position on the hill. The question of moving was discussed, but the conditions coupled to the proposition caused it to be indignantly rejected. Some of the scouts were sent out soon after dark to look for signs of Custer's command, but they returned after a short absence saying that the country was full of Sioux. Lieutenant Varnum volunteered to go out, but was either discouraged from the venture or forbidden to go out.

After dark the troops were arranged a little differently. The horses were unsaddled, and the mules were relieved of their packs; all animals were secured to lariats stretched and picketed to the ground.

Soon after all firing had ceased the wildest confusion prevailed. Men imagined they could see a column of troops over on the hills or ridges, that they could hear the tramp of the horses, the command of officers, or even the trumpet-calls. Stable-call was sounded by one of our trumpeters; shots were fired by some of our men, and familiar trumpet-calls were sounded by our trumpeter immediately after, to let the supposed marching column know that we were friends. Every favorable expression or opinion was received with credulity, and then ratified with a cheer. Somebody suggested that General Crook might be coming, so some one, a civilian packer, I think, mounted a horse, and galloping along the line yelled: "Don't be discouraged, boys, Crook is coming." But they gradually realized that the much-wished-for reinforcements were but the phantasma of their imaginations, and settled down to their work of digging rifle-pits. They worked in pairs, in threes and fours. The ground was hard and dry. There were only three or four spades and shovels in the whole command; axes, hatchets, knives, table-forks, tin cups, and halves of canteens were brought into use. However, everybody worked hard, and some were still digging when the enemy opened fire at early dawn, between half-past two and three o'clock, so that all had some sort of shelter, except Benteen's men. The enemy's first salutations were rather feeble, and our side made scarcely any response; but as dawn advanced to daylight their lines

were heavily reinforced, and both sides kept up a continuous fusillade. Of course it was their policy to draw our fire as much as possible to exhaust our ammunition. As they exposed their persons very little we forbade our men, except well-known good shots, to fire without orders. The Indians amused themselves by standing erect, in full view for an instant, and then dropping down again before a bullet could reach them, but of that they soon seemed to grow tired or found it too dangerous; then they resorted to the old ruse of raising a hat and blouse, or a blanket, on a stick to draw our fire; we soon understood their tactics. Occasionally they fired volleys at command. Their fire, however, was not very effective. Benteen's troop suffered greater losses than any other, because their rear was exposed to the long-range firing from the hills on the north. The horses and mules suffered greatly, as they were fully exposed to long-range fire from the east.

Benteen came over to where Reno was lying, and asked for reinforcements to be sent to his line. Before he left his line, however, he ordered Gibson not to fall back under any circumstances, as this was the key of the position. Gibson's men had expended nearly all their ammunition, some men being reduced to as few as four or five cartridges. He was embarrassed, too, with quite a number of wounded men. Indeed, the situation here was most critical, for if the Indians had made a rush, a retreat was inevitable. Private McDermott volunteered to carry a message from Gibson to Benteen urging him to hasten the reinforcements. After considerable urging by Benteen, Reno finally ordered French to take "M" troop over to the south side. On his way over Benteen picked up some men then with the horses. Just previous to his arrival an Indian had shot one of Gibson's men, then rushed up and touched the body with his "coup-stick," and started back to cover, but he was killed. He was in such close proximity to the lines and so exposed to the fire that the other Indians could not carry his body away. This, I believe, was the only dead Indian left in our possession. This boldness determined Benteen to make a charge, and the Indians were driven nearly to the river. On their retreat they dragged several dead and wounded warriors away with them.

The firing almost ceased for a while, and then it recommenced with greater fury. From this fact, and their more active movements, it became evident that they contemplated something more serious than a mere fusillade. Benteen came back to where Reno was, and said if something was not done pretty soon the Indians would run into our lines. Waiting a short

UNHORSED.

time, and no action being taken on his suggestion, he said rather impatiently: "You've got to do something here pretty quick; this won't do, you must drive them back." Reno then directed us to get ready for a charge, and told Benteen to give the word. Benteen called out "All ready now, men. Now's your time. Give them hell. Hip, hip, here we go!" and away we went with a hurrah, every man, but one who lay in his pit crying like a child. The Indians fired more rapidly than before from their whole line. Our men left the pits with their carbines loaded, and they began firing without orders soon after we started. A large body of Indians had assembled at the foot of one of the hills, intending probably to make a charge, as Benteen had divined, but they broke as soon as our line started. When we had advanced 75 or 100 yards, Reno called out "Get back, men, get back," and back the whole line came. A most singular fact of this sortie was that not a man who advanced with the lines was hit; but directly after every one had gotten into the pits again, the one man who did not go out was shot in the head and killed instantly. The poor fellow had a premonition that he would be killed, and had so told one of his comrades.

Up to this time the command had been without water. The excitement and heat made our thirst almost maddening. The men were forbidden to use tobacco. They put pebbles in their mouths to excite the glands; some ate

grass roots, but did not find relief; some tried to eat hard bread, but after chewing it awhile would blow it out of their mouths like so much flour. A few potatoes were given out and afforded some relief. About 11 A. M. the firing was slack, and parties of volunteers were formed to get water under the protection of Benteen's lines. The parties worked their way down the ravines to within a few yards of the river. The men would get ready, make a rush to the river, fill the camp-kettles, and return to fill the canteens. Some Indians stationed in a copse of woods, a short distance away, opened fire whenever a man exposed himself, which made this a particularly hazardous service. Several men were wounded, and the additional danger was then incurred of rescuing their wounded comrades. I think all these men were rewarded with medals of honor. By about one o'clock the Indians had nearly all left us, but they still guarded the river; by that time, however, we had about all the water we needed for immediate use. About two o'clock the Indians came back, opened fire, and drove us to the trenches again, but by three o'clock the firing had ceased altogether.

Late in the afternoon we saw a few horsemen in the bottom apparently to observe us, and then fire was set to the grass in the valley. About 7 P. M. we saw emerge from behind this screen of smoke an immense moving mass crossing the plateau, going toward the Big

Horn Mountains. A fervent "Thank God" that they had at last given up the contest was soon followed by grave doubts as to their motive for moving. Perhaps Custer had met Terry, and was coming to our relief. Perhaps they were short of ammunition, and were moving their village to a safe distance before making a final desperate effort to overwhelm us. Perhaps it was only a ruse to get us on the move, and then clean us out.

The stench from the dead men and horses was now exceedingly offensive, and it was decided to take up a new position nearer the river. The companies were assigned positions, and the men were put to work digging pits with the expectation of a renewal of the attack. Our loss on the hill had been eighteen killed and fifty-two wounded.

During the night Lieutenant De Rudio, Private O'Neal, Mr. Girard, the interpreter, and Jackson, a half-breed scout, came to our line. They had been left in the bottom when Reno made his retreat.

In this narrative of the movements immediately preceding, and resulting in, the annihilation of the men with Custer, I have related facts substantially as observed by myself or as given to me by Chief Gall of the Sioux. His statements have been corroborated by other Indians, notably the wife of "Spotted Horn Bull," an intelligent Sioux squaw, one of the first who had the courage to talk freely to any one who participated in the battle.

In 1886, on the tenth anniversary, an effort was made to have a reunion of the survivors at the battle-field. Colonel Benteen, Captains McDougall and Edgerly, Dr. Porter, Sergeant Hall, Trumpeter Penwell, and myself met there on the 25th of June. Through the kind efforts of the officers and of the ladies at Fort Custer our visit was made as pleasant as possible. Through the personal influence of Major McLaughlin, Indian agent at Standing Rock Agency, Chief Gall was prevailed upon to accompany the party and describe Custer's part in the battle. We were unfortunate in not having an efficient and truthful interpreter on the field at the reunion. The statements I have used were, after our return to the agency, interpreted by Mrs. McLaughlin and Mr. Faribault, of the agency, both of whom are perfectly trustworthy and are familiar with the Sioux language.

It has been previously noted that General Custer separated from Reno before the latter crossed the Little Big Horn under orders to charge the village. Custer's column bore to the right of the river (a sudden change of plan, probably); a ridge of high bluffs and the river separated the two commands, and they could not see each other. On this ridge, however, Custer and staff were seen to wave their hats, and

heard to cheer just as Reno was beginning the attack; but Custer's troops were at that time a mile or more to his right. It was about this time that the trumpeter was sent back with Custer's last order to Benteen. From this place [see A on map] Custer could survey the valley for several miles above and for a short distance below Reno; yet he could only see a part of the village; he must, then, have felt confident that all the Indians were below him; hence, I presume, his message to Benteen. The view of the main body of the village was cut off by the highest points of the ridge, a short distance from him. Had he gone to this high point he would have understood the magnitude of his undertaking, and it is probable that his plan of battle would have been changed. We have no evidence that he did not go there. He could see, however, that the village was not breaking away toward the Big Horn Mountains. He must, then, have expected to find the squaws and children fleeing to the bluffs on the north, for in no other way do I account for his wide detour to the right. He must have counted upon Reno's success, and fully expected the "scattering" of the non-combatants with the pony herds. The probable attack upon the families and the capture of the herds were in that event counted upon to strike consternation in the hearts of the warriors, and were elements for success upon which General Custer fully counted in the event of a daylight attack.

When Reno's advance was checked, and his left began to fall back, Chief Gall started with some of his warriors to cut off Reno's retreat to the bluffs. On his way he was excitedly hailed by "Iron Cedar," one of his warriors, who was on the high point, to hurry to him, that more soldiers were coming. This was the first intimation the Indians had of Custer's column; up to the time of this incident they had supposed that all the troops were in at Reno's attack. Custer had then crossed the valley of the dry creek, and was marching along and well up the slope of the bluff forming the second ridge back from the river, and nearly parallel to it. The command was marching rapidly in column of fours, and there was some confusion in the ranks, due probably to the unmanageableness of some excited horses.

The accepted theory for many years after the battle, and still persisted in by some writers, was that Custer's column had turned the high bluffs near the river, moved down the dry (Reno's) creek, and attempted to ford the river near the lowest point of these bluffs; that he was there met by an overpowering force and driven back; that he then divided his battalion, moved down the river with the view of attacking the village, but met with such resistance

CAPTAIN M. W. KEOGH, COMMANDING TROOP "I."

from the enemy posted along the river bank and ravines that he was compelled to fall back, fighting, to the position on the ridge. The numerous bodies found scattered between the river and ridge were supposed to be the first victims of the fight. I am now satisfied that these were men who either survived those on the ridge or attempted to escape the massacre.

Custer's route was as indicated on the map, and his column was never nearer the river or village than his final position on the ridge. The wife of Spotted Horn Bull, when giving me her account of the battle, persisted in saying that Custer's column did not attempt to cross at the ford, and appealed to her husband, who supported her statement. On the battle-field, in 1886, Chief Gall indicated Custer's route to me, and it then flashed upon me that I myself had seen Custer's trail. On June 28, while we were burying the dead, I asked Major Reno's permission to go on the high ridge east or back of the field to look for tracks of shod horses to ascertain if some of the command might not have escaped. When I reached the ridge I saw this trail, and wondered who could have made it, but dismissed the thought that it had been made by Custer's column, because it did not accord with the theory with which we were then filled, that Custer had attempted to cross at the ford, and this trail was too far back, and showed no indication of leading

toward the ford. Trumpeter Penwell was my orderly and accompanied me. It was a singular coincidence that in 1886 Penwell was stationed at Fort Custer, and was my orderly when visiting the battle-field. Penwell corroborated my recollection of the trail.

The ford theory arose from the fact that we found there numerous tracks of shod horses, but they evidently had been made after the Indians had possessed themselves of the cavalry horses, for they rode them after capturing them. No bodies of men or horses were found anywhere near the ford, and these facts are conclusive to my mind that Custer did not go to the ford with any body of men.

As soon as Gall had personally confirmed Iron Cedar's report he sent word to the warriors battling against Reno, and to the people in the village. The greatest consternation prevailed among the families, and orders were given for them to leave at once. Before they could do so the great body of warriors had left Reno, and hastened to attack Custer. This explains why Reno was not pushed when so much confusion at the river crossing gave the Indians every opportunity of annihilating his command. Not long after the Indians began to show a strong force in Custer's front, Custer turned his column to the left, and advanced in the direction of the village to near a place now marked as a spring, halted at the junction of the ravines just below it, and dismounted two troops, Keogh's and Calhoun's, to fight on foot. These two troops advanced at double-time to a knoll, now marked by Crittenden's monument. The other three troops, mounted, followed them a short distance in their rear. The led horses remained where the troops dismounted. When Keogh and Calhoun got to the knoll the other troops marched rapidly to

CAPTAIN G. W. YATES, COMMANDING TROOP "F."

the right; Smith's troop deployed as skirmishers, mounted, and took position on a ridge, which, on Smith's left, ended in Keogh's position (now marked by Crittenden's monument), and, on Smith's right, ended at the hill on which Custer took position with Yates and Tom Custer's troops, now known as Custer's Hill, and marked by the monument erected to the command. Smith's skirmishers, holding their gray horses, remained in groups of fours.

The line occupied by Custer's battalion was the first considerable ridge back from the river, the nearest point being about half a mile from it. His front was extended about three fourths of a mile. The whole village was in full view. A few hundred yards from his line was another but lower ridge, the further slope of which was not commanded by his line. It was here that the Indians under Crazy Horse from the lower part of the village, among whom were the Cheyennes, formed for the charge on Custer's Hill. All Indians had now left Reno. Gall collected his warriors, and moved up a ravine south of Keogh and Calhoun. As they were turning this flank they discovered the led horses without any other guard than the horse-holders. They opened fire upon the horse-holders, and used the usual devices to stampede the horses—that is, yelling, waving blankets, etc.; in this they succeeded very soon, and the horses were caught up by the squaws. In this disaster Keogh and Calhoun probably lost their reserve ammunition, which was carried in the saddle-bags. Gall's warriors now moved to the foot of the knoll held by Calhoun. A large force dismounted and advanced up the slope far enough to be able to see the soldiers when standing erect, but were protected when squatting or lying down. By jumping up and firing quickly, they exposed themselves only for an instant, but drew the fire of the soldiers, causing a waste of ammunition. In the mean time Gall was massing his mounted warriors under the protection of the slope. When everything was in readiness, at a signal from Gall the dismounted warriors rose, fired, and every Indian gave voice to the war-whoop; the mounted Indians put whip to their ponies, and the whole mass rushed upon and crushed Calhoun. The maddened mass of Indians was carried forward by its own momentum over Calhoun and Crittenden down into the depression where Keogh was, with over thirty men, and all was over on that part of the field.

In the mean time the same tactics were being pursued and executed around Custer's Hill. The warriors, under the leadership of Crow-King, Crazy Horse, White Bull, "Hump," and others, moved up the ravine west of Custer's Hill, and concentrated under the shelter of the ridges on his right flank and back of his posi-

tion. Gall's bloody work was finished before the annihilation of Custer was accomplished, and his victorious warriors hurried forward to the hot encounter then going on, and the frightful massacre was completed.

Smith's men had disappeared from the ridge, but not without leaving enough dead bodies to mark their line. About twenty-eight bodies of men belonging to this troop and other organizations were found in one ravine nearer the river. Many corpses were found scattered

CAPTAIN T. W. CUSTER, COMMANDING TROOP "C."

over the field between Custer's line of defense, the river, and in the direction of Reno's Hill. These, doubtless, were of men who had attempted to escape; some of them may have been sent as couriers by Custer. One of the first bodies I recognized and one of the nearest to the ford was that of Sergeant Butler of Tom Custer's troop. Sergeant Butler was a soldier of many years' experience and of known courage. The indications were that he had sold his life dearly, for near and under him were found many empty cartridge-shells.

All the Indian accounts that I know of agree that there was no organized close-quarters fighting, except on the two flanks; that with the annihilation at Custer's Hill the battle was virtually over. It does not appear that the Indians made any advance to the attack from the direction of the river; they did have a defensive force along the river and in the ravines which destroyed those who left Custer's line.

There was a great deal of firing going on over the field after the battle by the young men and boys riding about and shooting into the dead bodies.

PORTRAITS (ON THIS AND THE TWO PREVIOUS PAGES) OF OFFICERS WHO DIED WITH CUSTER.

These portraits are from photographs, or copies, for the most part by D. F. Barry of West Superior, Wis., who has taken many pictures of the Custer battle-field. Those of Lieutenants Reily and Sturgis are by Scholten, St. Louis, and Pach, New York.

Tuesday morning, June 27, we had reveille without the "morning guns," enjoyed the pleasure of a square meal, and had our stock properly cared for. Our commanding officer seemed to think the Indians had some "trap" set for us, and required our men to hold themselves in readiness to occupy the pits at a moment's notice. Nothing seemed determined except to stay where we were. Not an Indian was in sight, but a few ponies were seen grazing down in the valley.

About 9.30 A. M. a cloud of dust was observed several miles down the river. The assembly was sounded, the horses were placed in a protected situation, and camp-kettles and

canteens were filled with water. An hour of suspense followed; but from the slow advance we concluded that they were our own troops. "But whose command is it?" We looked in vain for a gray-horse troop. It could not be Custer; it must then be Crook, for if it was Terry, Custer would be with him. Cheer after cheer was given for Crook. A white man, Harris, I think, soon came up with a note from General Terry, addressed to General Custer, dated June 26, stating that two of our Crow scouts had given information that our column had been whipped and nearly all had been killed; that he did not believe their story, but was coming with medical assistance. The scout

said that he could not get to our lines the night before, as the Indians were on the alert. Very soon after this Lieutenant Bradley, 7th Infantry, came into our lines, and asked where I was. Greeting most cordially my old friend, I immediately asked, "Where is Custer?" He replied, "I don't know, but I suppose he was killed, as we counted 197 dead bodies. I don't suppose any escaped." We were simply dumfounded. This was the first intimation we had of his fate. It was hard to realize; it did seem impossible.

General Terry and staff, and officers of General Gibbon's column soon after approached, and their coming was greeted with prolonged, hearty cheers. The grave countenance of the General awed the men to silence. The officers assembled to meet their guests. There was scarcely a dry eye; hardly a word was spoken, but quivering lips and hearty grasping of hands gave token of thankfulness for the relief and grief for the misfortune.

During the rest of that day we were busy collecting our effects and destroying surplus property. The wounded were cared for and taken to the camp of our new friends of the Montana column. Among the wounded was saddler "Mike" Madden of my troop, whom I promoted to be sergeant, on the field, for gallantry. Madden was very fond of his grog. His long abstinence had given him a famous thirst. It was necessary to amputate his leg, which was done without administering any anesthetic; but after the amputation the surgeon gave him a good, stiff drink of brandy. Madden eagerly gulped it down, and his eyes fairly danced as he smacked his lips and said, "M-eh, doctor, cut off my other leg."

On the morning of the 28th we left our intrenchments to bury the dead of Custer's command. The morning was bright, and from the high bluffs we had a clear view of Custer's battle-field. We saw a large number of objects that looked like white boulders scattered over the field. Glasses were brought into requisition, and it was announced that these objects were the dead bodies. Captain Weir exclaimed, "Oh, how white they look!"

All the bodies, except a few, were stripped of their clothing. According to my recollection nearly all were scalped or mutilated, but there was one notable exception, that of General Custer, whose face and expression were

natural; he had been shot in the temple and in the left side. Many faces had a pained, almost terrified expression. It is said that "Rain-in-the-face," a Sioux warrior, has gloried that he had cut out and had eaten the heart and liver of one of the officers. Other bodies were mutilated in a disgusting manner. The bodies of Dr. Lord and Lieutenants Porter, Harrington, and Sturgis were not found, at least not recognized. The clothing of Porter and Sturgis was found in the village, and showed that they had been killed. We buried, according to my memoranda, 212 bodies. The killed of the entire command was 265, and of wounded we had 52.

The question has been often asked, "What were the causes of Custer's defeat?" I should say:

First. The overpowering numbers of the enemy and their unexpected cohesion.

Second. Reno's panic rout from the valley.

Third. The defective extraction of the empty cartridge-shells from the carbines.

Of the first, I will say that we had nothing conclusive on which to base calculations of the numbers—and to this day it seems almost incredible that such great numbers of Indians should have left the agencies, to combine against the troops, without information relating thereto having been communicated to the commanders of troops in the field, further than that heretofore mentioned. The second has been mentioned incidentally. The Indians say if Reno's position in the valley had been held, they would have been compelled to divide their strength for the different attacks, which would have caused confusion and apprehension, and prevented the concentration of every able-bodied warrior upon the battalion under Custer; that, at the time of the discovery of Custer's advance to attack, the chiefs gave orders for the village to move, to break up; that, at the time

VIEW, FROM THE SIDE TOWARD THE RIVER, OF CUSTER'S HILL AND THE BATTLE MONUMENT. (FROM A PHOTOGRAPH BY D. F. BARRY.)

of Reno's retreat, this order was being carried out, but as soon as Reno's retreat was assured the order was countermanded, and the squaws were compelled to return with the pony herds; that the order would not have been countermanded had Reno's forces remained fighting in the bottom. Custer's attack did not begin until after Reno had reached the bluffs.

Of the third we can only judge by our own experience. When cartridges were dirty and corroded the ejectors did not always extract the empty shells from the chambers, and the men were compelled to use knives to get them out. When the shells were clean no great difficulty was experienced. To what extent this was a factor in causing the disaster we have no means of knowing.

A battle was unavoidable. Every man in Terry's and Custer's commands expected a battle; it was for that purpose, to punish the Indians, that the command was sent out, and with that determination Custer made his preparations. Had Custer continued his march southward—that is, left the Indian trail—the Indians would have known of our movement on the 25th, and a battle would have been fought very near the same field on which Crook had been attacked and forced back only a week before; the Indians never would have remained in camp and allowed a concentration of the several columns to attack them. If they had escaped without punishment or battle Custer would undoubtedly have been blamed.

COMMENTS BY GENERAL FRY ON THE CUSTER BATTLE.

CAPTAIN GODFREY'S article is a valuable contribution to the authentic history of the campaign which culminated in "Custer's Last Battle," June 25, 1876.

The Sioux war of 1876 originated in a request by the Indian Bureau that certain wild and recalcitrant bands of Indians should be compelled to settle down upon their reservations under control of the Indian agent. Sitting Bull, on the Little Missouri in Dakota, and Crazy Horse, on Powder River, Wyoming, were practically the leaders of the hostile Indians who roamed over what General Sheridan called "an almost totally unknown region, comprising an area of almost 90,000 square miles." The hostile camps contained eight or ten separate bands, each having a chief of its own.

Authority was exercised by a council of chiefs. No chief was endowed with supreme authority, but Sitting Bull was accepted as the leader of all his bands. From 500 to 800 warriors was the most the military authorities thought the hostiles could muster. Sitting Bull's camp, as Custer found it, contained some 8000 or 10,000 men, women, and children, and about 2500 warriors, including boys, who were armed with bows and arrows. The men had good firearms, many of them Winchester rifles, with a large supply of ammunition.

War upon this savage force was authorized by the War Department, and was conducted under the direction of Lieutenant-General Sheridan in Chicago.

The campaign opened in the winter, General Sheridan thinking that was the season in which the Indians could be "caught." He directed General Terry to send a mounted column under Custer against Sitting Bull, and General Crook to move against Crazy Horse. Bad weather prevented Custer's movement, but Crook advanced March 1. On March 17 he struck Crazy Horse's band, was partially defeated, and the weather being very severe, returned to his base. The repulse of Crook's column, and the inability of Custer to move, gave the Indians confidence, and warriors by the hundred slipped away from the agencies and joined the Hostiles.

In the spring Sheridan's forces resumed the offensive in three isolated columns. The first column under Crook, consisting of 15 companies of cavalry and 5 companies of infantry (total 1049), marched northward from Fort Fetterman May 29. The second column under General Terry, consisting of the entire 7th Cavalry, 12 companies (about 600 men), 6 companies of infantry, 3 of them on the supply steamboat (400 men), a battery of Gatling guns manned by infantrymen, and 40 Indian scouts, moved westward from Fort A. Lincoln, on the Missouri, May 17.

It happened that while the expedition was being fitted out, Custer unwittingly incurred the displeasure of President Grant, who directed that Custer should not accompany the column. Through his appeal to the President and the intercession of Terry and Sheridan, Custer was permitted to go in command of his regiment, but Terry was required to accompany and command the column. Terry was one of the best of men and ablest of soldiers, but had no experience in Indian warfare.

A third column under General Gibbon (Colonel of

Infantry), consisting of 4 companies of cavalry and 6 companies of infantry (450 men all told), marched eastward in April, and united with Terry on the Yellowstone, June 21. When these columns started they were all some 200 or 300 miles from the central position occupied by the enemy. Gibbon was under Terry's control, but Crook and Terry were independent of each other.

The authorities believed that either one of the three columns could defeat the enemy if it "caught" him; otherwise isolated forces would not have been sent to "operate blindly," without means of mutual support, against an enemy in the interior of an almost totally unknown region. Indeed General Sherman said in his official report of 1876, "Up to the moment of Custer's defeat there was nothing, official or private, to justify an officer to expect that any detachment would encounter more than 500 or 800 warriors." The appearance of 2500 to 3000 in the Custer fight, General Sherman adds, "amounted to a demonstration that the troops were dealing, not only with the hostiles estimated at from 500 to 800, but with the available part of the Agency Indians, who had gone out to help their friends in a fight."

The utter failure of our campaign was due to underestimating the numbers and prowess of the enemy. The strength he was found to possess proved, as General Sherman said in his report, "that the campaign had been planned on wrong premises." Upon this point Gibbon said, "When these various bands succeeded in finding a leader who possessed tact, courage, and ability to concentrate and keep together so large a force, it was only a question of time when one or the other of the exterior columns would meet with a check from the overwhelming numbers of the interior body."

The first result was that Crook's column encountered the enemy, June 17, and was so badly defeated that it was practically out of the campaign.

In his official report Sheridan claims for Crook a "barren victory," but adds, "Next day he returned to his supply camp on Goose Creek and awaited reinforcements and supplies, considering himself too weak to make any movement until additional troops reached him."

On the 21st of June, Terry, with the column from the east, about one thousand men, was on the south bank of the Yellowstone, at the mouth of the Rosebud. Gibbon was with Terry, and his column from the west, four hundred and fifty men, was some fifteen miles up the Yellowstone on its north bank, nearly opposite the mouth of the Big Horn. The Rosebud and Big Horn flow from south to north about fifteen miles apart, with a high, broken "divide" or ridge between them.

A scouting party had found indications that the Indians were on the Big Horn or its tributaries, and they were found on the 25th about ninety miles away in the valley of the Little Big Horn, with some 2500 warriors. At that time Terry did not imagine them to be so strong, nor did he know that Crook had been defeated on the 17th. He heard nothing of Crook until July 4.

On the night of June 21, Terry held a conference with Gibbon and Custer, at which he says in his annual report in 1876, he decided upon a plan of operations, by which Gibbon was to move south up the Big Horn

valley, Custer was to proceed up the Rosebud and ascertain the direction of the Indian trail, and

if it led to the Little Big Horn it should not be followed, but that Custer should keep still further to the south before turning to the river, in order to intercept the Indians should they attempt to pass around his left, and in order, by a longer march, to give time for Gibbon's column to come up. . . . This plan was founded on the belief that the two columns might be brought into coöperating distance of each other, so either of them which should be first engaged might, by a "waiting fight," give time for the other to come up.

Custer's disaster has been directly or by implication attributed to a departure from the "plan." No record of the conference appears to have been made at the time, but Terry's statement concerning it is supported by Gibbon, and no one would dispute it if it stood alone. But it is highly probable that the plan when Custer moved had neither the force nor importance which it subsequently acquired in Terry's mind. Terry made to Sheridan a full and explicit report, June 27, when the subject was fresh, in which he spoke of the conference, but did not say or intimate that a plan of operations had been decided upon in it. He did say, however, "I informed General Custer I would take the supply steamer up the Yellowstone to ferry General Gibbon's column over the river, that I should personally accompany that column, and that it would in all probability reach the mouth of the Big Horn on the 26th instant." If at that time Terry thought the plan of operations mandatory, he probably would have mentioned it in this report of June 27. It was, however, not until July 2 that he reported the existence of a plan. Then he said in his report to Sheridan made in his own defense, "*I think I owe it to myself to put you more fully in possession of the facts of the late operations,*" and followed with the account of the plan, above quoted from his annual report, but did not say that he had issued any orders which Custer had disobeyed.

The plan decided upon in conference on the night of June 21 fixes no blame on Custer. His written instructions from Terry were made June 22, the day after the conference, and they were binding upon him. They made no reference to a plan, but said:

The Brigadier-General Commanding directs that, as soon as your regiment can be made ready for the march, you will proceed up the Rosebud in pursuit of the Indians whose trail was discovered by Major Reno a few days since. *It is, of course, impossible to give you any definite instructions in regard to this movement, and were it not impossible to do so the department commander places too much confidence in your zeal, energy and ability to wish to impose upon you precise orders which might hamper your action when nearly in contact with the enemy. He will, however, indicate to you his own views of what your action should be, and he desires that you should conform to them unless you shall see sufficient reason for departing from them.*

The order Custer received was to proceed up the Rosebud in pursuit of the Indians. Surely he did not disobey that. Everything else was left to his discretion. As Terry did not wish to hamper Custer's action when nearly in contact with the enemy, and found it impossible to give him precise orders, plainly Custer did not, could not, disobey orders in any blamable sense, and plainly, also, he was expected to come "in contact with the enemy."

Captain Godfrey says that the scouts were sent out on the right flank during the 23d and 24th, moving along the divide between Rosebud and Tulloch's Fork, from which the valley of the Fork was in view. It is true Custer

does not appear to have examined the upper part of Tulloch's Creek, but there were no Indians there, and the omission if it occurred is colorless. He was directed to endeavor to send a scout through to General Gibbon's column with the result of his examination of Tulloch's Creek, and was informed that Gibbon would examine the lower part of the creek. Whether he endeavored to send a messenger cannot be ascertained (Captain Godfrey says that a scout named Herendeen had been selected for this service, and he is of the opinion that General Custer would have sent him during the day if the fight had been delayed until early next morning as he at first intended); but nothing concerning Tulloch's Creek was material in the campaign.

Even conformity to Terry's "views" was expressly left to Custer's discretion.

In his sermon at General Terry's funeral, December 29, 1890, the Rev. Dr. T. T. Munger said:

Custer's fatal movement was in direct violation of both verbal and written orders. When his rashness and disobedience ended in the total destruction of his command, General Terry withheld the fact of the disobeyed orders and suffered an imputation hurtful to his military reputation to rest upon himself, rather than subject a brave but indiscreet subordinate to a charge of disobedience.

When called to account for the accusation which he made against one dead soldier at the Christian burial of another, Dr. Munger gave Colonel R. P. Hughes of the army, a brother-in-law of General Terry and for a long time his aide-de-camp, as authority for his defamatory assertion.

Colonel Hughes denies having authorized Dr. Munger to make the statement, though he admits he was the source of Dr. Munger's information. Called upon more than once, he fails to produce or specify any orders disobeyed by Custer. Indeed there can be no such orders. It is not credible that Terry issued orders which have never been produced by him or any one else, and that these phantom orders if obeyed would have prevented the Custer massacre. Terry was a strict and careful soldier. It was his duty to file with higher authority all the orders he issued in the case, and his orders have passed in due course to their places in the public records, and have been discussed above. Custer disobeyed none of them.

Returning to the conference plan of operations, it must be noted that, like the general plan of campaign, it was based upon a misconception of the enemy's strength. It required that a well-armed, wary, and vigilant enemy of unknown strength, some ninety miles away in a country well known to him but unknown to us, should be approached by two columns, the enemy, as it turned out, exceeding in numbers the two columns combined. Even if Custer had gone quite to the south and had not attacked, the plan put it in the power of the enemy to defeat at least one of the columns as he had defeated Crook. Custer no doubt thought if he was strong enough to go to the south and wait to be attacked, he was strong enough to make the attack, and Terry's instructions left the matter to his judgment.

Terry stated in his report that he believed his plan might have resulted in a "waiting fight" through which the column first engaging the enemy might hold him until the other came up, the implication being that advantage from a "waiting fight" was lost through Custer's action. The truth is that a "waiting fight" is exactly what was secured, but there was no advantage

in it. Custer's command, south of the enemy, kept him engaged from the 25th until the evening of the 26th, when the column from the north approached. Then the Indians quietly slipped away without the northern column being able to detain or injure them.

Godfrey gives the details of Custer's three days' march and of the fight on the 25th and 26th. When the command was nearly in contact with the enemy Custer directed one company to guard the pack-train, sent three companies under Benteen to the south, no doubt in deference to Terry's advice to see that the Indians did not pass that way, ordered Reno with three companies to charge northward down the valley upon the enemy's flank, and with the rest of his force, some 250 men, galloped down the river about three miles to attack in front. The result is known. It is not bad tactics to throw a part of the attacking force upon the exposed flank of the enemy, and support it by a front attack with the other part, and that is what Custer did. To "support" the flanking force is not necessarily to follow it. Custer's "pursuit" to the field where he "caught" the Indians was rapid, but his defeat is not to be attributed to fatigue of horses or men. The offensive is often more fatiguing than the defensive, but the loss of a battle is seldom, if ever, due to the fatigue of the attacking force.

During the Indian outbreak at Pine Ridge Agency, 1890, a battalion of the 9th Cavalry, under Colonel Henry, accompanied by a section of Light Battery E, 1st Artillery, marched as follows: December 24, between 2.30 P.M. and 3.30 next morning fifty miles and six miles further after daylight; scouted actively on the 25th, 26th, and 27th, made forty-four miles on the 28th, and starting at 9.30 A.M. on the 29th made ninety-six miles before 4 P.M. on the 30th; was all the time ready for battle, had a skirmish, and marched six miles after the skirmish, making 102 miles in thirty hours.¹

The part taken by the companies under Reno proved that Custer's force was not too tired to go into the fight and maintain it until the evening of the 26th. The command was probably no more fatigued than cavalry usually is when it attacks in a vigorous pursuit.

Having marched leisurely from Fort Lincoln on the Missouri to the Rosebud on the Yellowstone, the men and horses were well seasoned but not worn, and Reno has stated that when the regiment moved out on the 22d of June "the men and officers were cheerful," the "horses were in best condition." After Custer "caught" the Indians, their "escape," against which he was warned in Terry's written instructions, could be prevented only by attack. The trouble was their strength was underestimated. Terry reported July 2: "He [Custer] expressed the utmost confidence he had all the force he could need, and I shared his confidence." Believing, as he and Sheridan and Terry did, that he was strong enough for victory, if Custer had not attacked, and the Indians had moved away, as they did when Gibbon's column approached on the 26th, Cus-

ter would have been condemned, perhaps disgraced. With his six hundred troopers he could not herd the Indians, nor, in that vast, wild, and difficult region, with which they were familiar and of which we were ignorant, could he by going further to his left, "south," drive them against Gibbon's column. His fight was forced by the situation. Believing, as Custer and his superiors did, that his 600 troopers were opposed by only 500, or at most 800 warriors, his attack shows neither desperation nor rashness. General Sherman said that when Custer found himself in presence of the Indians he could do nothing but attack.²

In relation to Reno's part, it is proper to state that General Sherman, in his official report, 1876, commends "the brave and prudent conduct of Major Reno," and in 1879 a Court of Inquiry was convened at Reno's request to examine into his conduct in the battle. The court was created by the President and he approved its findings. It reported the facts as it found them, and said "the conduct of the officers throughout was excellent, and while subordinates in some instances did more for the safety of the command by brilliant displays of courage than did Major Reno, there was nothing in his conduct which requires animadversion from this court." Conceding to Reno the right to the benefit of these indorsements, there are some facts which should be noted.

"About the same time that Reno's command was crossing the river in retreat" after it had been engaged only "half an hour or forty-five minutes in all," says the Reno Court of Inquiry, Benteen approached.

His three companies doubled Reno's force, giving him six companies, whereas Custer had only five. Another company with the pack-train arrived a little later. Custer's need of men and ammunition was shown by his last order which Benteen received before joining Reno. "Come on. Big village. Be quick. Bring pack." Under the circumstances Reno might well have treated this order as applying to him as well as to Benteen. As soon as the Indians had driven him back they concentrated upon Custer.

"During a long time" after Benteen joined Reno, says Godfrey, Custer's firing was heard, showing that his five companies were hotly engaged with the opposing force, which Reno had found too strong. If Reno had marched then with his six companies to the sound of Custer's carbines, it would have been conduct to commend, and might have enabled Custer to extricate the command. When he did move out it was too late; Custer's men had been killed, and the enemy was able to oppose Reno with his whole force and drive him back and invest him in his place of refuge.

Crook's and Terry's columns having been defeated, they were heavily reinforced; and on the 30th of July a staff officer from Chicago arrived at Terry's camp with orders for Terry and Crook to unite. After their junction—August 10—there was much marching, but no fighting. The enemy could not be "caught."

James B. Fry.

¹ Lieutenant A. W. Perry, in the Journal of U. S. Cavalry Association.

² NEW YORK CITY, May 11, 1891. DEAR FRY: In reply to your note I cannot recall the whole conversation between General Sherman and myself. I remember distinctly that I was much distressed and greatly excited. The conversation took place not long after Custer's defeat. I condemned everything and everybody, and doubt not I spoke only words of passion without judg-

ment. I think I said that Custer's command was in no condition to fight when he made the attack. To this, or something like it, Sherman said when Custer found himself in the presence of the Indians, he could do nothing but attack.

Very truly, etc., T. L. CRITTENDEN.

The only son of the gallant Union general who wrote the above note fell upon the field with Custer.

GOUNOD IN ITALY AND GERMANY.

REMINISCENCES OF A PENSIONNAIRE OF THE ACADEMY OF FRANCE.

BY CHARLES FRANÇOIS GOUNOD.

IN 1839 I won the Grand Prix for musical composition at the Institute of France. As a consequence, it was my privilege to occupy chambers for the ensuing two years in the palace of the Villa Medici at Rome. I was at that time twenty-one years of age. Fate gave me as fellow-prizemen in other departments the painter Hébert, the architect Lefuel, the sculptor Gruyère, and the medalist engraver Vauthier. At eight o'clock in the evening of the 5th of December, Lefuel, Vauthier, and I entered the mail-coach in the court of the old Paris Hôtel-des-Postes, in the Rue Jean-Jacques Rousseau. Our first stopping-place was Lyons; thence we descended the Rhone via Avignon and Arles to Marseilles. At this point we took a vettura, which was to convey us to the end of our journey.

What memories that word "vettura" suggests to my mind! Poor old, broken-down trap, now crowded out of existence by the puffing of the steam-engine and the giddy dash of iron wheels! How it allowed you to stop, admire, and gaze at your ease on all those views through which or under which the screaming locomotive now transports you as a mere piece of luggage, projecting you through space with all the fury of a mortar-shell! The vettura bore you along tenderly, step by step, as it were, from one charming landscape to another; while this mortar-shell on rails picks you up fast asleep under the gray sky of Paris, and shoots you forth, waking, into the atmosphere of the Orient, without mental transition or change of temperature; roughly, like a bale of merchandise, or an invoice of fish sent by express, with the idea only that it should get to market fresh.

If Progress, that pitiless conqueror, would at least spare the life of the vanquished! But no, the vettura is no more! I bless it for having existed, for it allowed me to enjoy in every detail that admirable Corniche Road, which prepares the traveler so thoroughly for the climate and picturesque beauties of Italy, by unfolding to his gaze a series of enchanting sights—Monaco, Mentone, Sestri, Genoa, Spezia, leading up to Pisa, Lucca, Siena, Perugia, and Flor-

ence—that progressive and ever-varying exposition of nature which explains the masters, masters who themselves in turn show you how to study nature. For nearly two months we were tasting and enjoying all this at our ease, and on the 27th of January, 1840, we made our entry into Rome, which was to become our residence, our school, and the scene of our initiation into the grand and stern beauties of nature and of art.

M. Ingres, whom my father had known when he was young, was at that time the director of the French Conservatory at Rome. On entering his salon, we found that he had been informed of our arrival, and was there to give us a cordial welcome. As soon as he saw me, he exclaimed: "You are Gounod, I am sure! How very like your father!" and he talked of my father, of his talent as a draftsman, his character, the charm of his wit and conversation, in terms that made me proud, coming from the lips of an artist of his high repute, and that furnished the most genial welcome to a new-comer. We were installed at once in our chambers, and at dinner-time were made acquainted with all our colleagues gathered at the common board in that famous hall, which was hung with portraits of all the pensionnaires that had preceded us since the foundation of the Academy.

I must confess that Rome did not at first correspond to the dreams my fancy had conceived. I was still too young in years, and especially in character, to lay hold of and to take in at first glance the deep signification of that great and austere city, which struck me as cold, dry, cheerless, and gloomy, and which speaks with a voice so low that it can be heard only by ears trained to silence and solemn contemplation. Rome is itself so many things, and those things are wrapped in such profound calm, in such quiet and serene majesty, that it is impossible at once even to suspect its marvelous whole, and the inexhaustible store of its many-sided wealth. Its past like its present, its present like its future destiny make it the capital, not of a country, but of humanity. Any one who has lived there long knows this well; and whatever nation claims our loyalty, or whatever tongue is ours, Rome speaks a language so universal that it is impossible to turn our back upon it with-

out feeling that we are turning away from our native land.

That first impression of austerity threw me into a profound melancholy, and a very slight occasion would have been sufficient to put me back on the road to France and to my mother's fireside. However, little by little, every day contributed its sedative effect. I set to work, and among the musical ideas which marked the début of my existence as a pensionnaire I count two songs that have long remained unknown—the "Vallon" and the "Soir." Both of them were composed on verses by Lamartine, and the dreamy and contemplative accent of the music was in perfect accord with my feelings at the time. I wrote them a few days apart and soon after my arrival at the Villa Medici.

Some six weeks elapsed before my sadness took its flight, and I grew accustomed to the town, which had impressed me like a desert. Its very silence now began to charm me, to be in itself a blessing, and I found peculiar pleasure in visiting the Forum, the ruins on the Palatine, the Colosseum, and all those other remains of greatness and power now gone, over which has been extended for ages the august and peaceful crook of the Shepherd of Nations.

My stay was begun under most favorable auspices. M. Ingres had taken a fancy to me. He was passionately fond of music, of Haydn, Mozart, and Beethoven; Gluck especially, by the nobility and the pathos of his style, seemed to him a Greek, a descendant of Æschylus, Sophocles, and Euripides. M. Ingres played on the violin. He was not a great proficient, still less a virtuoso; but he had in his youth belonged to the orchestra in the theater of Montauban, his native town, where he had taken part in the performance of Gluck's operas. I had read and studied the works of Gluck; as for Mozart's "Don Juan," I knew it by heart, and although I was not a pianist, I made a respectable enough show to be able to please M. Ingres with the remembrance of that score, which he adored. I knew likewise from memory the symphonies of Beethoven, greatly admired by him. We often spent together a portion of the night in this familiar association with the great masters, and in a short time I was wholly secure in his friendship. That was a genuine piece of good fortune for me. I owe more than I could ever express to the contact with such a solid mind, inflexible as he was in his fervent conception of the beautiful, simple and naïf as a child, and so wrongly and narrowly judged by those who did not know him well, although he was so transparent and easy to know. He was persuasive in his faith, because he allowed himself to be carried away by it even to enthusiasm and eloquence; sincerely

humble and small in the presence of masters, but dignified and proud in the presence of self-assertion and the arrogance of fools; paternal to all the pensionnaires, whom he looked on as his children, and whose rank he maintained with jealous affection in the midst of the visitors of whatever category who were admitted to his drawing-rooms. Such was the great and noble artist by whose precious and fruitful instruction I was to have the good fortune to profit.

One must have associated freely with men of superior genius to comprehend how their conversation influences the development of our peculiar capacities by the lessons of their experience and the light shed by their general conclusions. M. Ingres let fall in my presence words, precepts, observations, aphorisms, which have given direction to my whole life. In giving me to understand what art is, he taught me more of my own art than numberless purely technical artists ever could have done; his ideas constantly revealed in him and awoke in his hearer the perception of the conditions and laws of beauty in art. It has been said, and many have mechanically repeated it, that he was exclusive; nothing is more false. I never saw any one admire more things than he, for the very reason that he saw better than any one where and why a thing is worthy of admiration. It is true that he was discreet. He understood how far enthusiasm lures young men to infatuation for certain personal traits of this or that master, without discernment or method; that those peculiarities which are the proper and distinctive characteristic of masters, their individual physiognomy by which they are recognized, as men recognize one another, are precisely the incommunicable properties of their nature; that, as a consequence, to be inclined to imitate them is but little short of plagiarism; and that, furthermore, such imitation tends to a fatal exaggeration of qualities which the imitator fashions into so many defects. That is M. Ingres's view, and the origin of the most unreasonable accusation against him on the score of exclusiveness and intolerance.

To show how sincere he was in modifying a first and superficial impression of prejudice, the following anecdote will suffice. I had just sung for him, for the first time, that admirable scene of *Charon* and the *Shades* in the "Alcestis," not by Gluck, but by Lulli. The first performance had produced in him an impression of stiffness, harshness, and uncouth roughness so painful that he exclaimed: "That is frightful! That is not music; it is iron." Being but a youth, I took good care not to oppose the impetuosity of a man for whom I entertained so high a regard; I waited for the tempest to pass by. Some time after, M. Ingres recurred to the impression made on him by that piece.

The impression seemed to me somewhat softened now, as he said: "Pray let us hear that scene by Lulli—*Charon* and the *Shades*. I should be glad to hear that again." I sang it anew, and this time, better acquainted, doubtless, with the primitive and rough style of this startling picture, he was struck with the irony and satire of *Charon's* language, and the power expressed by the lamentation of the wandering *Shades*, rejected from the Stygian bark because they were unprovided with the passage-money. Gradually he became so attached to the character of the scene that it came to be one of his favorite pieces, and he was constantly requesting me to repeat it. But his prevailing passion was Mozart's "*Don Juan*," over which we lingered occasionally till two o'clock in the morning, when Madame Ingres, tired out from loss of sleep, would feel obliged to close the piano to separate us, and pack us off to our respective beds.

My stay at Rome, which was my permanent and regular residence, was supplemented by authorized excursions to other parts of Italy. I shall never forget the impression produced on me by Naples at my first visit. The charming climate, which anticipates and suggests the sky of Greece; that bay, blue as sapphire, set in a circle of mountains and islands, whose slopes and peaks assume at sunset the ever-changing scale of magic hues which would defy the richest velvet or the most brilliant gems—all this produced the effect of a dream or a fairy tale. The environment of this wonderful scene—Vesuvius, Portici, Herculaneum, Pompeii, Castel-a-Mare, Sorrento, the islands of Capri and Ischia, Posilippo, and, farther off, Amalfi, Salerno, and, last of all, Pæstum, with its marvellous Doric temples bathed aforetime by the azure waves of the Mediterranean—all this seemed to me a vision indeed. It was the absolute reverse of Rome; I was at once in ecstasy. If to such seduction be added all the interest that attaches to a visit to the Museum of Naples, a unique storehouse of masterpieces of antique art, the greater part of which have been brought to light by the excavations of Pompeii and Herculaneum, the attractions that such a city must afford, and especially the pleasures that await the artist in such an environment as this, will be easily understood.

During my residence in Rome I had the good fortune to visit Naples on three distinct occasions, and among the most vivid and profound impressions which I bore away with me I give the first place to that wondrous island of Capri, all the more wild and charming by the contrast of its steep crags and its green slopes. I first visited Capri in summer; the sun shone brightly, diffusing a torrid warmth. During the day one was forced to shut himself

up in a room or to plunge into the sea—an alternative which I often chose with delight. But what is difficult to portray is the glory of the nights in such a climate, and at such a season of the year. The heavens seemed literally palpitating with stars—a counterpart, as it were, of the sea, with waves of light vibrating along the infinite vault above. During the fortnight of my stay I often listened to the living silence of those phosphorescent evenings. I sat for hours on the top of some steep crag, scanning the horizon, occasionally watching large stones that I would start rolling down the almost perpendicular mountain, enjoying their crashing bounds to the sea, into which they would disappear with a cloud of spray and foam. From time to time a solitary bird passed over, uttering a plaintive note, leading my thoughts back to those fancied gulfs whose impression of terror has been so marvelously rendered by the genius of Weber in his immortal scene of "*The Casting of the Bullets*" in the opera of "*Der Freyschütz*."

It was on one of those nocturnal excursions that I had the first conception of the *Walpurgisnacht* in Goethe's "*Faust*." I had read that work at the age of twenty, and it never had left my mind. I bore it with me everywhere I went, and jotted down in scattered notes the different ideas which I imagined might serve me when the time should come to try this subject as an opera—an event not realized till seventeen years later.

But at length I was obliged to return to Rome and the Academy. However delightful and seductive a residence at Naples is, I have never lived there without feeling after a certain interval the need of going back to Rome. Something like homesickness now came over me, and without sorrow I withdrew from those scenes where I confess I had spent delicious hours. The fact is that Naples, with all its brilliancy and reputation, must be set down as a loud, vulgar, bustling, high-keyed town. From morning till night crowds push, scuffle, and quarrel on its wharves, where neither rest nor silence is known. Its normal state is one of contention. You are besieged, importuned, and beset on all sides by the untiring sollicitations of porters, traffickers, hackmen, and boatmen, who would take violent possession of you if they could, competing with one another in cutting down their prices and fares.

Once more in Rome, I went to work. It was now the autumn of 1840. At this period it was customary for the musicians of the Conservatory to direct, each year by turn, the performance of a mass with orchestra specially composed for the fête of King Louis Philippe, to be celebrated on the 1st of May in the church of San Luigi de' Francesi. It fell to my lot to

write the mass to be performed in May, 1841. I composed and directed personally the performance of the piece, which gained for me the title for life of Honorary Maître de Chapelle. The more I prolonged my stay in Rome the more deeply I loved its mysterious charm, its incomparable peace. After the serrated, volcanic, and swelling lines of the Neapolitan crater; the placid, solemn, noiseless lines of the Roman Campagna, encircled with the Alban hills, the mountains of Latium and the Sabine district, the majestic Mons Januarius, Soracte, the hills of Viterbo, Monte Mario and the Janiculum, all impressed me with the calm, sweet air of an open cloister. One of my favorite positions in the environs of Rome was the village of Nemi, with its lake visible to the eye at the bottom of a vast crater surrounded with woods in admirable foliage. One of the most beautiful walks imaginable is around the lake by the upper road; a beautiful day, ending with such a sunset as I have witnessed there,—with a glimpse of the sea from the heights of Genzano,—leaves an enchanting and ineffaceable remembrance. Indeed, the environs of Rome abound in wonderful spots, which furnish the traveler and the tourist with an inexhaustible variety of impressions; such as Tivoli, Subiaco, Frascati, Albano, and a thousand other places so often explored by landscape-painters, not to speak of the Tiber, whose banks exhibit such noble and majestic outlines.

Among the wonders of art found only at Rome, it would be impossible in these reminiscences of my youth to pass over that work of indescribable beauty which shares with the Sistine Chapel the interest and glory of the Vatican. I mean those immortal paintings of Raphael grouped under the common designations of the Loggie and the Stanze. Two masterpieces, among so many others, due to the pencil of that unique artist, those inimitable works the "School of Athens" and the "Dispute of the Holy Sacrament," have carried so high the note of beauty that it would seem impossible ever to surpass them. And yet,—such is the irresistible privilege of genius,—that the man who never had his equal, whose name the centuries have placed on the summit of glory, was disturbed at the apparition of Michelangelo! He suffered the grasp of that Titan, he bowed under the crushing weight of that Colossus, and his last works bear traces of the homage he offered to the grandiose inspiration of that powerful genius, which exceeded human proportions. Raphael is the first, Michelangelo the only. In Raphael strength dilates and expands into grace; in Michelangelo grace, on the contrary, seems to discipline and conquer strength. Raphael charms you and allures you; Michelangelo fascinates you and overwhelms

you. The one is the painter of the earthly paradise, the other seems to penetrate with an eagle's eye, like the prisoner of Patmos, into the very flaming dwelling-place of the seraphim and the archangels. One would say that those two evangelists of art had been put there beside each other in the fullness of esthetic time to the end that he who had received the gift of calm and perfect beauty should be a salutary protection against the dazzling splendors revealed to the singer of the Apocalypse.

In the month of April, 1841, M. Ingres left the Academy. His term as director had expired. He was replaced by M. Schnetz, a celebrated painter, who chiefly owed his success and his popularity to qualities of sentiment and expression. Under an easy and almost rustic exterior M. Schnetz veiled a refined and intelligent nature. He was very tall, of a dark, swarthy complexion, with black hair like an Italian's. His smile was very sweet, and his character had a charming gaiety. He was an excellent man. I spent my second and last year at Rome under his direction. M. Schnetz had a special fondness for Rome which was peculiarly favored by circumstances. He was for many years director of the Academy, and left there the very best impressions.

My stay was about to expire with the year 1841; but I felt unable to go away, and I continued there with the consent of the Director until my resources were exhausted and I was obliged to proceed to Germany to discharge the obligations of my third year, in order to draw the salary which I needed for my support. I shall not try to describe my sorrow when I was compelled to say farewell to the Academy, to my beloved companions, and to that Rome which had become a second home to me.

My companions bore me company as far as Ponte Molle (Pons Milvius), and after having embraced them, I got into the vettura which was to tear me away—yes, that is the word—from those dear years of the Promised Land. If I had been going direct to my poor mother and my excellent brother, the departure would have been less painful to me; but I was to live alone in a country where I knew no one, and of the language of which I was ignorant, and this prospect seemed to me cold and dark. As long as the highroad permitted, I kept my eyes fixed on the dome of St. Peter's—that "high place" of Rome, and center of the world; then the hills caught it away wholly from my sight and I surrendered myself, weeping bitterly, to my sad reflections.

ON leaving Rome to proceed to Germany my route naturally led through Florence and the north of Italy, trending to the right by

Ferrara, Padua, Venice, and Trieste. I made a stop at Florence, but I will not undertake to present the inventory of its treasures. Florence, as well as Rome, throwing out of the account all attempt at comparison, is inexhaustible in works of art. The Uffizi, with its admirable Tribune, a true shrine of the beautiful, the Pitti, the Academy, the churches, the convents, are crowded with masterpieces. But there, too, in that delightful city of Florence, the scepter is in the grasp of Michelangelo, who dominates everything from the vantage-ground of that marvelous and striking Chapel of the Medici. There, as at Rome, his genius has left unique, sovereign, incomparable traces. Everybody knows this chapel by the admirable statues it contains, and which have been for years made common by copies or by photography. Whenever Michelangelo is found, he compels meditation. When he speaks, you feel that all must be silence; and that supreme authority of silence he has perhaps exercised nowhere with more power than in the terrible crypt of the Medici Chapel. What a prodigious conception is that of the "Pensiero," mute sentinel who seems to be watching over death and waiting motionless for the trumpet of Judgment! What repose and flexibility in that figure of "Night," or rather of Peace in Sleep, which forms the counterpart of that robust figure of "Day," lying there apparently chained until the dawn of the final Day of Days! By this profound feeling, and by the ideal, and at the same time natural, attitude, Michelangelo everywhere rises to that intensity of expression which is the peculiar mark of his powerful individuality. The amplitude of his style is as the channel wrought by the majestic river of his thought, and for this reason every imitation of his mere exterior is at once condemned as pompous and bombastic; he alone could fill and give life to the form peculiar to his own genius.

But I am on my way to Germany, whither time and money are urging me. I must slip rapidly over Florence and the noble associations that it leaves on my memory; I hasten through the waste of Ferrara; I stop at Padua a day or two to visit the beautiful frescos of Giotto and of Mantegna, and at last reach Venice.

Venice! Ah, that enchantress! She is the country of resplendent masters. Venice has thrown a sunny light over painting. She charms one's senses; and as a consequence her attraction is instantaneous. She intoxicates, but the intoxication that she excites is mingled (at least it has been so in my case) with an inexplicable melancholy, something like the sentiment of captivity. Is it the memory of those dark tragedies of which she has been the theater, and to which her very situation seems to have pre-

destined her? It is perhaps so; although a long stay in that kind of amphibious necropolis does not seem to me possible without at last experiencing something of a smothered feeling, or falling into a state of mental depression. The sleeping waters whose gloomy silence bathes the feet of all the old palaces, that mournful shadow from the depths of which you seem to hear the groans of some illustrious victim, make Venice a kind of capital of Fear; she has preserved a sinister impression. And yet on a fair day what magic in that Grand Canal! How those lagoons flash as the waters seem transformed into life! What brilliancy in those remains of an antique splendor which seem to rival the beauty of their skies and to implore their aid against the gulf into which they are sinking farther and farther every day, to disappear at last forever!

If Rome possesses the Vatican and Florence the Chapel of the Medici, Venice has also her peerless treasure in the Church of St. Mark. Such a marvel cannot be described, it must have been seen to form an idea of it. The magnificence of those mosaics and of that gold whose dark iridescence streams down from the height of the cupola to the base is something absolutely unique in the world. I do not know anything to be compared with it in vigor of tone and power of effect. But I must bid farewell to Venice, and leave Italy at last. Shall I again see it some day? I hope so, God knows.

The steam-packet conveyed me to Trieste, where I at once took my seat in the diligence for Grätz. On the way I visited the curious and superb grottoes of stalactites at Adelberg, genuine subterranean cathedrals. I crossed the mountains of Carinthia, whose serrated outlines I perceived as we rode on. I arrived at Grätz, then went on to Olmütz, whence the railway transported me to Vienna, my first station in that Germany which I only expected to pass through in the greatest haste to shorten the exile which separated me from my mother's home.

Vienna is a stirring town. The people there seem almost more French than German, on account of the vivacity of their character. It is a spirited, easy-going, lively city. I knew nobody at Vienna, but a traveling companion had advised me to take board, if I could, in a private family. The occasion to carry out this advice soon presented itself. I went provisionally to a hotel, and one of the first things I did was to attend the theater, where I heard "The Magic Flute" of Mozart. The orchestra was directed by Otto Nicolai; I got permission to be presented to him. He gave me a very cordial reception, and at once put me into relations with the artists of the theater and the

orchestra. That was the first time that I had ever listened to that adorable score of "The Magic Flute." I was in raptures. The execution was superior, the part of the *Queen of Night* was admirably rendered by a cantatrice of very great talent, Mme. Hasselt-Barth; that of the High Priest, *Sarasstro*, was sung by Staudigl, an artist of great reputation, with an admirable voice, which he controlled with great method and style. The other parts were all rendered with great pains, and I remember still the charming voices of the three lads who took the parts of the three genii.

Thanks to the acquaintance which I had just made with Nicolai, I felt no longer isolated at Vienna, and recovered my good spirits. Nicolai presented me to several artists of the orchestra; among others to a cornetist whose name was Lévy, the father of Richard Lévy, who was then a child of fourteen years, and who since then has held at the Vienna Opera the position of his father. Lévy made me promise to come to see him, and I received a most cordial welcome from the whole family. There were in the house three other children: the eldest, Carl Lévy, was a pianist of a good deal of talent and a distinguished composer; the second, Gustave, is to-day a publisher of music in Vienna; and the daughter, Mélanie, a charming person, is married to the harpist Parish Alwars.

After some weeks of residence I became acquainted with Count Stockhammer, President of the Philharmonic Society of Vienna, who gave me the opportunity of bringing out in the Church of St. Charles the mass that I had directed at Rome the year before on the occasion of the fête of King Louis Philippe. This execution was well received, and Count Stockhammer immediately proposed to me the composition of a requiem mass to be performed on All Souls' Day, in the same Church of St. Charles. Although it was then the 14th of September, and there were only six weeks to the 2d of November, I accepted resolutely, and went to work. I worked day and night, and was ready at the appointed moment. A single rehearsal was sufficient—thanks to the generality of musical education which is found in Germany only, and which is very agreeable to meet. I was especially astonished at the facility with which the boys of the schools read music at sight; they all read it as fluently as if it had been their mother tongue. As a consequence the execution of the choruses was perfect. I had among the soloists a superb basso Draxler by name, who was then quite young and shared with Staudigl the position of first basso at the theater. Since then Staudigl has died insane, they say; and Draxler, who replaced him, was still at the theater twenty-five years afterward, in 1868, when I returned

to Vienna to bring out my opera of "Romeo and Juliet."

Some time before the performance of my requiem, Nicolai had put me in relations with an eminent composer named Becker, who devoted himself exclusively to chamber-concert music. At his house every week a quartet gathered, one of whom, the first violinist, Holz by name, had known Beethoven intimately, a circumstance which, aside from his talent, rendered his acquaintance very interesting. In addition, Becker was perhaps the most popular musical critic at this time in all Germany. He came to hear my requiem, and he made a very favorable report of it, which was encouraging to a young man of my age. He said, among other things, that this work, while it was that of a young artist who was still seeking his path and his style, revealed a breadth of conception that had become very rare in his day. This great labor that I had accomplished in a few weeks had exhausted me to such a degree that I fell ill with a very serious inflammation of the lungs and abscess in the throat. I did not wish to inform my mother of my state, fearing to alarm her, but I acquainted one of my friends in Paris with my situation. This friend, Alexandre Desgoffe, a landscape-painter of noble and severe style, was the pupil and friend of M. Ingres. I had met him on my first arrival in Rome, at the French Conservatory, where with his wife and daughter he occupied an apartment placed at his disposal by M. Ingres. I was not long in finding in this excellent family such cordiality as made me feel at once at home, and a lasting friendship was the result. Desgoffe was a man of rare nature, deep-hearted, devoted in his attachments, simple and transparent as a child, faithful and generous to the last degree. As soon as he learned that I was ill in Vienna, without a moment's hesitation he left his wife and daughter, laid aside the paintings he was preparing for the Salon, and set out to take his place by my side. At that period it required some five or six days to go from Paris to Vienna. It was the month of December, and the journey, naturally disagreeable at that season, was made far more so by a serious illness that attacked my poor friend on the way. As a consequence, he reached Vienna in a situation demanding a doctor's care for himself. Notwithstanding, he spent twenty-two days with me, sleeping on the floor on a mattress, with one eye open, watching with the solicitude of a mother my every motion, and refused to leave me to return to Paris until the physician had assured him of my complete convalescence. Such friendship is not often met with, and in this respect Providence has crowned my life, as I shall often have occasion to acknowledge.

Nevertheless the success of my requiem had modified all my plans, deciding me to prolong my stay at Vienna. Count Stockhammer gave me a new order in the name of the Philharmonic Society. The proposition was to write a vocal mass, without accompaniment, designed to be performed during Lent, in the same Church of St. Charles, my patron saint. I took good care not to let slip this fresh opportunity, first of keeping myself in training, and also of hearing my own pieces rendered—a thing of such rare importance to me at the outset of my career. It was my second and final work at Vienna, whence I set out soon after for Berlin, making but a short stop in Prague and Dresden. I was, however, unwilling to leave Dresden without having visited the admirable museum, in which, among other masterpieces, are found the celebrated “Madonna” by Holbein and the marvelous “Madonna di San Sisto” of Raphael.

On my arrival at Berlin, my first call was on a person I had become acquainted with in Rome. This was Mme. Hensel, sister of the illustrious composer Mendelssohn-Bartholdy, and wife of M. Hensel, at that time painter to the King of Prussia. Mme. Hensel was an extraordinary musician, a remarkable pianist, a woman of superior ability, slender in form, petite in stature, but possessed of an energy which could be seen in her penetrating glance and the flash of her eye. She was, furthermore, endowed with rare faculties as a composer, and to her are due several of the “Songs without Words” which are found published in a work on the piano under her brother’s name. Mme. Hensel had resided in Rome with her husband during the winter of 1841, and often came to the soirées of the Academy, where I frequently had the opportunity and the pleasure of hearing her. She knew by heart the music of the masters, and, thanks to her prodigious memory, it was an advantage as well as a treat to listen to her interpretation of Bach, Haydn, Mozart, Beethoven, and her brother—Mendelssohn.

I therefore lost no time in calling on her, as in fact she had made me promise to do; but some three weeks subsequently I again fell ill, at the very moment I had written my mother that I was preparing to return home, after a separation of three years and a half. Mme. Hensel at once sent me her physician, and to him I addressed the following ultimatum:

“Sir: My mother in Paris is expecting my return, and is at this instant counting the hours. If she knows I am detained by illness, she will start for Berlin, and may go mad on the way. She is advanced in years. I must give her a reason for my delay; but it must be brief. I give you a fortnight to put me into the ground or on my feet again.”

“Well,” said the doctor, “if you are resolved to follow my prescriptions, you will be off in a fortnight.”

And he kept his word; the fourteenth day I was *hors d'affaire*, and forty-eight hours later I found myself on the road to Leipsic, where Mendelssohn resided, to whom I had a letter of introduction from his sister.

Mendelssohn received me admirably. I use this word purposely to characterize the condescension with which a man of his powers welcomed the child who in his eyes could be but a school-boy. During the four days I spent at Leipsic, I may indeed say that Mendelssohn gave me his whole time. He questioned me about my studies and my works with the deepest and most sincere interest. He expressed a desire to hear on the piano my latest effort, and I received from him precious words of approval and encouragement. I shall mention but one, which has made me too proud ever to forget it. I had just rendered the “Dies Iræ” of my Vienna requiem. He placed his hand on a part consisting of five solo voices, without accompaniment, saying, “*Mon ami*, that might be signed Cherubini!” Such words are genuine decorations, coming from such a master, and are worn with greater pride than many a ribbon.

Mendelssohn was the director of the Gewandhaus. The orchestra did not meet at that time, the concert season having expired. He had the thoughtfulness to call it together for me, and allowed me to hear his beautiful Scotch symphony in A minor. He made me a present of the score, with a friendly word of dedication written with his own hand. Alas! the untimely death of that noble genius was soon to transform the souvenir he had left me into a precious relic. His death was followed, six months later, by that of the charming sister to whom I owed the honor of this acquaintance.

Mendelssohn did not limit his polite attentions to that convocation of the Gewandhaus orchestra. He was an organist of the first order, and wished to make me acquainted with several of the admirable compositions written by the great Sebastian Bach for the instrument over which he reigned supreme. To this end he had examined and put in order the old St. Thomas organ, on which Bach himself had played, and for more than two hours he revealed marvels of which I had never dreamed; then, to crown all, he presented me with a collection of motets by Bach, for whom he felt a religious veneration, in whose school he had been educated from childhood, and whose grand oratorio of “The Passion according to St. Matthew” he had directed and accompanied, from memory, at the age of fourteen!

Such was the extraordinary kindness I received from this delightful man, this great artist, this astonishing musician, taken away in the flower of his life—at thirty-eight—from the center of admiration which he had won, and from the masterpieces which he would have written had his life been prolonged. But strange destiny of genius—even the most attractive! These exquisite works, now the delight of those who attend the Conservatory, required the death of the composer to give them favor in the ears of those who once rejected them.

After my visit to Mendelssohn, I had but one thought, and that was to get back to Paris as soon as possible. I left Leipsic the 18th of May, 1843. I changed carriages seventeen times on the way, and out of six nights I spent four traveling, and finally, on May 25, I reached Paris, where a new life was about to open to me. My brother met me on the arrival of the diligence, and we both bent our footsteps at once in the direction of that dear house where I was to find again, and to which I was to bring back, so much joy.

Charles François Gounod.

THE JEWISH QUESTION.

TO approach the Jewish question is to be confronted with every great question of the day—social, political, financial, humanitarian, national, and religious. Each phase should be treated by an expert and specialist, for in each lies a deep, urgent, practical problem which requires the wisest and most skilled handling; but however discussed or dealt with, there is one point of view which should never be lost sight of—namely, the point of view of humanity. All other standpoints must be merged or held in abeyance. First and foremost we must be human if we would raise our voice on so human a theme, involving the lives and destinies of so many unhappy human beings. It is a sorry spectacle that the world presents at the end of our emancipated nineteenth century—hundreds and thousands of our fellow creatures, men, women, and innocent children, driven from their homes, helpless, destitute, and distracted, flying where? whither? No one knows, for in turn each nation threatens to shut them out as outcasts and pariahs. Who, then, are these alien wretches, with speech unlike our own, with ways and customs peculiar to themselves, and what is their crime? we ask. There are those who will tell us that they are usurers, eating the flesh and grinding the faces of the poor; others will say that they are traitors, plotting against their sovereign rulers; others will call them enemies of the Christ; and again others will lay at their door nameless cruel charges of ignorant fanaticism. Their crime is legion, and yet one word sums it up—they are Jews. "Hep! Hep!" It is an old battle-cry, old as Christendom,

but it rings to-day fresh from the nations. Russia leads with brute violence, sweeping them from the soil; Germany follows with lofty phrases, pulpit and paper warfare; even liberal France takes the alarm, and occasionally a small British voice pipes in the chorus: "Christians, beware! The Jew is richer, is sharper, than you. Look to your interest and your purse. Royalty is at his feet, the stock exchange belongs to him, and the press is his organ."

But in justice to humanity let us hasten to add that there is another side. In all the countries we have named, Russia perhaps alone excepted, all earnest and right-minded Christians, no less than Jews, are aghast at the sinister revelations, and are doing what they can to stem the current and to enter their protest against so barbarous a reaction. But this new outbreak of hatred and antagonism, after centuries of progress and enlightenment, is a phenomenon so startling that it calls for examination more searching, and deeper comprehension, than it generally receives. Whether the tragic history of the Jews redounds more to their glory and martyrdom than to the honor of the Christians is not the point which will throw any special light upon the subject just now, but both Jews and Christians alike—whoever studies with impartiality the annals of the past—must be struck with the ever-recurring features, the mask, of this ugly monster of persecution, grown so familiar through the ages. History seems to move backward or in a circle; here are the same grievances as in the days of the Cæsars, the same jealous mistrust and animosity, the same cruel and exaggerated retribution. The classic writers of pagan antiquity are full of the most scornful and contemptuous references. A fair-minded writer of to-day¹ says of the Jew:

¹ Harold Frederic, in the "Times" of October 12.

Even his virtues are of the unsympathetic sort. Temperate, uniformly chaste and industrious, a faithful husband and marvelously good father, a peaceful and law-abiding citizen in whatever country he may be, yet no one wants him as a settler; and the miseries of the Russian Jew had to mount up in the scale until they suggested the horrors of the Spanish Inquisition before the world really took much interest.

To seek for the origin and explanation of so radical an incompatibility would be well-nigh a hopeless task; but much more useful and important would be to draw what lesson we could for the future which would help toward the solution, however distant, of so complicated and grievous a problem. Of all the schemes of colonization the one that appeals most to the imagination is the return to Palestine. On the spot where they once were a great nation, and amid surroundings that seem better suited to their traditions and highest destiny than our Western conditions, they might again put forth some great spiritual idea—some new blossoming of the genius which is surely theirs. But the object of the present study is not to offer any suggestion or panacea, but rather, if possible, to lift the subject upon a broader plane, to rise for the moment above the human drama of strife and suffering which is being enacted, into the region of pure ideas and principles,—for it is here that the warfare of Israel is truly accomplished,—and to discover, if we may, the spiritual facts and forces that are at play, the ultimate result to which they point, and the working of divine and eternal truth through so much human error and sacrifice.

And in endeavoring to do this it is to the Jews rather than to the Christians that we would address ourselves—to the advanced and liberated Jews of Europe and America; for it is with them that a great responsibility rests and a great opportunity. Thoroughly aroused to the material exigencies of the situation, collectively and individually giving their best energies, spending their money like water, the reproach can never be brought against the Jew that he has failed to respond to the cry of his brother in distress, or that prosperity has made him forget the endless adversity of his race. But in providing a home for his hapless comrade, in crowding him into the overcrowded ranks of the toiling masses, and initiating him into the fierce struggle of modern selfishness, has he done all his duty? Or even in holding out the hand of religious fellowship, and helping him to the full and free exercise of the immemorial customs and traditions of his race, is the free, untrammelled Israelite doing the best and the highest that his advantages and opportunities can suggest for this belated newcomer, who emerges, as it were, out of the

middle ages into the bright light of a new day, and the broad rushing stream of Western ideas? And in order to answer these questions we must endeavor, if possible, clearly to understand the true status of the Jew in modern civilization: the moral and material conditions under which he is allowed to advance; the ideals and aims which he sets for himself—in other words, the true import and content of modern Judaism under its most favorable circumstances and environment. Broadly speaking, we come upon three classes of Jews in the community, sometimes sharply defined and again merging into one another. First, there is the remnant of orthodox Jews, mostly of Spanish and Portuguese descent, but with greatly enlarged contingent now of Russian and Polish immigration, who cling without shadow of turning to the primeval faith, strictly observing the rigid form of the Sabbath, the whole dietary régime, every text of the law, every feast and every fast that commemorates a religious or a national event. If we go into the most modern of their synagogues we shall find it exactly as in the ancient days, the entrance always facing the east; the reader's desk in the middle, with its tall candlesticks; the perpetual lamp burning before the tabernacle where the scrolls of the law are contained, wrapped in their silken mantles and overtopped with their silvery tinkling bells; the men and women seated apart, the women in their upper gallery, the men with covered head, and over their shoulders the white and blue-bordered silken scarfs, with fringes knotted according to custom to represent the Hebrew characters of the law; the service entirely in Hebrew, chanted by the reader with response by the congregation, and occasionally a chorus of male voices. No need to question these venerable believers. Their faith is as old as Moses, and their code, the one he formulated four thousand years ago, elaborated into a system more complete than anything that has ever been devised, a subtle interweaving of precept and practice so that every action of the life is regulated according to some Levitical command, and every command is externalized into some outward fact and observance. In the eyes of such conformists Judaism is a sacred trust, at once national, religious, and ancestral, to be handed down intact from generation to generation, and the Jews are a special, consecrated race, favored and chosen of God to be the bearers of this Word unto men.

Breaking away from this extreme formalism, with its excessive and difficult minutiae, we find the second class—the reform Jews, who constitute an always increasing body, being constantly recruited from the orthodox ranks. Still following the traditions observing

the seventh day as the Sabbath, the solemn fast, and all the great holidays, they have generally emancipated themselves from much of the ceremonial law, especially the dietary restrictions, and the whole code and practice of life have more scope and freedom. In the synagogue—or temple, as they prefer to call it—the service is still for the most part in Hebrew; but there is an organ and a choir, and men and women sit together, the men with uncovered heads. Here again the principles are not difficult to define, although somewhat less stable and consistent, and opening the way to the third class, which reveals elements more complex and anomalous, and horizons infinitely larger but more vague. And in regard to this third class we cannot do better than freely quote from the pages of the "*Revue des Deux Mondes*"¹ by Leroy Beaulieu, whose masterly and comprehensive survey of the whole subject has nowhere been equaled. Rejecting, he says, as effete and outworn, the legal and ritualistic tradition, the Jews of this class fasten upon the race tradition, the Messianic hope, and belief in the destiny of Israel again to give a religion to the world, "but this time a religion without inconvenient customs, or unreasonable dogma, without miracles or any mysteries." In this case, however, so radical and complete is the separation from their orthodox coreligionists that the very corner-stone of the one becomes the stumbling-block in the eyes of the others, the obstacle which in all ages has prevented Judaism from arriving at its legitimate and universal supremacy. "Break your chains," say these disciples of progress. "Proclaim the Unity of God, the sanctity of the moral law, and you have a faith at once human and divine, both large and simple enough to satisfy all mankind." A beautiful dream, says Leroy Beaulieu, and entirely characteristic of the race. But will it truly satisfy any one, above all their brethren the Jews themselves, who look upon their very existence as conditioned upon precisely the things they are asked to give up? Without rites, without dogma and formal cult, can they have a religion at all? he asks; can they have Judaism, at all events? What remains when all outward form and semblance has departed from that which was built and buttressed upon outward form? What substance, what essence, is left of the Judaic idea, save an abstract and far-away deism, or a humanitarianism more delusive still, leading down the banal sliding-scale of unbelief?

Such a question is fully justified when we see foremost among the ranks of agnosticism, skepticism, and materialism so large a preponderance of Jews that this too is brought in reproach against them. For there is no more noteworthy

¹ For February 15, May 1, and July 15.

and singular fact in the whole history of this singular people than the constant and uniform recurrence of the two opposite types—the extremes of idealism and materialism which the race presents. While their whole existence and survival are based upon a spiritual idea, there is no people whose kingdom is so absolutely of this world, and who are so prone, so apt, so eager, to take advantage of all its opportunities.

In the face of all these contradictions, where then shall we find the rallying-point, where the real unity, the central sun which shall illumine not Judaism alone, but all mankind? Not for an instant do we doubt that each of the sects we have described has vitality enough to survive for long years to come; but it can survive only as a sect, with all the limitations and disabilities that the name involves. And the world is breaking free from these narrow lines. Everywhere there are signs of a spiritual awakening and expansion which every religion must meet and fulfil or be found wanting. Even science leads now to the portals of "The Unknown God." Christianity is undergoing a profound modification, and a divine spark still lingers in Judaism.

But in order to kindle this into a flame a deeper current is needed, a more glowing impulse, and that quickening breath of the spirit which does not seem to animate modern Jewish life and thought. It is not enough to rehearse the glories of the past, nor to point to names, distinguished though they be in the world of to-day. The need of Israel in the present and its true greatness in the past consist in spiritual leadership. Above the inert mass, the dull crowd of Pharisees and Scribes dwelling within the lifeless body of the law, have arisen the divinely gifted men, the prophets and seers of the world, who saw God and spoke face to face with him. From Abraham to St. Paul they were men who threw off the idolatries and superstitions of the times, the bondage of the letter, and proclaimed the inner not the outer law, the spirit not the form. For they knew the Presence; "the burden of the valley of vision" lay upon them. And this is the lack with the Judaism of our day—the inward living voice, the heaven-sent message. Loyal to the word, to the faith and God of their fathers Abraham, Isaac, and Jacob, they have nailed the law upon the door-posts, and bound it as a sign upon the brow and hands, and fringed their garments with it. More than this, they have kept the commandments and preserved themselves a pure and moral race. But even as a man may bestow all his goods to feed the poor, and give his body to be burned, and yet may not have charity, so a man may keep the law and the commandments and give his body to be burned and yet not have religion.

Who is blind but my servant? or deaf as my messenger that I sent? Who is blind as he that is perfect, and blind as the Lord's servant?

Seeing many things, but thou observest not; opening the ears, but he heareth not.

For religion is not alone a doing, but a being, a quality of soul, a motive power and principle. It is the hidden force which binds the seen to the unseen, the finite to the infinite, the human to the divine; which solves and fuses the whole nature of man, lifting him beyond the boundaries of time and space, the illusions of matter and sense, into the realm of true and imperishable being. To enter this realm it is not necessary to pass away from earth, but simply to be freed from earthly considerations and limitations, to rise above earthly prizes and rewards, and to come into spiritual possession; for this is the kingdom of heaven, although we may be still upon earth, we may suffer, and even fall into sin. But, dwelling in darkness and in the shadow of death, we may yet see light and life.

Deep in the heart of Judaism is enshrined a sacred, an immortal word—duty—which makes of man a moral being and links him to the moral source of the universe. Deep in the

heart of Christianity is enshrined a sacred and immortal word—love—which makes of man a spiritual being and links him to the divine source of all life. Humanity needs both these words in order to become the perfect creation it was meant to be. The one gives the conscience, the other the heart of mankind; the one is the masculine, the other the feminine element of the world. Judaism gives the Ten Commandments, and Christianity the Beatitudes. But only the two together can yield the perfect ideal—the love that is simply the highest duty, and duty that is lost in love. And, in order to come into this closer, higher union, into the faith which makes humanity whole, and not a thing of parts, and the truth which makes men free, fixed and formal codes must disappear; the outer framework of history and theology must fall away, and spirit be left free to seek spirit. Then, and then only, will life have its whole meaning, as part of a larger life whose beginning and end are hidden from mortal vision. Religion will have its full sway, and yet there will be none who persecute, and none who are persecuted, “for the earth shall be full of the knowledge of the Lord, as the waters cover the sea.”

Josephus.

THE CLOUD-MAIDEN.

SHE folds about her shining form
The azure mantle of the skies,
And sendeth earthward, kind and warm,
The gentle lightnings of her eyes.

She drifts in gold and azure furled,
This sweet, mad demon of the air;
Her love the kindest in God's world,
But when she hates, her hate beware.

She floats at heaven's gates when dawn
Spills in the east his rosy fires,
She comes at eve when day is gone,
Reviving all his dead desires.

All essences came to her birth,
The dews that drop, the airs that run.
She is the offspring of the earth,
The daughter of the flaming sun.

She is most kind to everything,
The thirsty grasses, buds, and flowers;
And to the poet's heart doth bring
Thought-blossoms from her skyey bowers.

The spirits of the upper space,
The swart, black genies 'neath the sea,
All for the glamour of her face
Are hers through all eternity.

They love, they hate, they wake, they sleep
Just as she waves her shining hands;
Just as she wills the deepest deep
Is stirred to do her heart's commands.

But when her mad, weird mood comes on
Her demons all go mad with her,
They shout the churning seas upon
And wrap the heavens in a blur.

She trails, a ragged witch in gray,
Across the heaven's wind-blown bars,
And in her ashen folds away
She hides the shuddering moon and stars.

And when she winds her ebon cloak
And leaps red leven from her eyes,
She rends the century-ringed oak
And laughs in thunder as it lies.

William Wilfred Campbell.

THE ALLIGATOR HUNTERS OF LOUISIANA.

IN THE LAGOONS OF THE TIDEWATER WILDERNESS.

MORE than thirty years ago information was brought from France to Louisiana to the effect that a large demand for the skins of alligators had sprung up in Paris. Occasional attempts to utilize this material had been made since the commencement of the century, but the alligator-hide industry had not materially advanced up to a date measured back by three decades.

The demand noted must have been inspired by some new application of the product in question. Whatever its cause, it proved to have been but a passing fancy among the Crispins of the French capital. It suddenly died out after a few thousand hides had been shipped from Louisiana. The alligator hunters, as a class, are not distinguished for their rapid acquisition of information. This fact I mean to demonstrate more clearly further on. They had been slowly convinced of the value of the products to be derived from this new pursuit, and consequently had been dilatory in reaping the harvest before them. Thus, after they had once started to reap it, when occasion required, they were also late in learning, or realizing, that their hard-earned spoils had lost their market value. They finally, under protest, appreciated the situation, and stopped their work of wholesale slaughter after the entirely unnecessary sacrifice of many thousand poor saurians.

During the civil war the supply of ordinary leather in the South was chiefly held by army contractors. Barefooted soldiers marched and fought in the Southern armies. Many of the women and children at home were unshod. There was of necessity another raid made upon the alligators down in the "Gulf States." They were again, by hundreds, slaughtered for their hides. But the alligator has meat, too. Raw, it is of a rich pinkish-white hue; in good condition, it is well streaked with layers of firm white fat. Bacon and beef were even scarcer at that time than leather. Finally those who began by hunting them for their skins actually learned to like their flesh. In Louisiana and the southern parts of other "Gulf States" this meat was, among the lower classes, largely used as an article of diet during the closing years of the late war. In Louisiana the taste then acquired has in many instances outlived the

promptings of necessity. There are many people living in that State to-day who consider steaks cut from the thickest part of an alligator's tail as an especial *bonne bouche*.

With the cessation of hostilities, and the consequent free circulation of beef, bacon, and leather, the saurians were again left to enjoy a period of comparative repose. Their rest was, however, only temporary, as a few years later fickle Paris again called them from the modest seclusion to which they had willingly retired.

The French demand for their hides has grown apace. Now the scaly epidermis of the reptiles is manufactured wholesale into boots, shoes, trunks, traveling-bags, gun-cases, reticules, wallets, portemonnaies, and into every other form of objects in the construction of which leather composes the whole or a part. It seems difficult to understand why this material should supplant common leather except for some unaccountable freak of fashion.

As a matter of course an immense demand for the article has been created, and a large number of alligators are slaughtered every year. The market value of their hides is quoted in the daily commercial reports of the New Orleans papers. It is within bounds to say that, in Louisiana, more than five hundred men are busily engaged in killing and skinning alligators.

Before describing the alligator hunters, it would be well perhaps to give a short account of the habits and habitat of the reptiles themselves. It is probable that the name of our saurian was bestowed upon him by the old Spanish colonists, who termed him "el lagarto," the lizard.

The reptiles are found in every tidal bayou, dead lake and lagoon, and gloomy cypress swamp of Lower Louisiana. Their omnipresence in the region roundabout caused the first representative government of New Orleans to adopt the reptile as the chief figure in the seal of the city. For lack of proper engraving talent in Louisiana the authorities ordered the seal to be executed in Paris. The French artist cut a couchant *crocodile* basking on a bank, with hills in the background. The alligator is markedly different from his Oriental cousin; and New Orleans is ninety miles distant from the nearest hill; hence the seal was inconsistent. Yet it served its official purpose, and to this day is duly attached to the formal mu-

nicipal acts and contracts of the southern metropolis.

Eminent scientists had stated, I believe, that only one variety of the genus alligator existed in North America. It is now recognized, however, that there are two distinct varieties in Louisiana. One of these is extremely thick and stout for its length, smooth on the back, and covered with small octagonal scales about the size of a "nickel" coin. The other is knobby in the head and neck, with a horny, serrated back and rude diagonal-shaped scales; and its body is proportionately longer than that of the first. Doubting that these distinctions were simply sex peculiarities, in the summer of 1874 I called the attention of the late Professor Edward P. Fontaine to the subject. Professor Fontaine was a distinguished student of natural history, having devoted a lifetime to studying the fauna of the Southern States. On being furnished with the two specimens, he immediately pronounced the reptiles as belonging to markedly different classes. He was at that time busily engaged in preparing a work on natural history, illustrated by his own hand. He expressed great pleasure "at the prospect of correcting another of the many errors made in the classification of animal life in North America."¹

I have seen numerous specimens of our saurian no longer than an ordinary lead-pencil; this was in the season of their hatching. I have also seen a few living specimens about sixteen feet in length. In the autumn of 1875 I obtained for the late Effingham Lawrence, Member of Congress, and Commissioner from Louisiana to the Centennial Exhibition, the dried skin of an alligator which, after at least fifteen inches had been cut from the snout and skull, and ten inches from the end of the tail, still measured seventeen feet ten inches in length. Allowing more than six inches for shrinkage in drying, this monster of his kind, alive, must have measured more than twenty feet. He was killed in the lower part of Bayou Lafourche.

Probably the largest alligator ever seen in Louisiana was killed in a small lake on the plantation of H. J. Feltus in Concordia Parish. According to the statement of Mr. Feltus, now of Baton Rouge, this specimen measured twenty-two feet in length. The great reptile had long been famous for miles around, having destroyed numbers of hogs and hounds owned in the neighborhood of his retreat. He had become so wary, from the number of ineffectual shots fired at him, as to be almost unapproach-

able. Finally he fell a victim to a long shot fired from a Mississippi rifle in the hands of Mr. Feltus, who had persevered in hunting him, having been the greatest loser by his depredations. The huge carcass of this reptile was towed to the bank by a boat. It required the strength of a pair of mules and a stout rope to haul it ashore, where the measurement was made with the result noted above.

In the marshes of Louisiana the reptile, before it lays its eggs, scrapes together a pile of dead grass and peaty soil about eighteen inches high, or just high enough to escape tidal overflow. On this mound the eggs are deposited, and after being lightly covered by a layer of the same material, are left to be hatched by the heat of the sun. These eggs are a little smaller than goose-eggs, and are inclosed in a tough, leathery, cream-white covering in place of a shell. The female appears to linger near the nest in adjacent waters. A "creole" negro can hardly be induced to rob one of these nests, as the race seems to have a traditional superstition that one of the eggs contains a small bell, whose sounding will call up the "mother alligator" and stimulate her to acts of ungovernable ferocity and frenzied power.

In the uninhabited wilderness our saurian preys upon any wild quadruped it may catch swimming in or drinking from the waters of its retreat; or it feeds upon fish, crabs, and crayfish, or even at times on the bulbous roots of flags and other marsh grasses. In an inhabited region their taste acquires an Oriental improvement. In a measure they become comparatively epicurean. Once having tasted canine flesh, they prefer dogs to any other diet; hence alligators are death to hounds led across their favorite bayous in the chase. Old hounds often learn to appreciate at its worth this undesired partiality, and will never swim a bayou infested by their foes. Young dogs are not, however, always so well informed or wise; or their superior ardor after the quarry impels them rashly to dare the known perils in the case; thus some of the finest packs of young deerhounds in this State have been destroyed by alligators.

It is even alleged that the reptiles have a *penchant* for negro children. I have never seen any direct proof of this grave accusation; though I have frequently been a witness of the fact that a large alligator will persistently pursue and drive to the bank negro boys bathing in the waters of this region, and have never seen any such hostile demonstrations made against white youths in the same predicament. A negro man fishing from a raft of logs fastened to Myrtle Grove plantation landing, about forty years ago, while dangling his legs in the current of the Mississippi River, was

¹ The Century Dictionary (1889) says: "A true American crocodile, *Crocodylus americanus*, long overlooked or confounded with the alligator, has lately been found in Florida and the West Indies."—EDITOR.

seized in the calf of one leg by a supposed alligator. He hung on to the logs and shouted for help. Assistance came in a short time, he was dragged up on the raft, his assailant relinquishing its hold before rising to the surface. The negro died from the injuries

and lagoons near the Gulf Coast. The means of conveyance used was a fine Louisiana hunting "pirogue," just large enough to hold two hunters and their camp equipage, and light enough for two men to carry when occasion required. When loaded she re-

LANDING A MONSTER ALLIGATOR.

inflicted, but though his death was charged to the alligator race, no reptile of the kind ever rose to the surface of the water near at hand to confirm the validity of the indictment against its tribe. However, in that region its strange preference for colored humanity is traditional among all classes. On the other hand, governed by a presumed law of reprisal, negroes are often very fond of alligator. It would be very near the whole truth to state that there is not in Lower Louisiana a "creole" negro of mature age who is not intimately acquainted with the flavor of alligator meat. Many not only deem it delicious, but consider it a panacea for many of the diseases to which humanity falls heir, particularly for rheumatism and cognate affections. Our saurian shows a decided aversion to tainted or putrid meat, notoriously spurns carrion floating down the currents of the Mississippi, and would probably even despise game mellowed up to the perfection of creole gastronomy.

In the early fall of 1880 I started from the Myrtle Grove sugar plantation in Plaquemines Parish, Louisiana, on a hunting expedition in the tidewater wilderness of marshes, bayous,

quired almost the skill of an Indian or Eskimo to keep her from upsetting. This boat was propelled by paddles. Her chief motive power on this trip, and many other similar expeditions, was Tom H——. Tom was in his way a peculiarity. He was a short, slim, sunbrowned mulatto, with a huge shock of nearly straight hair and a prominent Roman nose. About forty-five years of age, he weighed probably less than one hundred pounds, and could carry over two hundredweight of game and hunting effects, though fifty pounds were "too heavy to tote" in other work. He prided himself particularly on three things: the tendency of his hair toward straightness; "a little tech of Injin blood," which he confidentially claimed to me he possessed, and which claim was backed by such plausible characteristics as an inordinate fondness for whisky, a passion for hunting and fishing encouraged at the cost of agricultural pursuits, and a certain taciturnity of speech when the supply of whisky was not sufficiently liberal to suit his alleged requirements; and his third and chief subject for self-gratulation was that he was not a "creole nigger"—that is, he was not

one of the numerous race of descendants of French, Spanish, or West Indian slaves so numerous in Louisiana. He was brought from Virginia to this parish in Louisiana when a little boy. In 1863 his "apprenticeship" ceased, and Tom now "paddles his own canoe," and mine too — for a consideration.

From the back of the plantation, going southeast through a three-mile canal, we quietly paddled into a still bayou in the great tidewater wilderness, on our way to a large stream called Bayou Gros Loutre by professional hunters. This is a large, deep "dead" bayou, about ten miles from Barataria Bay. It is a part of the chain of the Bayous Dupont and Barataria leading from Barataria Bay up to the old "Portage" of the Lafitte Brothers, in Jefferson Parish on the Mississippi River, four miles above the New Orleans of 1812.

There are several bayous leading from the numerous bays and inlets on the Gulf Coast up to Barataria Bayou, fifteen miles below New Orleans; hence the difficulty of the revenue officers intercepting Lafitte, or his associates, who brought their contraband goods in small boats through any one of the dead waterways of this labyrinth. They were thus safely delivered near the "Portage," or scattered among the confederated smugglers along the river below the city; for all of the extensive plantations in this region were, and are, connected with the noted bayou system by their large drainage canals. In fact, many of these same plantations thus obtained a considerable part of their slave labor from the enterprises of Lafitte and his band. When unmolested Lafitte carried his goods up from Barataria Bay, first to the westward through Bayou St. Denis, thence through two lakes and an unnamed bayou to the Bayou Dupont, and from this into the Bayou Barataria, and up that stream to the place of debarkation above the old town. Rigault, Jean Lafitte's principal lieutenant, was often in charge of these small cargoes of contraband goods.

The writer has hunted in these same tide-water bayous with Rigault, a grandson, and with other descendants of the veteran smuggler and gallant warrior of 1800-15. I believe Rigault now resides on Grand Isle, near the mouth of Barataria Bay.

The sun was fast descending in the mellow October sky when Tom, tired probably of the monotonous though melodious "drip" of his paddle, pointed out some distance ahead a spacious shell-mound on the banks of the bayou as a very convenient place to camp. These mounds are peculiarities of the region, and its most striking feature. They are composed of immense piles of small shells shaped like clam-

shells, but it is not now possible to find in these waters a living mollusk of their apparently departed kind. The mounds rise like oases in a desert waste of reeds and rank grasses which, growing from a marsh periodically submerged by the tide, reach on every side in limitless fields of faded green and yellow to the distant horizon. This mound was densely shaded by a group of live-oaks festooned with pendent Spanish moss. Beneath the oaks was scattered, in clumps and clusters, a grove of stunted palmettos, some of whose trunks were grotesquely human in shape, and whose fronds of dark-green foliage, reaching out broad and stiff, resembled leaves of painted metal. As the sun was setting, the dreary waste around this mound seemed more desolate than a sea without a sail.

When the boat's bow grated on the sloping shells at the shore we jumped out, fastening her light painter to the gnarled roots of an isolated live-oak standing near the water's edge. The bank of shells ascended in an even incline, about a hundred feet broad, up to the main group of live-oaks and palmettos. Between these and the bayou the mound was white and bare of herbage. Near the center of this open space was a dark spot, where a few charred fagots and a little heap of ashes and calcined shells remained from a fire which had apparently died out a long time since. A few yards to the left of the remains of this fire appeared a deep excavation in the mound, with no expected heap at its edge. About twenty feet to the right of the charred sticks were seven or eight long skeletons laid in a row. They were the bones of dead alligators, picked by buzzards and marsh-rats, and finally polished by ants. I turned to Tom, asking him what it meant. He paused in his silent work of unloading the camp equipage, looked first at the charred fagots and the row of skeletons, then absently gazed for a longer time far down the bayou. He then answered:

"Well, you know, sir, 'fore de war, when I fust seed sech a sight, after I come back home and tole it, dey said dat was an allergaters' buryin'-place; dat when dey knowed dey was gwine to die, dey jest creeped outen de water, and crawled up on one of dese lonesome shell-mounds and died peaceful-like. I did n't respuite it, but I studied on it, an' arter dat I seed what it was for myself. I comed up on a camp of alligator catchers, and seed what dey was doing. Yes, sir; I tell you de alligator catchers done camped here 'bout two months ago." As to the excavation, Tom explained that shell scows had carried away, more than thirty years ago, shells dug from this mound to pave the walks around the grounds of the "Gret House" on the plantation, "in Mr. Theodore Pack-

HUNTING FOR ALLIGATOR.

wood's time." These replies being satisfactory to all parties, Tom pitched camp, and afterward quietly cooked our supper.

As the night advanced the darkness almost added a sense of oppression to the surrounding desolation. The sky was moonless. The low monotone of the surf beating on the beach at Barataria, miles away, heightened the effect of the solitude. Occasionally the endless moan of the distant sea was interrupted by the melancholy whoop of the great blue night-heron, sounded in the bird's lazy, unseen flight to some favorite lagoon; or by the sullen, gurgling plunge of a garfish in the waters of the still and deep bayou. These waters, smooth

and black as the darkness itself where they remained unruffled, blazed with their characteristic weird phosphorescence, that shone and gave no light, when disturbed. The ripples and waves left in the track of large fish glowed with this light, that flashed forth so strange yet bore no reflection. The fading embers of our fire brought out in pale relief, from the dark-green foliage above, the long tresses and looped festoons of gray moss hanging on the live-oaks; while their dull-pink glow touched up with a coppery tint the broad, pointed, metallic-looking leaves of the palmettos, and made their contorted trunks assume more fantastic shapes against the background of black darkness be-

yond. The sense of loneliness is so great when camping out at night in the midst of this comparatively limitless and uninhabited waste that, by most people so situated, the hoot of an owl would be hailed as a sound of mirth.

However, we did not hear the bird of Minerva; but I started at the crack of a distant rifle. Tom, without turning from his seat, or rather squat, before the dying fire, whose embers he was then raking to get a coal for his pipe, said, "Dem 's alligator cotchers, 'way down de bayou." It was easy to distinguish the report heard as that of a rifle, for the boom of a duck-gun would have gone reverberating and rumbling over these marshes several seconds after the first detonation, while the small grooved bore fails to awaken an echo with its sharper report. After listening some time vainly for another shot, I proposed to Tom that we should paddle down the bayou to meet the "alligator cotchers." Without having much choice in the matter he quickly stopped puffing his successfully lighted pipe to give this proposition his eager assent. Soon the little boat, lightened of all its load of "plunder" except a "ten-gauge" breech-loader, was swiftly cleaving the waters of the winding bayou.

Two miles of this rapid and silent traveling brought in view a distant light hovering near the edge of the water. This mysterious yellow light grew at one moment into a circle half the size of the full moon when in the zenith; then it dwindled the next minute into the shape and appearance of a very small half moon with a broad, clearly marked band of light, like the tail of a comet, reaching out in the darkness. Afterward for a time it would disappear altogether, reappearing soon as a crescent with a comet's tail, going out at once or growing again to its full circular shape, losing its tail and gradually changing as before. Without any preface Tom quietly remarked, "Dat's a bull's-eye lantern"; then he suddenly shouted a shrill, prolonged hail, which certainly must have reached as far as the report of the rifle. He immediately afterward explained to me that this shout was "to keep dem alligator cotchers from shootin' our way."

The hail was duly answered, and going ahead for nearly half a mile, we were soon alongside a long skiff, against which Tom drew our smaller craft by holding the other boat's gunwale. This skiff was occupied by two men, who saluted us in Creole-French as we grated against the side of their boat. The man in the bow wore a "bull's-eye" or common deer-hunting lantern, containing a large convex lens in a tube a little shorter than its length of focus. The body of the lantern, standing vertically, was fastened to his cap by a band of leather, which passed through the metal

handle of the light, and, passing completely around his headgear, was fastened at the back by a buckle. The tube of the lamp, with the lens, stood out horizontally over the hunter's nose. The lamp inside, placed within the focus of the lens, sent out a long, gradually expanding beam of bright light; of course, when we saw the light, as at first, pointing directly toward us, the beam was invisible.

The light-bearer held in his hand a long small-bore rifle. His companion, sitting on a bench just aft of the middle of the boat, managed a pair of oars, with which he rowed face forward, thus shoving on his oars instead of pulling. His oars, instead of being placed in ordinary rowlocks, were lashed to single wooden thole-pins by a leather thong. This arrangement was to prevent noise in rowing, and served well the purpose of muffled locks. By the faint light reflected around from the changing beam of the dark-lantern it could be seen that both men were clad in the characteristic faded cotton-velveteen hunting-suits of the Louisiana swampers. Their Creole-French and broken English subsequently confirmed the first impression, that they belonged to that primitive Creole race of hunters and fishers who are as much the nomads of this wilderness as ever were the wandering Arabs in their own deserts.

The rifleman was a swarthy, grizzled old man. His countenance, in the dim, fitful light, would have fully justified a suspicion of lurking piracy in its possessor. He deserved it, however, no more than many of his ancestors, whose reputation, for half a century at least, was clouded by false and fabulous charges concerning the committal of the deepest crimes known on the highways of the sea. It would be a compliment to the intellect of the class to which he belonged to grant that it was even capable of the conception of such deeds. Time and tradition, however, will always place his community among the happiest, most ignorant, and most inoffensive in the world. The bolder bucaners, with whom these people were once charged with collusion, lived on the sea-shore at Barataria Island, Grand Isle, and the coast to the westward, while these Creole hunters have always even been afraid of the sea. The younger man called his elder companion Paul. I have met many of the denizens of this marsh wilderness, and never yet heard one called by a second, or surname. Possibly the title may be superfluous. The rifleman termed the rower "Colan" (a Creole abbreviation of Nicholas) when he addressed him at all, which was seldom. The younger man was more loquacious. He was brown as to the skin of his face and bared arms, and black as to the heavy mop of hair hanging even down to his bushy eyebrows;

and he held in his mouth a cigarette wrapped in brown paper, whenever relaxation from rowing permitted him to roll one.

On being asked the object of their singular expedition Colan answered, in a mixture of English, French, and Creole, "For kill li caymans" (kah-ee-mar)—which meant in

That was a night scene worthy of the pencil of Doré! A dim, desolate waste of marsh; dark and still waters, glowing here and there with streaks of pale phosphorescent light, where some ravenous fish pursued his prey, or dotted with the diamond brilliance of reflected stars; a silent, indistinct, gliding boat, rowed, with-

SHOOTING AN ALLIGATOR.

plain English to kill alligators. They readily consented to my joining them in this strange hunt if I and Tom would "*restez parfaitement tranqui*." The reason for this extreme quiet, and especially for night-hunting, may be better understood when it is stated that the modern demand for alligator-skins has so stimulated the pursuit of these reptiles that, in many of their haunts, they have become wary and unapproachable by day.

I entered the skiff, taking a spare bench immediately behind the old alligator hunter. Tom, by request, remained in the pirogue, which was towed astern by a short line. The stout young oarsman resuming silence, as if by an effort, and vigorously puffing at a new cigarette, rolled during the interlude of conversation, gently lowered his oars in the water, and the long skiff crept slowly ahead, propelled by a noiseless power. The only indication that she moved at all was heard in the scarcely audible gurgle under her bow, or seen in the reflected stars dancing about where the blades of her muffled oars disturbed the water.

out the sound of oars, by a figure speechless as the ferryman of the Styx; a tall, gaunt form standing in the bow, from whose head reached forth, far out over the black waters, a sharply defined beam of ghastly light, which only made the surrounding darkness darker. The only sound heard was that endless monotone of the sea, rolling its long, ceaseless waves on the sands of Barataria Island.

"*Coutez donc!*" exclaimed Paul; we all listened, but I could hear nothing except that hoarse boom of the distant surf.

"*Cayman est ça,*" muttered the grim old rifleman. "*Moins entend li,*" ejaculated Colan. A few moments later I distinguished a sound like the grunt of a wallowing hog, followed by a long, low, guttural groan, which I instantly recognized as the "bellowing" of a full-grown alligator. Colan headed the boat in the direction of the noise. The beam of light shone far ahead in an oval glow over the surface of the water. The bellowing gradually grew louder; then it ceased altogether. Soon in the center of the broad, dim disk of

light, projected by the lantern some distance beyond the bow of the skiff, glistened two points of brighter light, like the sparks of marsh glow-worms. As we approached them the two faintly glowing spots seemed to grow farther apart. At last they seemed to be separated by about eight inches of space, and to be located near the end of some long, dark, yet indistinct body floating near the surface.

"Oh! C'est grand cayman," ejaculated Colan, in a loud whisper.

The two lights instantly disappeared, and the long, dark body had sunk out of sight. The old rifleman, turning around with a gesture of deep disgust, threw the contracted beam of the lantern full on the rower's face; the latter's countenance became a study: it was suddenly *shrugged* into a depiction of dejection, contrition, and despair. The old man again flashed forth his beam over the waters, mumbling an imprecation at the stupidity of his colleague in thus unseasonably breaking silence, and emphasizing his mutterings with an occasional deep-breathed "*sacré-é-é!*" The oars were stopped, resting in the water; the skiff half turned, drifting in the sluggish tide; the long beam of the lantern, with its oval disk of dim light resting far out on the surface, swept slowly around over the waters looking for the two lost lights. Ten minutes or more thus passed, and suddenly the two lost sparks gleamed back in a new direction. A gentle, noiseless push on the port oar headed the skiff toward them again. "*Doucement!*" whispered Paul. His associate, still more gently, guided the boat to the left, till only one light shone from the obscure object in the water. This showed that he had got on its side, as was desired, because a forward shot always glances. Cautiously the silent oarsman again turned his craft to the right. Paul raised his long rifle ready to fire. The disk of the lantern on the water, contracting gradually, grew proportionately more brilliant. As it contracted the solitary light shining back on the water from its center became larger and brighter, till at last the eye of the great saurian glittered as if he had the "*Koh-i-noor*" itself in his head. Slowly, silently, nearer, the boat moved, till within ten yards of the reptile. The glow of the lantern flashed along the barrel of the rifle for a few seconds; then came the ringing report. The light on the water instantly went out, and the glow of the lantern, now shining in a circle only a few feet in diameter over the place where it disappeared, showed only a few foamy bubbles and little whirlpools. Thirty seconds passed in silence; then an immense dark form bounded from the depths below above the surface of the water, and rolling over on its back, showed the broad,

yellow-white belly of an enormous alligator. The shuddering reptile remained otherwise motionless for a few minutes; then, spasmodically stretching and stiffening its ugly legs and feet, and leaping half its length in the air, fell back again, beating the water with its tail in blows sounding as loud as the report of the weapon which had slain him. "*Moi tué li,*" muttered Paul in an accent of quiet triumph. His associate, after a few exclamations of more voluble admiration, rolled another cigarette, and quietly turned his boat off in search of other game.

In a few hours of this hunting five alligators were shot. All were left in the water that night. Paul explained that their bodies would rise before morning; and, as his temporary camp was some distance down the bayou, he would catch them floating by in the slow, outgoing tide and tow them ashore.

Leaving the hunters, we returned to our own camp, which was reached shortly after midnight.

The next morning I visited the alligator slayers, who were encamped on a smaller shell-mound several miles distant. There I found that they had already secured all their game of the previous night. Some of the long carcasses lay floating in the water at the margin of the bayou, where they were secured by short lines tied to the stem of a stout mangrove bush or tree growing near the bank. Paul and Colan desisted from their work of skinning the largest reptile, which they had drawn ashore on the sloping shells, to salute us, and invite us to take some coffee. If the weather be dry, a small pot of hot coffee is at all times of day and night found near the embers of these hunters' camp-fires. Their place of shelter, in front of which they worked, was a temporary shed of newly cut palmetto-leaves raised on forked poles. Under the shed, protected from the dew, was part of a sack of salt, used for curing the hides—and some of the meat, too. All of the alligators had a hole in the head, immediately behind the eye, where the rifle-bullet had passed through the brain. The reptile they were engaged in skinning, Colan exultingly informed me, while wiping his bloody hands and wrapping another cigarette in brown paper, was the "*grand cayman*" of last night, which dived and rose again. It was apparently about sixteen feet long—as long as any living specimen I ever saw in Louisiana.

Slices of alligator meat, salted, were hanging around on the bushes, drying in the sun. The hunters explained to me that these were to be taken home and kept as bait for their crab-lines in the winter. This was plausible, for during the colder months they stretch long lines across the lakes and bayous in this region. At

intervals of a few feet, shorter cords, baited with pieces of alligator meat, are attached to the extended lines. The crab-fishers, in their boats, pass up and down these long lines, pulling in the baited cords with crabs attached. They

hunt for the "season," in which they had secured, salted down, and sold in the New Orleans market over three hundred hides.

When the first decided "norther" of the fall sets in, these hunters, in small squads, take to

A PEACEFUL HAUNT.

soon thus catch a skiff-load of the prized crustaceans, which are at once transported to New Orleans, and there sold, "by the basket," to market venders. Tom looked incredulous, but said nothing. He afterward remarked to me alone, "I don't respuite what dey say, sir; but I believes dey goes pardners wid de crabs eatin' dat meat, when game is sca'ce."

These men are alligator hunters only when the warm weather has driven game back to the breeding-places and feeding-grounds in the far north; or when the heated waters of the lakes and lagoons compel the fish to seek the more temperate currents of the open sea. They hunt alligators during the hot months. They live far up from the gulf, in rude palmetto-roofed shanties and huts made of split cypress boards, on the banks and bordering shell-mounds of Lake Salvador, Bayous des Allemands, St. Denis, Dupont, and Barataria, and numerous other sluggish tidal streams and lakes in the great tidewater wilderness of Louisiana. Paul and Colan informed me that they lived at the junction of bayous Dupont and Barataria and that this was their last alligator

their lighter pirogues, and turn to hunting ducks and snipe, or to fishing and crab-catching. In the spring, after the game has gone, they cultivate small truck-patches around their humble dwellings. Their summer occupation has already been pictured.

If these simple people were educated, the sphere of their wants would probably be enlarged, and they might be impelled to practise to some extent, in connection with small sea-going vessels coming near the coast, the "free-trade" methods so long successfully followed by bolder men on the coast islands, and carried on through the labyrinthian waterways of this same wilderness. But they are neither educated nor adventurous, and their wants are few. The region in which they reside is uninviting to more civilized communities. So they will remain, as they have been, for ages, unmolested by the inroads of a superior race, and in undisputed possession of their dismal, moss-draped cypress swamps; their lonely shell-mounds and live-oak groves; their desolate wastes of sea marsh; and their dead lakes and silent lagoons.

Andrews Wilkinson.

WITCHCRAFT.

By the author of "Astrology, Divination, and Co-Incidence," "Faith-Healing and Kindred Phenomena," etc.

The art is old and new, for verily
All ages have been taught the matter.

GOETHE.

ADDISON says that among all the poets who deal with fairies, witches, magicians, demons, and departed spirits, the English are much the best, "and among the English Shakspeare has incomparably excelled all others. There is something so wild and yet so solemn in his speeches of his ghosts, fairies, witches, and the like imaginary persons, that we cannot forbear thinking them natural, . . . and must confess, if there are such beings in the world, it looks highly probable that they would talk and act as he has represented them."

As Addison saw his fatal day thirty years before Goethe's natal star arose, he could not compare the prince of German poets with others; but if the ruling sentiment of modern critics may be accepted, Shakspeare's ghosts and witches still maintain their superiority. These are "the secret, black, and midnight hags" that brewed the charm for Duncan's murder, and the familiar but ever awe-inspiring ghost of Hamlet's father:

I am thy father's spirit,
Doomed for a certain term to walk the night.

But the fancies of poets can give no help to him who deals with one of the darkest tragedies of humanity, the only stain on the ermine of Sir Matthew Hale,—whose fame without it would rival that of Daniel for wisdom, as it does for integrity,—and the chief stigma upon the early history of New England. Nor is witchcraft of the past only: for by many theologians it is believed to reappear in modern spiritualism, and by a multitude of Christians to be a

reality, because, as they suppose, it is plainly asserted in the sacred Scriptures; and its baleful spell still holds four fifths of the fifteen hundred millions of the human race "fast in its slavish chains."

DEFINITION.

FROM the earliest ages religions, true and false, claimed divine aid, and their production of effects by other than natural causes was considered by all except avowed unbelievers to be lawful. The supernatural is occult; but the latter word is used only to apply to the illegitimate, and to the imaginary sciences of the middle ages. As the terms at first employed were descriptive, rather than definitive, they came naturally to be used promiscuously, one word sometimes standing for everything preternatural exclusive of religion, and at others for a single form of such action. In an English book dating from the middle of the sixteenth century most of these ancient terms are included in a single sentence: "Besides the art magyck, sortilege, physnomye, palmestrye, alcumye, necromancye, chiromancy, geomancy, and witchery, that was taught there also." (Bale, "English Votaries.")

Magic, applied by the Greeks to the hereditary caste of priests in Persia, still stands in the East for an incongruous collection of superstitious beliefs and rites, having nothing in common except the claim of abnormal origin and effects. Astrology, divination, demonology, soothsaying, sorcery, witchcraft, necromancy, enchantment, and many other systems are sometimes included in magic, but each term is also employed separately to stand for the whole mass of confused beliefs which, outside of the sphere of recog-

nized religion, attempt to surpass the limitations of nature. For this reason the title of a work on this subject seldom indicates its scope.

But witchcraft has been restricted by usage and civil and ecclesiastical law until it signifies a voluntary compact between the devil, the party of the first part, and a human being, male or female, wizard or witch, the party of the second part,—that he, the devil, will perform whatever the person may request. The essential element in witchcraft as an offense against religion and civil law is the voluntary nature of the compact. Possession by the devil against the will, or without the consent of the subject, belongs to a radically distinct idea. The sixth chapter of Lord Coke's "Third Institute" concisely defines a witch in these words: "A witch is a person which hath conference with the devil, to consult with him to do some act." English laws in 1655 define witchcraft as "Covenant with a familiar spirit, to be punished with death."

CURRENT BELIEF.

WITCHCRAFT is at the present time believed in by a majority of the citizens of the United States. The larger number of immigrants from the continent of Europe are more or less in fear of such powers. To these must be added no inconsiderable proportion of persons of English and Scotch descent; for a strong vein of superstition is discernible in many Irish, Scotch, and some English, whose "folk-lore," diffused in nursery tales and neighborhood gossip, has entwined itself strongly about the fibers of spontaneous, subconscious mental imagery. Among the more ignorant members of the Catholic Church of every nationality the belief produces a mysterious dread, against which men and women cross themselves, and resort to various rites supposed to be efficacious.

Where colonies of immigrants have remained isolated, retaining the use of their own language, the influence of witchcraft is more easily traced. The interior of Pennsylvania affords better illustrations of this, and on a larger scale, than any other State. It has been but two or three years since suit was brought by a man against his mother, in one of the counties of Pennsylvania, to recover damages for a dog which he charged her with having killed by witchcraft; and he not only brought suit, but obtained judgment from a justice of the peace. Various witnesses testified as to their experiences in witchcraft, and only one said that he had never had a friend or relative who was bewitched.

In divers villages in Pennsylvania, some of them in the Dunkard settlement, are women who are supposed to be witches. Some are shrewd enough not to apply their arts for

strangers, but to those whom they know, as stated in an article in the New York "Sun" some years ago, they will sell charms to ward off lightning from buildings, dry up the wells of the enemies of applicants, force cows to give bloody milk, cause sickness in the family, destroy beauty, separate man and wife, and reunite estranged lovers.

In the interior parts of the Southern States, where a large proportion of the white population cannot read, and there is little admixture of society, there are "witch-doctors," who, assuming that all disease is caused by witches, secure thriving practice in counteracting their influence. The Philadelphia "Times," on the authority of a reputable correspondent, who gives many facts to sustain his representations, says: "For generations the poor whites have believed in witches, and the belief is deep-seated and incurable."

The African population brought this belief from the Dark Continent, and it persists among them to this day, though the progress of religion and education is doing something to check it.

I have recently noted in various parts of the United States more than fifty suits instituted by persons against those who they claimed had bewitched them; but under existing laws the accused could not be prosecuted except where money had been obtained under false pretenses, or overt acts of crime had been suggested or committed.

During pedestrian tours in New England, in various parts of the West, and in every Southern State, I have frequently stayed for the night at the houses of poor farmers, laborers, fishermen, and trappers. In such journeys I have invariably listened to the tales of the neighborhood, stimulating them by suggestion, and have found the belief in witchcraft cropping out in the oldest towns in New England, sometimes within the very shadow of the buildings where a learned ministry has existed from the settlement of the country, and public schools have furnished means of education to all classes. The horse-shoes seen in nearly every county, and often in every township, upon the houses of persons, suggested the old horseshoe beneath which Lord Nelson, who had long kept it nailed to the mast of the *Victory*, received his death-wound at Trafalgar.

In Canada the belief is more prevalent than in any part of the United States, except the interior of Pennsylvania and the South. In the French sections, exclusive of the educated,—a relatively small number,—the belief, if not universal, is widely diffused. But it is by no means confined to Canadians of French extraction. Until within a few years the descendants of the English and Scotch in many parts of British

America were more widely separated from each other and from the progress of modern civilization than the inhabitants of the United States, or the settlers of the more recently populated continent of Australia, making due allowance for certain sections of New Zealand and Tasmania. In all these regions the educated generally dismiss it as a mystery, or repudiate it as an ancient superstition. Nevertheless it is often found in the more isolated communities, hamlets, and rural districts, liable on slight provocation to manifest itself in superstitious fears, insinuations, and accusations.

In the West Indies this belief prevails among the negroes, and is not unknown among the more ignorant whites. Of South America and Mexico travelers, missionaries, and foreign residents bring similar accounts.

In Italy those of the people who are not Protestants or free-thinkers generally believe in the possibility of witchcraft, and to the peasants it is a living reality. Nor are all who reject the Catholic Church or avow irreligion free from credulity as regards occult influences. Modern Greece, Bulgaria, Servia, and the neighboring States abound in similar superstitions. The common people of Hungary and Bohemia fear witchcraft, and it still dominates a considerable part of the rural population and the allied classes of Germany, and particularly of Austria.

French peasants are afraid of evil eyes, warlocks, ghosts, spells, omens, enchantments, and witches; not in every part of the country, but in the more primitive sections. In France their persistence is promoted by dialects, kinship, and other influences peculiar to the country. It has been but a few years since the world was shocked by the burning of an old woman as a witch in the district of Sologne, cupidity and superstition leading to the crime. Having softening of the brain, she did and said strange things, from which her children concluded that she was a witch and determined to burn her to death. When the time decided upon arrived, they sent for a priest, who confessed her. Soon after his departure her daughter screamed, "It is greatly borne upon me that now is the time to kill the hag; if we delay she may commit a sin in thought or deed, and the confession will go for nothing." As she burned, two of her three children cried, "Aroint thee, witch!" I do not refer to this to intimate that the French people sympathize with such things, for all France was filled with horror, and the murderers were brought to justice, but as an illustration of the persistence of the belief.

In Norway, Sweden, and Denmark witchcraft still throws a spell over many of the sailors, fishermen, and solitary farmers. In Lapland sorcerers and witches abound, the witches

claiming the power of stilling the wind and causing the rain to cease. It has been a comparatively short time since English seamen trading in Archangel were in the habit of landing and buying a fair wind from the witches.

But it is in Russia that the popular belief more generally resembles that of the whole world many centuries ago. Ralston, in "Songs of the Russian People," states: "But a little time ago every Russian village had its wizard, almost as a matter of course, and to this day it is said there is not a hamlet in the Ukraine that is not reported to keep its witch." When I was traveling in the interior of that country, accompanied by a master of the Russian language, I found that the peasants still believe that witches and wizards can steal the dew and the rain, send whirlwinds, hide the moon and the stars, and fly through the air on brooms and tongs. Their chief meetings take place three times a year, on "bald hills," and there are thousands of stories of witches going up chimneys and flying through the air; an analogy exists between these and the ancient German legends on the same subject. They chalk crosses on their huts and windows, hang up stove-rakes for protection, tie knots, and wear amulets. Plagues in men and cattle are popularly attributed to witches. Epileptics, and those afflicted with St. Vitus's dance, are supposed to be bewitched. According to popular belief in Russia, witches assume the form of dogs and cats and owls; but the shape they like best is that of a magpie. The Metropolitan Alexis solemnly cursed that bird, "on account of the bad behavior of the witches who have assumed its plumage."

In Scotland, Ireland, and England the belief in witchcraft lingers, and only those who are at the pains to inquire how far it extends, and how strong the impression is, can form an adequate idea of either.

LOOKING BACKWARD.

It is important to notice how late in the Christian era individual belief, popular excitements, and judicial proceedings have been sufficiently conspicuous for permanent record.

In "Reports of Trials for Murder by Poisoning," by Browne, a barrister at law, and Stewart, senior assistant in the laboratory of St. Thomas's Hospital, a standard work for physicians, chemists, and jurists, published in London in 1883, I find the case of Dove; and that in the said trial various references were made to the prevalence of the belief in witchcraft among persons of the prisoner's class. It appears from the evidence that his interviews with the witch-man on the subjects of lost cattle, removing strange noises from his house, the bewitching of his

live stock, and the deaths of persons inimical to him, and the promise of the witch-man to get him out of all difficulty, which led to the murder, were in the summer and autumn of 1855 and the spring of 1856.

In 1846 in England, and in 1845 in Scotland, cases of witchcraft attracted much attention.

The following case of witchcraft occurred in England about fifty years ago, and the son of the subject, now one of the most highly respected and well-informed clergymen west of the Alleghany Mountains, noted for his devotion to the physical sciences, writes me concerning it :

My father, like many others, fully believed in witchcraft. In a little ancient cottage about a mile from my father's lived an old woman who had the reputation of being a witch. One spring, as my father was planting potatoes in his field, the old lady came to him to beg a piece for a garden. This he said he could not grant, as he needed all for himself. She left the field muttering something, which I suppose my father understood to mean mischief. That evening, when still in the field, he was seized with a strange nervous sensation, and an utter inability to speak. Later in the evening he had a severe fit. This state of things continued for some years. Mother always sent one of the boys with him to render help or report his condition. Another phase of the witchcraft superstition was a belief in white witches, or those who could neutralize or destroy the work and influence of witches. My father heard of one living many miles away, and at once went to see him. I shall ever remember the interest with which we listened to his story. He said the white witch told him that he had been bewitched, as he supposed, by the old woman, but that her influence could be entirely destroyed. He then gave my father a little piece of paper upon which was written a charm which would in all future time protect him from all influence of witches. This paper must be worn over the breast, suspended by a piece of tape from the neck. It must never be opened, never touch wood, stone, or iron, nor be handled by any one but himself. Said my father in concluding his story : " The white witch told me to always wear this over my breast, and that inside of three days I shall have one fit more, but after that I will never have another symptom of the kind." The following evening when at supper he had another severe attack of his old trouble, but sure enough it was the last. He lived more than twenty years after that, but never had another symptom of fits, or nervous difficulty of any kind. He was absolutely cured, as I know.

In March, 1831, the case of an old woman in Edinburgh came before the court on account of her being attacked.

In 1827 a man was burned as a wizard in southwestern Russia ; and in 1815 a person in northern Russia was sentenced by a legal tribunal to undergo thirty-five blows of the knout,

as well as a public church penance, for witchcraft.

In 1815 Captain Samuel Wardwell of Maine, captain of the schooner *Polly*, desiring to excel all his competitors in the number of trips made between Boston and Penobscot in one season, hired Mrs. Leach, a reputed witch, for a bushel of meal a trip, to guarantee him fair winds.

" Moll Pitcher," so famous that for more than fifty years " to her came the rich and the poor, the wise and the ignorant, the accomplished and the vulgar, the brave and the timid," died April 9, 1813, in Lynn, Massachusetts, aged seventy-five years.

Contemporary with her lived a woman in Newburyport, who came originally from Scotland in 1759 or 1760. Her career for many years was such as to command the respect and fear of the people. Mr. Samuel L. Knapp, who wrote in 1825, speaks of another supposed witch in Massachusetts named Danforth, who lived in a gloomy, hollow glen. On this Mr. Samuel G. Drake, writing in 1869, says :

The writer is not as old as he from whom the above extracts are made ; but it was his fortune in youth to be acquainted in many towns, in nearly all of which there was a reputed witch.

In 1751, in Hertfordshire, two harmless people were mobbed, the woman beaten to death, the man nearly so. A similar incident happened as late as 1776 in Leicestershire. In Burlington, New Jersey, in January, 1731, a man and woman suspected of bewitching cattle were tried in the presence of the governor, by being weighed against a large Bible.

In 1728 Rhode Island reenacted its laws against witchcraft, which implies some agitation upon the subject ; in 1720 there was a case in Littleton ; prosecutions occurred in South Carolina in 1712 ; in 1706 there were disgraceful scenes, persons being subjected to ordeals and various barbarous tests ; and in the year 1700 an execution for witchcraft took place in Albany, New York.

In noting these events we have reached the period of the dreadful outbreak in New England, which was separated by but a few years from a yet more dreadful frenzy of human nature in England, Scotland, and on the continent of Europe.

REVERSING THE POINT OF VIEW.

WHENCE came witchcraft ? Writings, pictures, monuments, ruins, and traditions preserve the history of mankind ; but man himself, in color, configuration, unconscious gesture, language, rites, customs, and unwritten laws, is a true encyclopedia of humanity more valuable than the contents of libraries.

As a general proposition, the uncivilized tribes of the world may be said to have been, from prehistoric times, what they are now. Mounds and other remains of uncertain date indeed often show a higher degree of development than at present exists among the inhabitants of particular regions; but this is not conclusive proof of degeneration, because of the vastness and complexity of ancient migrations of which no adequate history remains. The state of primitive uncivilized mankind, when widely scattered and numerous in population, may therefore be inferred from the present condition of barbarous tribes. In all these witchcraft is believed in, producing a mortal dread, and its practice punished by death in the most horrible forms. In China, India, and Japan it has always existed and still prevails.

Of the ancient empires, the Magism of the Median court, with its incantations, divining-rods, omen-reading, and dream-expounding, became closely allied to witchcraft, as in Scythia in previous ages, and subsequently in Persia. Many of its practitioners openly avowed the aid of evil spirits. While both Magism and Zoroastrianism had an essentially religious basis, witchcraft hung upon their skirts continually endeavoring to rival them. In Babylon the Magi included the scientists and philosophers of the age; but as quacks are parasites upon modern scientists, deriving from general names held in common with those entitled to them a particular reputation with the common people while practising the most shameless delusions, so many of the Babylonian astronomers were astrologers, and others of the Magi dealt avowedly with spirits.

In Egypt, notwithstanding the sublimity of the religion which taught a system of morality based upon a final judgment, a swarm of the basest superstitions and the most demoralizing influences counteracted its influence; and witchcraft prevailed among the people at the very time that Egypt was surpassing the world in science. In Benjamin's sack was found Joseph's cup, "whereby, indeed, he divineth"; and his own words, "Wot ye not that such a man as I can certainly divine?" reveal the custom in Egypt.

The various forms of consulting evil spirits, of seeking illegitimately preternatural help or knowledge, were all practised by the Canaanites and their descendants the Phenicians. Isaiah traces the existence of such things back to the Chaldeans and the Babylonians.

The answer of the Chaldeans to Nebuchadnezzar showed that throughout the world such a class existed; for they said, "There is not a man upon the earth that can show the king's matter; therefore there is no king, lord, nor ruler that asked such things at any magician, or astrologer or Chaldean."

THE ISRAELITES AND WITCHCRAFT.

THE Israelites came from a people surrounded by idolatry, and addicted to sorcery. They appear to have believed for a long time in the reality of the gods of the heathen, considering them inferior, however, to the God of Abraham, Isaac, and Jacob, and were continually lapsing from the true faith into idolatry and sorcery. During the hundreds of years that Jacob's descendants were in Egypt their faith was greatly corrupted; when Moses tarried long in the Mount, they compelled Aaron to make a golden image to represent God. Surrounded by the Egyptians, and in the midst of the Canaanites, who were not wholly driven out for centuries, their kings and many of their people frequently relapsed into witchcraft and idolatry.

Solomon, according to all the traditions of antiquity, as well as the testimony of the Bible, turned both to idolatry and magic. In D'Israeli's "Curiosities of Literature" (Rabbinical Stories) it is said, "He is a favorite hero of the Talmudists, and the Arabs also speak of him as a magician." The son of the godly Hezekiah, Manasseh, "practised augury, and used enchantments, and practised sorcery, and dealt with them that had familiar spirits, and with wizards." There never was a time in the history of Israel that among its people were not those who practised every form of divination, astrology, magic, and witchcraft.

WITCHCRAFT AND CHRISTIANITY.

CHRISTIANITY originated among the Hebrews, who were firm believers in the reality of witchcraft. It was immediately brought into contact with the Romans, of whose empire Syria was a province; and with the Greeks, among whom it spread during the apostolic age. Among the Greeks and Romans the same general belief, with the corresponding practices, existed. Homer is said to have derived many of his verses from Daphne, the daughter of Tyreseis the Soothsayer, who was considered to surpass all women in the art of divination. Scot, in his "Discoverie of Witchcraft," gives extended extracts, among others the passage in Ovid:

Witches can bleed our ground by magic spell,
And with enchantment dry the springing soil;
Make grapes and currants fly at their command,
And strip our orchards bare without a hand.

Virgil and Horace make similar references. Lecky affirms that "Sorcery could say with truth that there was not a single nation of antiquity, from the polished Greek to the rudest savage, which did not admit a real art enabling men to foretell the future."

In Asia Minor and adjacent Oriental countries Christianity was saturated with superstitions of every kind, the entire mass directly or indirectly affecting Christians of every nation. The New Testament shows that Christianity did not at once eradicate preëxisting superstitions. It required a renunciation of the worship of idols, faith in God as superior to all antagonistic forms, natural and supernatural, and obedience to the precepts of Christ and his Apostles; but there is no reason to believe that it distinguished concerning the natural or supernatural origin of many superstitious beliefs not essentially incompatible with submission to the Gospel. The credulity of the early Christians is apparent in the writings of most of the ante-Nicene fathers. They believed in the supernatural origin of many of the alleged pagan miracles, some of them in the fable of the phoenix, and were prepared to accept any incredible tale which could be credited to the devil or his agents. Extraordinary knowledge, devotion to philosophy, and the practice of arts not understood by the people, especially by persons suspected of heresy, were made the foundation of social persecutions and legal executions for witchcraft.

Roger Bacon, in the thirteenth century, was charged with witchcraft on account of his scientific attainments, denounced by name by the Pope, and several times imprisoned. From time to time trials for witchcraft are recorded in Roman history. In the fourth century ecclesiastical decrees against it were made, and at various periods prosecutions took place under them. The whole of Europe was filled with the superstition.

The early Christian laws partake largely of the nature and of the spirit of the enactments of the same races when in paganism. The Ostrogoths punished it with death; the Visigoths with stripes, shaving the head, and exposure. The pagan Saxons burned witches and sorcerers, and even ate them. The Anglo-Saxons placed them under penalty of death; the ancient law of Scotland burned them at the stake. In Hungary they were first handed over to the bishop, then branded on the forehead, neck, and back in the form of a cross.

The charge of witchcraft was frequently used against societies, such as the Templars, from 1307 to 1313. It was on this charge that Joan of Arc was burned to death. In 1429 by means of it the Stedinger, who had fought for nearly thirty years against the Archbishop of Bremen and the Count of Oldenburg, were with the help of the Pope suppressed.

In 1488 Pope Innocent VIII. issued a bull establishing commissions of inquisitors, and succeeding popes appointed other commissions. Sometimes the suspects were accused of

heresy aggravated by witchcraft, and again of witchcraft leading to heresy. But witchcraft was the charge that especially inflamed the populace, and was pursued with the greatest zeal by the inquisitors. The epidemic raged in France so that by the end of 1320 fires for the execution of witches blazed in nearly every town. The more fires the more witches, accusations, and trials; so that the priests began to despair, wondering how it could be explained that it was impossible to commit "so great a number of the Devil's slaves to the flames, but that there shall arise from their ashes a sufficient number to supply their places." Seldom were there any acquittals.

Luther and the reformers believed as firmly in the existence of witchcraft as the Roman Catholics, though the latter charged that the Hussites in Bohemia, and the followers of Luther, deceived the people by magic and witchcraft. A Jesuit theological professor declared that Albert of Brandenburg was the king of wizards, a famous magician who laid waste the country with fire and sword. The same Jesuit affirmed that wherever the heresy of Calvin went in England, Wales, or Ireland, the "black and diabolical arts of necromancy kept pace with it." Professor Charlton T. Lewis, in his history of Germany, says, "Protestants and Catholics alike carried on their judicial barbarities, which desolated whole tracts of country. Neither age, sex, nor rank was a protection against this persecution. Counselors and scholars were sent to the stake, though women were the especial objects of vengeance; and the trials did not end until the reign of Frederick the Great."

In England laws, both ecclesiastical and civil, were enacted against witchcraft. Various changes were made in the phraseology of the law down to the time of Elizabeth, when sorceries, enchantments, charms, and witchcraft were made punishable with death when death ensued from their practice; in other cases, for a first offense, a year's imprisonment, and for a second, death. James I. was not satisfied with any previous act, as he was "an expert and specialist in the matter." In his time a law was passed making various distinctions. In Scotland similar acts were passed, the chief of them dating from 1563. In Ireland trials took place as early as 1324 in ecclesiastical courts.

THE PROBLEM.

The history of witchcraft exhibits features common to all forms of mental and moral contagion, and its characteristics are similar everywhere; so that the study of its phenomena in New England, where the information is full, the date recent, and the habits, language, re-

ligion, and institutions analogous to those of all English-speaking races, will have special advantages.

The first settlers of New England brought across the Atlantic the sentiments which had been formed in their minds in Great Britain and on the Continent, as well as the tendencies which were the common heritage of such an ancestry. They were a very religious, and also a credulous people; having few books, no papers, little news, and virtually no science; removed by thousands of miles and months of time from Old-World civilization; living in the midst of an untamed wilderness, contending against a climate unlike anything they had experienced, surrounded by Indians whom they believed to be under the control of the devil, and whose medicine-men and soothsayers they accounted wizards. Such a mental and moral soil was adapted to the growth of witchcraft, and to create an invincible determination to inflict the punishments pronounced against it in the Old Testament; but the coöperation of various exciting causes was necessary to a general agitation and a real epidemic.

Samuel G. Drake's "*Annals of Witchcraft in New England and Elsewhere in the United States, from their first Settlement*," which I here epitomize, enables us to trace the sporadic manifestations of witchcraft step by step to the fearful explosion of 1692. The Pilgrims landed in Plymouth in 1620. In 1636 they included in the summary of offenses "lyable to death," "the solemn compaction or conversing with the Divell by the way of Witchcraft, conjuration, or the like." The colony of Massachusetts adopted the Body of Liberties, which contains a similar clause. In 1642 Connecticut included this in its Capital Code: "Yf any Man or Woman be a witch, that is, hath or comforteth with a Familiar Spirit, they shall be put to death."

It is believed that the first actual trouble from witchcraft occurred in New Haven, and the first execution was in 1646 in Hartford. In 1647 Rhode Island made the penalty "Felone of Death."

The first execution for witchcraft in the colony of Massachusetts Bay was that of Mrs. Jones in Boston in 1648. Another woman was executed in Hartford in 1648.

From the settlement of Springfield in 1636 there was more or less trouble about witchcraft.

Mrs. Knapp suffered death in the New Haven colony in 1653. The troubles continued through 1654 and 1655. In 1656 Mrs. Ann Hibbens was executed in Boston. In the same year there was a trial at Portsmouth, but no conviction. In East Hampton, Long Island, in 1657, Mrs. Garlicke was tried for witchcraft.

There were troubles in 1659 at Saybrook,

Connecticut, and Andover, Massachusetts. In 1660 at Scituate, Plymouth, and at Oyster Bay, Long Island, there were disturbances, but no convictions. In 1662 Mr. and Mrs. Green Smith were executed at Hartford, and in 1665 the Court of Sessions in the State of New York tried Ralph Hall and his wife Mary. They were finally acquitted after three years' imprisonment. In 1669 Susannah Martin was prosecuted. She was one of those afterward executed at Salem. Catharine Harrison of Wethersfield was convicted, but the special court reversed the decision.

Mrs. Mary Parsons, of the highest social standing in Northampton, was charged with witchcraft in 1674, kept in prison several months, and acquitted. At that time three of the most enlightened men of the age, Governor Leverett and Generals Gookin and Denison, had charge of the administration.

In 1675 a queerly worded law was enacted to regulate the Pequot Indians: "Whosoever shall Powau or vse Witchcraft, or any Worship of the Devill, or any fals Gods, shall be convicted punished."

In 1681 and 1682 in Massachusetts there was much excitement, and cases arose in 1683 which show a descent to the lowest depths of barbaric superstition. In 1684 Margaret Matson was tried in Delaware County, Pennsylvania, before William Penn. Philadelphia was then only three years old. The court brought in the verdict that she was "guilty of having the common fame of a witch, but not guilty in manner and form as she stands indicted." Tradition says that Penn said to her "Art thou a witch?" and "Hast thou ridden through the air on a broomstick?" When she answered yes, he said that she had a right to ride on a broomstick, that he knew no law against it, and thereupon ordered her discharge.

In 1685 Mary Webster, who had been acquitted in Boston in 1683, was accused of killing William Smith by sorcery. She was acquitted, but harassed by the people and often mobbed until her death in 1696. The famous case of the Goodwin children in Boston occurred in 1688. Mary Randall was arrested in Springfield in 1691, and kept in jail for a while, but there was no trial.

Thus it appears that, from the settlement of New England, wherever unaccountable events took place,—if horses and cattle were sick in an unusual manner or acted strangely; if adults or children were attacked by incurable or mysterious diseases; if lightning struck men, animals, or buildings, or storms disturbed sailors,—the cause was attributed to witchcraft. Under such circumstances any woman who had incurred the animosity of neighbors, especially if she had made threats against "afflicted" per-

sons, was liable to the suspicion of complicity with the devil. But as there had been only two or three executions at most in any one part of the country, and intelligence of the trials spread slowly, no great excitement arose until 1692.

In view of the preceding history, the events in Salem, Salem Village, and vicinity might have been expected in any community in New England where many social feuds existed, and where strong superstition, great energy, and force of will, with an entire want of discretion, were united in the character of the minister of the parish. All these conditions existed in Salem Village, where the epidemic originated.

Upham, in "Salem Witchcraft," has portrayed in a masterly and convincing manner the influence of local feuds upon the investigation of charges. But if the people of New England had not believed in the reality of witchcraft, and if their laws had not decreed the penalty of death, personal, social, and ecclesiastical animosities could not have caused such terrible deeds.

Salem witchcraft thus arose: The Rev. Mr. Parris, minister of the church in Salem Village, had formerly lived in the West Indies, and brought some negro slaves back with him. These slaves talked with the children of the neighborhood, some of whom could not read, while the others had but little to read. In the winter of 1691-92 they formed a kind of circle which met at Mr. Parris's house, probably unknown to him, to practise palmistry and fortune-telling, and learn what they could of magic and necromancy. This circle consisted of two or three negro slaves; Elizabeth, daughter of Mr. Parris, aged nine; his niece Abigail Williams, eleven; Ann Putnam, twelve (Upham says that the last-named was the leading agent in all the mischief that followed); Mary Walcot, seventeen; Mercy Lewis, seventeen (she was one of the worst, and fairly reveled in murder and misery); Elizabeth Hubbard, seventeen (almost as bad); Elizabeth Booth and Susannah Sheldon, each eighteen; and two servants, Mary Warren and Sarah Churchill, each twenty years of age. These servants hated the families of John Proctor and George Jacobs, with whom they lived. Besides these there were three married women, one the mother of Ann Putnam.

Before the winter was over some of them fully believed that they were under the influence of spirits. Epidemic hysteria arose; physicians could not explain their state; the cry was raised that they were bewitched; and some began to make charges against those whom they disliked of having bewitched them. In the end those of stronger mind among them became managers and plotters, directing the rest at their will. By the time public attention was attracted Mr. Parris had come to the conclu-

sion that they were bewitched, and, having a theory to maintain, encouraged and flattered them, and by his questions made even those who had not believed themselves bewitched think that they were.

From March, 1692, to May, 1693, about two hundred persons were imprisoned. Of these some escaped by the help of friends, some by bribing their jailors, a number died in prison, and one hundred and fifty were set free at the close of the excitement by the proclamation of the Governor. Nineteen were executed, namely: On July 19, Sarah Good, Sarah Wildes, Elizabeth Howe, George Jacobs, Susannah Martin (who had been tried and acquitted in Boston about twenty years before), and Rebecca Nurse; on August 19, John Proctor, Bridget Bishop, George Burroughs, minister of the gospel, Martha Carrier, and John Willard; on September 22, Martha Corey, Mary Eastey, Alice Parker, Mary Parker, Ann Pudeater, Willmet Redd, Margaret Scott, and Samuel Wardwell. Giles Corey, a man eighty years of age, when charged refused to plead, and was pressed to death—the only instance of the application of this ancient law on this continent.

When it is remembered that a number of these persons were among the most pious and amiable of the people of Salem, Salem Village, and other parts of Essex County; that they were related by blood, marriage, friendship, and Christian fellowship to many of those who cried out against them, both as accusers and supporters of the prosecutions, the transaction must be classed among the darkest in human history.

DOES THE BIBLE TEACH THE REALITY OF WITCHCRAFT?

SIR MATTHEW HALE, in his "Trial of Witches," 1661, basing the conclusion upon the Scriptures, affirms that there is a real supernatural operation of the devil at the request of a witch. John Wesley, who was born only twelve years after the scenes in Salem, wrote in May, 1768: "They well know [meaning infidels, materialists, and deists]—whether Christians know it or not—that the giving up of witchcraft is in effect giving up the Bible." In a letter to his brother, written some years afterward, he declares that he believes all Cotton Mather's stories. His opinions upon these subjects were those of the age, but did not convince his brother Charles, who frequently expostulated with him for his credulity. With the same spirit and in the same way he affirmed it a giving up of the Bible to question various ideas now rejected by the most devout Christians, and did himself repudiate in later periods of his life what in similar language he had condemned others for disbelieving.

An examination of the references to witchcraft shows that only the existence and criminality of the *attempt* to practise it are to be concluded from the words of the Scriptures. The conclusion is not well founded that if there were no reality in witchcraft the prophets and apostles must necessarily have known it; for the Scriptures show that the prophets were limited in knowledge upon a variety of points, many of them closely allied to the religious truths which they taught. They drew illustrations from supposed facts of science, medicine, and natural history, which served their purpose for the time; and in *such particulars* wrote exactly as authors of to-day, who find their illustrations in the state of knowledge in the age in which they live. Moses declares that "the man or the woman who hath a familiar spirit, or is a wizard, shall be put to death"; and "thou shalt not suffer a witch [Rev. Ver. *a sorceress*] to live." It is clear that the same law would be needed and the same language would be employed if the *pretense* of having a familiar spirit, or the *attempt to practise* witchcraft were in question. In Deuteronomy xviii., Moses attempts to enumerate all possible forms of occult practices, when he warns the Israelites against the practices of the nations whose land the Lord had given them, condemning "divination," one that practiseth augury, or an "enchanter," or a "sorcerer," or a "charmer," or a "consulter with a familiar spirit," or a "wizard," or a "necromancer."

In the forty-seventh chapter of Isaiah, the Israelites are taunted with the multitude of their enchantments, and the multitude of their sorceries, and they are told to call upon "the astrologers, and the star-gazers, and monthly prognosticators" to save them if they can. The astrologers in this passage are "the dividers of the heavens"; the star-gazers, "the reviewers of the heavens"; the monthly prognosticators, "those who give predictions from month to month." The word translated "a consulter with familiar spirits" is from a term whose literal meaning is equivalent to that of our ordinary word ventriloquist, drawn from the fact that such persons chirp, mutter, speak as one from the ground, or from the abdomen. The only place where the word "witchcraft" occurs in the Revised Version of the New Testament is Galatians v., 20, where among the works of the flesh are named "idolatry and witchcraft." Witchcraft is there translated from *φαρμακεία*, signifying "enchanters with drugs."

The laws of Moses and the maledictions of the prophets show an attempt to prohibit, punish, and extirpate the whole host of occult practices of Egypt, Babylon, and Media, Persia, Phœnicia, and every other nation with which the Israelites came in contact. The theocratic nature

of the government of God as set forth by Moses could not allow any rival; the attempt was rebellion and treason, the punishment death.

Against the conclusion which we draw that the attempt, and the attempt only, was to be considered in the trial of a case, it is said, "How, then, could an Israelitish judge decide the case of a person arraigned under this law? Would not the whole issue of the case depend upon the proof that the accused really had an attendant spirit? And is not the law an express declaration, not merely of the possibility, but also of the actual occurrence of such connections?" Not at all. Unless the Israelite judges had the power of supernatural perception, the only thing that they could take cognizance of would be the *attempt*.

Those who reject this conclusion, if they would be consistent, must believe all the forms of imposture comprehended in the common law of Israel to be supernatural; they must believe in astrology, augury, and charms; and that the heathen gods were actual supernatural devils. St. Paul says, "We know that no idol is anything in the world"; and though when warning the people to flee from idolatry, he says that "the things which the Gentiles sacrifice they sacrifice to *devils* and not to God," it is a strained and long-drawn inference that he means to say that beyond the heathen gods there are real demons which they worship. If that were so the prophet Jeremiah was deceived himself, and deceived the people when he said, "Be not afraid of them [the heathen gods]; for they cannot do evil, neither is it in them to do good."

THE WITCH OF ENDOR.

THE case of the Witch of Endor is the only instance in the Bible where a description of the processes and results is given. Whether any one appeared to the witch, and if so who it was, has caused endless debate. Lange gives a summary of the different views. The Septuagint and the Apocrypha represent that it was Samuel, and Justin Martyr held the same; Tertullian that it was a *pythoness*, exclaiming, "Far be it from us to believe that the soul of any saint, much less a prophet, can be drawn forth by a demon"; Theodoret, Justin, Origen, Ambrose, Augustine, and some Jewish rabbis held that the "appearance of Samuel" was produced by God's power; and Delitzsch, Hengstenberg, and other moderns support it. Luther held that it was "the Devil's ghost"; Calvin that "it was not the real Samuel, but a spectre." Grotius thought that it was a deceptive spirit.

Amid the conflict I also will show "mine opinion." Saul, who was a man of strong pas-

sions, feeble judgment, and little self-control, had sinned, and God refused to hear him. With the Philistines visible at a distance of four miles, encamped in a better position than his own, being forsaken by God, his heart sank within him, and he determined to know the worst. Taking his servants into his confidence, he sought out a professed witch, or necromancer. After getting an oath that she would not be punished, she began in her usual way. "Whom shall I bring up unto thee?" This was her professed business. "Bring me up Samuel!" Immediately afterward the woman cried with a loud voice, and said to Saul, "Why hast thou deceived me, for thou art Saul?" There is a strong presumption that she would have known him under any circumstances. He was "head and shoulders above all the people"; his face must have been familiar; his camp was less than twelve miles from her cave. It is incredible in that small country, with Saul ranging over it, and great public processions, that the witch had never seen him. Said he, "Be not afraid." She said, "I see gods ascending out of the earth." "What form is he of?" "An old man covered with a mantle." Then Saul, who never saw anything, but depended upon her description, "perceived that it was Samuel."

What such women did in those times they are doing now in the East. She had retired—her cave, according to the Oriental custom, being divided by a curtain—and had been performing her incantations and muttering. It has often been remarked that when such a giant as Saul appeared and said, "Bring me up Samuel," the witch must have been indeed a foolish woman not to suspect who he was that made such a strange request. Before Samuel is represented as speaking she knew that her interlocutor was Saul. Her motive for pretending not to know him at first was to increase her influence over his mind—a common resort of such performers.

In Saul's address to Samuel, before the witch gave the alleged answer, he had given her all the facts that she needed to form that answer. "I am sore distressed, for the Philistines make war against me, and God is departed from me, and answereth me no more, neither by prophets nor by dreams: therefore I have called thee, that thou mayest make known unto me what I shall do."

The answer plainly consists of things which Samuel had said while living, and of things that could be conjectured from the situation. It is not necessary to assume that the woman was wholly a deceiver. Possibly she believed that her incantations brought up the dead, and she may have been wrought up into a species of trance in which she imagined the character suggested by her applicant. If so, she would

naturally personify the tone of another person, and would speak to a great degree in harmony with what the character might be expected to say under the known circumstances. The narrator, as certain ancient Church decrees, according to Reginald Scot, declare, "set forth Saule's mind and Samuel's estate and certeine things which were said and scene, omitting whether they were true or false."

TRIAL OF CASES.

LITTLE aid in the understanding of the trials of witches in New England in 1692 can be derived from courts as now conducted. The Honorable William Sullivan, in an address before the Bar of Suffolk, Massachusetts, in March, 1824, says that in Massachusetts the governor and assistants were the only depositaries of power, exercising legislative, judicial, and executive authority. They inferred from the charter the rights to exercise whatever power the welfare of the community required; when that was silent the Scriptures were the resort, the clergy and the elders being the expounders in all new emergencies. Hutchinson says that for a number of years "the jury, if not satisfied with the opinion of the court, were allowed to consult any bystander." For several years there were no lawyers, though there were a few attorneys, in the country. According to Mr. Sullivan, the importation in 1647 of two copies each of several law-books, including "Coke on Lyttleton," "Magna Charta," and "Coke's Reports," was probably the first introduction of the common law into the colony. Few or none of the judges were professional lawyers.

On the 8th of December, 1885, the Honorable William D. Northend delivered an address before the Bar of Sussex County, which is to be found in the twenty-second volume of the "Historical Collections of the Sussex Institute." His estimate of the judges is that there was not a regularly educated lawyer on the Superior Court Bench of Massachusetts until 1712, long after the witch trials were over. At that time, and for many years afterward, counsel were not assigned or allowed in capital cases, except on questions of law when the court was in doubt, the theory being that the judges were counsel for the prisoner. On May 14, 1692, Sir William Phipps arrived, bringing the new charter. He was a weak man and a believer in witchcraft. One of the first things he did officially was to appoint seven persons of Oyer and Terminer to try the prisoners who had been committed under suspicion of witchcraft in Essex County.

The kind of evidence admitted appears from the records, which are now accessible. One

case may serve to illustrate all. Against Rebecca Nurse there were four indictments. The first sets forth that "she has afflicted Ann Puttnam, Jr., by certain detestable arts called witchcraft, and sorceries, wherewith she has hurt, tortured, afflicted, wasted, and tormented."¹ The other indictments use nearly the same language.

Mrs. Nurse was an aged woman of unspotted reputation, and was more tenderly treated during a portion of the time than any of the rest. The jury at first acquitted her, but the judges sent them out again, and practically forced them to bring in a verdict of guilty, notwithstanding Mrs. Nurse's assertion that she had failed to answer a question (which failure was used against her) because, being deaf, she did not hear it. The judges appeared to be convinced of the guilt of all from the time the afflicted declared them guilty, and badgered prisoners in a manner almost incredible. Most of the examinations were written down by the Rev. Samuel Parris; one of the strongest proofs of the utter blindness of the times being the frank and unequivocal manner in which the record is prepared.

The prejudices of the judges and the spirit in which they dealt with the defendants appear from the account of the examination of Elizabeth Cary, of Charlestown, given by her husband, Captain Cary, a shipmaster.

His wife, being conscious of innocence, went to the church. The girls came in, fell in fits, and cried out, "Cary! Cary!" Mrs. Cary had never seen nor heard of one of them in her life. As at every motion of the defendant the afflicted made the same, Mrs. Cary was ordered to stand with her arms stretched out. Mr. Cary says, "I requested that I might hold one of her hands, but it was denied me; then she desired me to wipe the tears from her eyes and the sweat from her face, which I did; then she desired that she might lean herself on me, saying she should faint. Justice Hathorne replied, 'She had strength enough to torment these persons, and she should have strength enough to stand.' I speaking something against their cruel proceedings, they commanded me to be silent or else I should be turned out of the room."

Mrs. Cary was committed, but escaped from jail, went to Rhode Island, and finally to New York, where the governor of the State interested himself in her and protected her. Captain Cary, after describing her sufferings, says: "To speak of their usage of the prisoners, and the inhumanity shown to them at the time of their execution, no sober Christian could bear."

No testimony as to previous good conduct and character availed anything. This may be illustrated by the case of a woman of whom

the Rev. William Hubbard, one of the most honored ministers in New England, characterized by Hutchinson as "a man of learning, and a logical and benevolent mind, accompanied with a good degree of catholicism," certifies:

I have known the wife of William Buckley of Salem Village, . . . ever since she was brought out of England, which is above fifty years ago. . . . She was bred by Christian parents, . . . was admitted as a member into the Church at Ipswich (of which he was the pastor) above forty years since. I never heard from others, or observed by myself, anything of her which was inconsistent with her profession, or unsuitable to Christianity.

But on evidence similar to that which convicted the others, and mostly from the same witnesses, she was hurried off to prison.

John Proctor went with his wife to support her under the charges; the "afflicted" cried out against him, and though many of the citizens testified as to his good character, as well as to hers, he was executed. But the children cried out that they could see "his shape afflicting them."

Against George Burroughs, a graduate of Harvard College and former minister of Salem, the principal evidence was that though a puny man he was remarkably strong physically; that he made nothing of carrying barrels of sugar, flour, etc., from one place to another, and that he could hold a gun straight out at arm's-length by taking hold of the end of the stock; that his wife told some one that he said "he knew all secrets, and made her promise to reveal none of his"; and that he accused his brother-in-law and his wife of talking about him on one occasion.

In his address Judge Northend remarks, "No better illustration can be given of the fallacy of the views of those who look upon legal rules as only a clog and hindrance in the administration of justice. Under the rules of laws now fully established, none of the evidence upon which the convictions were found would be admitted; spectral and kindred evidence could not be allowed, and without it not one of the accused could have been convicted."

EXPLANATION OF CONFESSIONS.

MANY persons acknowledged themselves witches, both in Europe and America, and gave detailed accounts of their interviews with the devil. This has led various writers to suppose that witchcraft has an objective reality; and certainly the problem is complicated by the fact that some of those who confessed were persons of undoubted piety. Yet it is not difficult of explanation.

In Europe tortures of the most terrible character were resorted to to compel confession. In his "Superstition and Force," Mr. Henry C. Lea quotes Rickens, a magistrate during an

¹ From the "Records of Salem Witchcraft," copied from the original documents, and privately printed for W. Elliott Woodward. Volume I.

epidemic of witchcraft at the close of the seventeenth century, as complaining that no reliance could be placed on legal witnesses to procure conviction. Del Rio avers that torture is to be more readily resorted to in witchcraft than in other crimes, in consequence of the *extreme difficulty of its proof*. This, Mr. Lea says, was the common opinion of the time. Constantine issued a decree in 358 A. D. that no dignity of birth or station should protect those accused of sorcery or magic from the severest application of torture. Old German records are full of accounts of men and women yielding and confessing, usually in language put into their mouths by the inquisitors.

In New England *none* of those who confessed themselves witches were executed, and every effort was made to induce them to do so. If any one confessed to being a witch, and afterward, driven by conscience, retracted, he was certain to be executed. This was the case with Samuel Wardwell, who confessed, retracted his confession, and died upon the gallows protesting his innocence.

But why did some religious and spiritually minded persons confess? Because they were saturated with erroneous views of the power of the devil, and his mode of exercising it. They believed that he was very near them all the time, endeavoring to effect an entrance; and when they were accused and saw "the afflicted," and realized that the magistrates and ministers thought they were guilty, their minds being weakened by the terrible pressure upon them, they came to the conclusion that in some unguarded moment the devil had gained an advantage over them; and that, though "they were unconscious of having done such things, their *spirits* must have committed them," and they therefore confessed.

Many thousands of persons in former centuries concluded in the same manner that they had committed "the unpardonable sin"; while of these very few had any clear idea of what the sin is. The pressure of the doctrinal beliefs of the age upon morbid conscientiousness, with a natural distrust, antagonized all the promises of the Gospel, and they despaired.

Many abandoned persons who believed in witchcraft and sought to obtain the power could easily find coincidences seeming to prove the truth of their claims, and in this way thought themselves to be wizards and witches.

EXPLANATION OF PHENOMENA.

In the progress of science principles have been established and illustrative facts accumulated whereby the greater part of the authentic phenomena can be fully explained. There was a large amount of fraud and jugglery.

Dr. Hutchinson of England, the second edition of whose work appeared in 1720, has a chapter on "Seven Notorious Impostures Detected."

Seventy-eight years after the Salem witchcrafts, at Littleton, Middlesex County, Massachusetts, a case involving three children whose performances were fully as remarkable and mysterious as those of the Goodwin children attracted great attention. But several years later the oldest girl offered herself as a candidate at the Rev. Mr. Terrell's church in Medford. "Her experience was considered satisfactory, but the minister chancing to preach against *liars*" (though he had not the least idea that she was an impostor), his sermon so powerfully affected her that she went to him and confessed the whole imposture, and showed how her sisters were drawn into it, "by love of mischief, imitation, vanity, and *necessity of going on after they had begun*." In the case of "the afflicted girls" of New England there is positive evidence that some were consciously and intentionally performing a part. Their conduct needs no explanation.

If those who were not performing a part believed that they were afflicted by the accused, their evidence and actions become simple. If the accused moved her head, they would move theirs automatically. The hypnotic performances, now well known, furnish a perfect analogy. Every hypnotizer has to be constantly on his guard lest all with whom he is experimenting should do whatever is done by one. That this is an adequate explanation appears from the fact that in those parts of the world where witchcraft is still believed in, and where a scientific knowledge of epidemic hysteria and of hypnotism does not exist, such attacks are believed to be produced by witchcraft.

The "London Medical Record" has recently published an article quoted from an Italian medical journal, giving an account of an epidemic of hysteria among the peasants of Albania. The priests had tried to exorcise the evil spirits, but without success. Fourteen girls under twenty years of age, one boy of eleven, a woman of fifty, and a robust peasant of nineteen were carefully studied. The muscles of the face and neck became rigid, and afterward those of the limbs. The woman went through the most violent contortions and muscular motions, beating her chest with her hands and then falling motionless. This was sometimes repeated again and again. She said that during the attacks she "saw the figure of the woman who bewitched her." The origin and history of the case are here given in brief:

A band of seventy girls had agreed to work for an old woman in rice-fields. Thinking that they could make a better bargain, they broke their

engagement. The old woman was angry, and as she was generally supposed to possess the power of witchcraft, the girls were constantly in dread of being bewitched. As they worked eleven hours a day, standing in water in the hot sun, living chiefly on unsalable beans, bad bacon, and decaying rice, they were reduced "to a state of very unstable mental equilibrium, which was completely upset by seeing the hystero-epileptic fits of the first patient." The medical men sent them off to their own homes, thus isolating them, and they were speedily cured.

The imitative principle in such cases sometimes goes so far that what one thinks he sees hundreds will think they see; what one does scores and hundreds will do. The precise manner of dissemination of the dominant idea is well known.

Testimony to marvels of a different kind is occasionally introduced, such as mysterious noises, the fastening of doors, overthrowing of chairs, tables, crockery, the extinguishing of lights without apparent cause, the entrance of hogs and other animals into a house, the appearance of lights the origin of which is not understood. A case of this kind occurred in New England in 1680, and was before the courts at Ipswich. William Morse and his wife, with whom in the house no one but a grandson lived, were disturbed by such occurrences. A neighbor, Caleb Powell, looked into the matter, and declared that the boy played the tricks; that he had seen him fling things at his grandfather's head while the old gentleman was at prayer. But the mere attempt to explain the mystery nearly cost Caleb Powell his life, for he was arrested on suspicion of witchcraft, and many witnesses were brought to swear that he said that by astronomy and astrology he could find out, as he "knew the working of spirits, some in one country and some in another." Little investigation could take place in any country where the investigator was liable to be accused of witchcraft and to lose his life for denying the reality of it.

Scientific investigation, with the meaning which is now given to these words, was never applied to the phenomena. Drake does not exaggerate when he declares that, during the period, "if anything occurred, the origin or reason of which was neither understood nor comprehended, and appeared stranger than usual, the mind instead of investigating fell back upon the ever-ready and easy solution that such was caused by witchcraft." There were, of course, a few doubters; but they seldom obtained access to primary sources of information, and when they did were denounced as "Sadducees," "defenders of witches," or "agents of the devil." So strong was this influence that certain clergymen, who

plainly did not approve the proceedings, were compelled to reaffirm continually their belief in witchcraft, and to protest against being considered defenders of witches. If persons became aggressive in the defense of the accused they were cried out upon by the accusers, and a mortal terror of the consequences led many to avoid being present at the investigation.

Electricity, magnetism, and the action of gases, as well as meteorological phenomena, were imperfectly understood in the times of the epidemic of witchcraft. Many mysteries then inscrutable could now be easily explained. The science of bacteriology, a discovery of the present generation, illustrates many of the facts which, being misunderstood, were supposed to indicate the presence of the devil, and to be the results of witchcraft. Dr. Prudden's "Story of the Bacteria, and their Relations to Health and Disease" gives many instances, and a circumstance easily explained recently occurred which two hundred years ago might have been the means of the death of many persons. Some time since there was brought to the physiological and pathological laboratory of the Alumni Association of the College of Physicians and Surgeons of the City of New York for examination "a cluster of sausages which had been destined to grace a boarding-house breakfast-table. To the consternation of the maid who went into the dark cellar for them in the early morning, there hung in the place of the sausages a fiery effigy, which seemed to her more like the quondam spirits of their mysterious ingredients than the unctuous, homely friend of the homeless boarder." The microscope revealed at once the bacteria which produced the effect.

REACTION FROM THE FRENZY.

A DEEP conviction of the fallibility of spectral evidence arose in the minds of many. The recollection of the characters and good deeds of several who had been executed, of their dying protestations of innocence, and their religious bearing at the place of execution, and the recognition of the fact that if they had confessed they might have saved their lives, were powerful causes of the reaction.

But there were two others of still greater influence. The "afflicted" began to accuse persons of such high standing that the community instinctively felt that the charge was false. The Rev. Mr. Hale of Beverly had supported the prosecutions; but when his own wife was accused, he saw that they were going too far, and turned against them. Her case was but one of several: spiritual, devout, and consistent, she was not better than some of those to whose condemnation and execution her hus-

band had consented, upon evidence similar in all points to that alleged against her. But they were without such social relations as could effectually stem the tide, and were accused before a suspicion of the trustworthiness of the evidence had been engendered.

The other cause was the *retraction of the confessions*. In all fifty-five confessed. Some of them retracted, though they knew it would be certain death. Such was the case of Samuel Wardwell, who was executed protesting his innocence. Margaret Jacobs, who had testified against her grandfather in her confession, was so overwhelmed with grief and shame when she came to herself that she took it back, and addressed the court, saying :

They told me if I would not confess I should be put down into the dungeon, and would be hanged; but if I would confess I should have my life; the which did so affright me with my own vile, wicked heart, to save my life, made me make the like confession, I did, which confession, may it please the honored Court, is altogether false and untrue. The very first night after I had made confession I was in such horror of conscience that I could not sleep for fear the Devil should carry me away for telling such horrid lies.

The entire confession is one of the most touching compositions in literature. She was afterward tried and condemned to death, but escaped because her case was not disposed of until after the reaction.

Six of the women of Andover who had confessed signed a declaration retracting, and fifty of the inhabitants of that town testified to their good character. They say that their nearest and dearest relations told them that there was no hope of saving their lives but by confessing themselves to be witches; that the confession which they made was suggested by some gentlemen,

they telling us that we were witches and they knew it, and we knew it, which made us think that it was so; and our understanding, our reason, our faculties almost gone, we were not capable of judging of our condition. . . . And most of what we said was but, in fact, consenting to what they said. Some time after when we were better composed, they telling us what we had confessed, we did profess that we were innocent and ignorant of such things; and we learning that Samuel Wardwell had renounced his confession and was quickly after condemned and executed, some of us were told we were going after Wardwell.

Andover was "the first to recover its senses"; juries began to acquit; the governor of the State issued a proclamation opening the prisons, and a general fast was ordered. The jurors who had convicted the accused signed

and circulated a document confessing that, "for want of knowledge in themselves and better information from others, they had taken up with evidence which on further consideration and better information they believed was insufficient for touching the lives of any"; and they "humbly asked forgiveness of all and the surviving sufferers in special," and declared that "*according to our present minds we would none of us do such things again on such grounds for the whole world.*"

In 1697 the Rev. Mr. Hale wrote a book to show that the proceedings were erroneous. Memorials were sent and the ministers of the County of Essex presented an address to the General Court under date of July 8, 1703, expressing their belief that innocent persons had suffered, and finally the General Court, October 17, 1711, only nineteen years after the executions, and while the majority of the people were still living, reversed "the attainders of George Burroughs and others for witchcraft." This act declares that "some of the principal accusers and witnesses in these dark and severe persecutions have since discovered themselves to be persons of profligate and vicious conversation," and reversed the convictions, judgments, and attainders against all that died. The General Court reimbursed survivors and their heirs for expenses incurred. The petitions of such heirs duly proved and admitted are found in Woodward's "Records of Salem Witchcraft," and are valuable as testimony to the characters of the accused, apart from the impossible crime with which they were charged.

Judge Sewall, on the day of the general fast, arose in the old South Church in Boston and sent up to the pulpit a written confession of his error. This scene Whittier describes in the lines beginning, "Touching and sad a tale is told." To the day of his death this conscientious man set apart one day of every year for humiliation and prayer on account of the part he had taken.

The clergy of Salem and vicinity in the beginning fostered the delusion. Mr. Parris and Mr. Noyes, especially the former, must be classed with those representatives of any religion, true or false, who will stop at nothing to destroy those whose orthodoxy they doubt, or whose persons or characters they dislike.

There is evidence that many of the clergy of Massachusetts disapproved the proceedings, but because of the sentiments of the ruling civil authorities of Massachusetts they were not able to exert a restraining influence. In a petition drawn up by the opponents of Mr. Parris in Salem Village, they say that the reason they would not hold communion with him is "his declared and published sentiments referring to our molestations from the invisible

world: differing from the *opinion of the generality of orthodox ministers of this whole country.*" This was under date of April 21, 1693.

The terrible consequences of the belief forced the issue upon mind and heart; common sense and common humanity reasserted themselves. The horrid fiction was cast off; some denying the reality of witchcraft, others admitting it possible in the *abstract*, but affirming that it was impossible to prove it. As soon as the prosecutions ceased there was no further trouble. The transactions in New England exerted a great influence on the other side of the Atlantic against witchcraft, and in 1736 the English statute was repealed.

The investigation justifies the conclusion that where witchcraft is not believed in there are no cases of it; where it is believed there are many, and in proportion to the intensity of the belief. It must be remembered that medical men generally were ignorant and superstitious, and the scientific practice of the healing art unknown. The press did not exist; there was no opportunity for the kind of investigation now made by reporters, or for the free utterance of adverse opinion, or for any proper or generally circulated report of trials. If the clergy of this country generally believed in witchcraft, they could find an abundance of the kind of evidence that was admitted in 1692; and were there no press, free, active, and in-

telligent, it would be possible to originate an epidemic in a few weeks which would parallel any in the past.

The crucifixion of Christ, the cruelties of the Inquisition, the burning of Servetus, the atrocities of the first French Revolution, the hanging of witches and Quakers are but manifestations of the possible excesses of human nature when governed by false and deeply rooted ideas, when strong passions are excited, and no adequate force, either of authority or of public opinion, restrains.

The solemn words of Longfellow are true of New England's part in the universal tragedy:

Be not too swift in casting the first stone,
Nor think New England bears the guilt alone;
This sudden burst of wickedness and crime
Was but the common madness of the time,
When in all lands that lie beneath the sound
Of Sabbath bells a witch was burned or drowned.

If mankind as a whole had not been stronger than any of its passions, the race would long since have annihilated itself. Superstition and barbarism, though ostensibly expelled by modern civilization, lurk in the shadows stealthily seeking an entrance; and the united forces of reason, science, religion, law, self-interest, freedom of speech and of the press, with "eternal vigilance," are needed to prevent them from regaining a direful ascendancy.

J. M. Buckley.

A PARTING GUEST.

DEAR world, how shall I say farewell to thee
As from thy friendly house I go at last?
Let me not like an unloved wanderer be
From thy door cast.

No, I have been a little while thy guest;
Still there are light and music, down thy halls
The laughing recognition of a jest
Rises and falls.

Thou hast with love and bread my wants supplied,
And hurried on my hours in joyous flight;
But longer with thee now I cannot bide,—
I come to say good night;

But leave not other friends who need thee here,—
Give me thy hand and I am quickly gone;
Thy lamps will light me with their genial cheer
Until I meet the dawn.

Meredith Nicholson.

CHARACTERISTICS.

BY S. WEIR MITCHELL, M. D., AUTHOR OF "IN WAR TIME," ETC.

III.

I WAS now again at ease as to the future, and without occupation. A man of some thirty-six years of age, I was master of three languages, well read in a general way, and, as may have been seen, a practised and interested observer of my fellow men. Moreover, I had had the experience of a long illness, and found, therefore, renewed pleasure in outdoor life as well as in a myriad of things which are to be seen in field and wood, and air and water. Mere science had in it for me little that I liked, and it was clear to me that only in my own profession was there what I desired—a combination of ever-changing science, and its constant applications to medicine as an art.

Having no wish to increase my fortune, I took chiefly to consulting practice, declining cases at will, and was lucky enough to obtain a good hospital position.

Contented with my daily work, and the constant problems it set before intelligent curiosity, I lived at tranquil ease, my friends making for me a large part of the pleasure of life. Some of them I loved for groups of moral qualities, some for the mental food with which they stimulated me. There were others who were dear because they found something in me to like and to trust and to use, and who themselves were not in any way remarkably attractive except for having a notable capacity to love. Undoubtedly there are folks whom one loves as one does some quite useless pleasant dog. From all of which it may be clear that I had many friends. Some of them were always interesting, and this is rare—although I may as well confess here that more people have interest for me than is the case with educated men in general. Even those who are generally looked upon as commonplace often find a warm corner at the hearth-side of my heart. When friends die or drift away, I like to fill their places, and hope when life ends to find the ranks as full as in the mid-flow of existence. Mrs. Vincent says that I collect friends as a naturalist does flowers. The only rational limit I can set to an increase of the number of those whom one qualifies as friends lies in the fact that one must contribute more or less in the way of time, letters, and pleasant service. Some

need little; others insist on constancy of relation—for there are genera and species in friendship. Of one of them, Vincent, already mentioned, I should feel as sure if we were parted for half a life. He was of the rare men who have intellectual apprehensions so swift as to seem instinctive. While in some matter of social difficulty, or of tangled business, I should have slowly reasoned out my conclusion, he attained the same result apparently without effort, and yet could afterward give you his reasons. He was a man too sensitively reserved to admit many to his friendship, too silent as to his charities to be known to the world as generous. His character was indeed throughout the more beautiful for the modesty which hid its values. He was one of the few I ever knew who had the art of giving, even money, with graciousness. Also, he was master of himself, body and mind. To me he seemed the ideal of modern common sense, with ever a present possibility of chivalric action carried to the verge of the quixotic. Of this man, in company with a sculptor, now very famous, and a scholar, also of the upper rank, and already mentioned, I saw much. Among them Frederick Vincent attracted me most. While these others had attained in life all, or nearly all, of what their capabilities made possible, he alone appeared to me never to reach the success which seemed within the command of his qualities. When I came to know that it was his frail physical state which set limits to a boundless ambition, I loved him more than ever, because there was never on his part the least unmanly repining. In fact, life—active life—was only possible to him on condition that he lived with care and spent much time out of doors.

One evening we met, as was often the case, at my own rooms. Three of us being bachelors and only Vincent married, these meetings were easily and often possible.

Detained by a consultation, I came in late to find two of my three friends gathered about the blazing hickory logs of my study hearth. The third, Clayborne, was as usual wandering about, now along the coast of my bookcases, now knocking against chair or table, a great drifting hulk of a man.

"And what have you been discussing?" I said.

"We began," said Vincent, "with a long screed from St. Clair. He is laughing at Mrs. B—— for having her girls trained by a drill-

sergeant to have flat backs—like West Point cadets. He insists that no antique statue of woman is erect, and he declares that they all droop like flowers."

"It was n't a fertile text," said Clayborne, "and we soon got through with it. There is one comfort about that boy St. Clair's futilities of speech. If he talks often he does n't talk long at a time."

"Thanks," said St. Clair. "It was Clayborne who digressed; I could have gone on for an hour about the flat backs of what they call 'women' in these days. I wonder would Eve know her modern sisters. Clayborne went off for an unbroken half-hour on the ancients as realists. He thinks the Laocoon the finest thing in plastic art, old or new. He meant, I fancy, to start on that as a text, but the text got in only at the end of the sermon. Realism—I loathe the word, and he calls the Laocoon realistic."

"I do."

"What, to carve a snake as a round rope, and to give a constrictor serpent fangs? Any boy knows better than that."

"Those snakes have no fangs," returned Clayborne.

"Yes, they have," I said; "and in the upper jaw, in the right place, and one on each side."

"I don't believe it," said Clayborne.

"And still it is so," returned St. Clair. "Moreover, Clayborne, although the old sculptors were fond of carving serpents, I never saw another example of the venomous fanged snake in any art museum."

"And snakes are not round?" said Clayborne, appealing to me.

"No; a section of a snake in motion or constricting would be like a half moon, and flattened on the belly side."

"I give up," said the scholar. "I am always ready to yield to real knowledge; but—"

"Oh, come now!" cried St. Clair. "When you do eat your humble-pie don't growl because it gives you a mental colic."

"I am not sure about it yet," urged Clayborne. "However, we got off next on to weariness, or rather fatigue of mind. Vincent happened to say that his head was tired—his brain, I mean. St. Clair and I can't understand what that means. We do agree now and then."

"Then," said St. Clair, "we remembered what some one has said, that scholars who have lived much in Europe believe work to be possible there at less cost to one's nervous system than in our climate."

"I said that was absurd," said Clayborne. "So much thought, so much product, so much tissue wasted."

"Try to climb in our summer climate, and on a Swiss mountain," returned Vincent, "and see

whether or not more effort is needed here. It seems to me that the same may be true as to the use of the mind."

"I think that a fair reply," I said. "But also, to generalize, I fancy that any given thousand Americans do more work in a year than as many of a like group of English, we may say."

"As to this whole question," said Clayborne, "I am a bad witness. I cannot understand what a man means when he says his brain is tired."

"You must have strained it badly to know," I returned. "Sense of fatigue as referred to the brain, and not merely to eye, hand, or back, is hardly a normal sensation."

"I wonder is it wholly modern," remarked Vincent; "and did we Yankees really invent neurasthenia?"

"If I had Sydenham here," I replied, "I would show you what that master in medicine said of overwork, and the consequences, in Charles II.'s time. While I am sure we have only too many breakdowns from excesses in work, and above all from anxiety with work, I know well enough that since we discovered, described, and named the condition of nervous exhaustion it has been found to exist everywhere in Europe."

"And the remedy?" said St. Clair, who had merely listened.

"Turn beast," cried Clayborne. "Who ever saw a horse with neurasthenia?"

"Go back to nature, I suppose," said St. Clair. "Live out of doors. Turn cowboy. Get near the soil again. Imagine a neurasthenic Sioux chief."

"The remedy would destroy me," said Clayborne. "I once camped out with Owen. Never was man so wretched. My own remedy would be change of occupation for a time. Some hobby is valuable. If I weary of my work I simply go and fuss over my coins. There is Vincent; why doesn't he write a play when he is tired, or hunt butterflies?"

Vincent smiled, but made no reply. I well knew why. His fund of physical energy barely sufficed for the week's work, and left him no available reserve.

"Once," I said, "a lawyer or a doctor could not afford to go against the public opinion which decreed that he could not be anything else but mere lawyer or doctor. Now, in our great towns at least, these limitations are passing away. We have more freedom, and certainly what Clayborne says is true: one can't run away always, and a little canter on a hobby of literature, science, or art is usually possible."

"What is too often wanting to the tired man," said Vincent, quite sadly, "is the energy to saddle and bridle and mount his hobby. Rest is what I want. I stay in bed of a Sunday."

"It is rather odd," said St. Clair, who was apt to be discursive, "that in literature the doctor so often appears. There are Rabelais, Keats, Goldsmith, Holmes, Akenside, and more, if one chose to think them over. But among notable poets who have had legal training one recalls only Goethe."

"I think that is true," remarked Clayborne, who, as was common with him, was still moving about, and now and then glancing at a book on my shelves.

"But no great poet," urged St. Clair, "ever could be long or seriously anything else. None of those men continued to be doctors. Akenside one need hardly consider. Poetry is an inexorable mistress."

"I have often wondered," said Vincent, "what forms of pursuit give on the whole the largest bounty in the way of happiness."

"The naturalist's, I should say," I returned.

"The artist's," cried St. Clair. "I am supremely happy."

"And you?" said Clayborne to me.

"My life contents me," I said. "Yes; I am happy in my work. It admits of so much intellectual variety, and there is too the persistent daily work which, like a great fly-wheel, steadies all the machinery of life."

"I wish," said Vincent, "I could get inside of any other man's life."

"It would not explain or make easier your own life," said Clayborne. "After all, joyousness is a question of temperament. But, over and above that, there is something to be said as to the pleasurable quality of men's pursuits."

"Are poets happy as a rule?"

"No," returned St. Clair; "they are the very bondsmen of common sense, and that is always unpleasant in its influence. They see too clearly to be happy, and feel too acutely."

"Stuff!" cried Clayborne. "The rule would work both ways. The trouble is that most of them were fools and suffered for their non-sense. The best of brains cannot always shut the door on folly. If a man enjoys nature too much to go indoors when it rains—morally or physically rains—need he growl at the consequences?"

"And yet the notion," I returned, "that poets, artists, and men of science are wanting in every-day common business sense appears to me negated by the lives of many. Really, the great poets and foremost men of science are always variously capable. They fail in business matters merely because they care more for other things. Whenever they have been forced to conduct affairs they have shown no want of capacity. There is Goethe again, and Shakspeare, and Emerson, and in science the noble list of men who have managed the vast Smithsonian business."

"How we drift in our talk," said Clayborne. "I think you may be correct. But let me go back and recall the talk to—"

"Recall it!" interrupted Vincent. "You can't anchor a conversation. It is only when it drifts that I like it. Your serious talkers are too tiresome. How very few good things they say. How often they must re-say them. Look at any table-talk, even Coleridge's. Imagine these things said to you gravely. Nobody talks that way now; no one should. Think of the long, dull fuses that fizzed gently between their brilliant firecrackers. These professors of conversation are things of the past. As a rule, for good talk, you must have people used to talk and to listen. They must want to amuse and be amused. You can't have good talk without good manners. For my part, I would rather take my chance at table beside some woman of the world than beside most of the literary or scientific folks I have known."

There was silence for a moment while St. Clair rose and filled a pipe, saying as he dropped the match, "That is the reason why the forests are so agreeable."

"If you want to destroy conversation toss a conundrum into it," cried Clayborne. He detested lack of clearness in verse, prose, or the talk of man.

St. Clair started up. "And you call that a conundrum? Do you know any one with the breeding or manners of a pine tree; and who talks better?"

Vincent looked up at our poet-sculptor with a smile which for a certain dignity and sweetness I never saw the like of. "My manners are better and my talk more amusing," he cried, laughing. "What stuff is all this modern nonsense about the relation of man to nature! It is all manufacture, all conventional. I love the pleasant noises of trees, and wind, and waters. I like them as a child likes music—in a vague way.

I am it, and it is me,
Earth and water, air and sea;
I am them, and they are me.
In my soul the poplar shivers,
In my heart the ash tree quivers,
And a philosophical search
Readeth anguish in the birch.

We all laughed and laughed again, except St. Clair.

"Does it seem to you really so absurd," he said, "that the man and the tree should have mysterious relationships? Once they were both atoms somewhere in the slime of what you call chaos." Our friend was just now wildly, delightedly puzzled over the theories of evolution. "This unity of original product explains to me a good deal," he added.

"Does it?" said Vincent.

The sun and moon shall fall a-main
Like sower's seeds into his brain,
There quickened, to be born again.

St. Clair was now really vexed. He had a keen sense of humor, but also a childlike sense of annoyance when it was used against him. "It is easy," he cried, "to spoil a man's dreams, to bruise his ideals."

"Oh," exclaimed Vincent, "that is true, and you may be right. The relation of nature and its voices to man—not to all men—may be like the relations of music to some. I say it as a verity because I have no such relation to music. I have seen my wife with tears in her eyes, or light of joy in her face, when L—— played Beethoven. It was a closed door to me. I sat and wondered at her passionate pleasure. It was to me as are to you the murmurs of brooks, the wind in the pines. I marvel at it. I am like the beggar on the door-step. I see the house lighted up; I hear merriment within. It is not of my world; I gather up my rags, and go on."

"There is no real music in nature," said Clayborne; "really none, and rhythm too is of purely human begetting. Emerson guesses at the heart-pulse as its origin. Holmes says the easier rimes are born of the accidental length of respiration."

"Do you suppose," said I, "that verse is ever a birth-gift? Music may be, as it seems to me. Some idiots can sing distinctly. I wonder if many of the great poets had in very early childhood the tendency to rime or to speak rhythmically. Apart from its intellectual aspects, poetry does seem to me like a distinct means of expression, almost a distinct language, easy for some, impossible for others."

"There is the puzzle," said Vincent. "You can't separate the form-power from the informing intellectual capacity in poetry. The greatest poets are always the greatest masters of verse; the lesser ones may be melodious, but are never capable of the higher music of verse. The architects of thought are the master builders. Then, too, it is a curiously dominative temperament. I never shall believe there was ever a 'mute Milton.' Perhaps great creative musical power is as despotic in its order to the man to utter himself. What I envy either is the creative act. They must enjoy the making of a poem or a sonata with an intensity past our conception."

"And now I am out of my depth," said Clayborne.

"I think," said I, "that the pleasure of some revolutionizing discovery must be the equal of any joy which either poetic or musical creativeness affords. To know of a sudden some far-reaching law, some fact hidden in solar space, or time-buried; to come on its conception abruptly, as between two breaths—well,

I would as gladly experience that as to have written 'Comus.'"

"Not I," said St. Clair.

"Nor I," said Vincent; "but, like Clayborne, I have not imagination enough to enable me to conceive of either as possible. I am quite sure that as yet the psychical share of imagination in great material discovery has not been fully appreciated. In Goethe's scientific work it shows remarkably. The other side is seen in his poetry, and in Dante."

"How?" cried St. Clair.

"You, at least, ought to know. Talk about glory and rewards for these men of many crystalline facets, each with its light and colors. They must needs be glory and joy enough to themselves."

"It is an awful human fact," I observed, "that they all craved recognition."

"And when," returned Clayborne, "we see how little most men can do, the absence of limitations in some men of genius appears incredible. I suppose none of them equaled Da Vinci in the wonderful variety of gifts—painter, sculptor, poet, architect, hydraulic engineer, anatomist, physiologist. What a life! One marvels most at the memory of a man like that. It must have been perfect."

We all laughed; the speaker was a wonder of memorial strength. He went on, "Oh, I remember well enough; but—my last word makes me ask if there ever was a man with an absolutely perfect memory."

"That is rather droll," said I, "because I was consulted yesterday by a queer fellow who says that his memory is too good. In a day or two he is to bring me a written statement of his case. If you like I will read it to you the first time chance brings us together."

"I should like to hear it," returned Vincent. "Nothing seems to me more improbable."

As they went away, he lingered. "I wish," he said, "you would do for me as you some time ago said you would, and let me see the inside of a doctor's life. I mean as much of it as one can see. We have talked it over so often."

"That is in part possible," I returned. "Meet me to-morrow. It is Sunday. I am due at St. Ann's Hospital at eleven."

"Agreed," he said, and left me.

IV.

VINCENT was waiting for me next day in the manager's room of the hospital. I said to him, "If you are to excite no remark, look as wise as nature allows, and let me call you doctor."

He nodded, and followed me. At the head of the stairs a young resident physician met us. He carried my case-book, a stethoscope, and a percussion-hammer. The walls, like the floors, were

of exquisite cleanliness, and unornamented save by portraits of physicians who had gone their rounds for years in these wards, and at last followed their many patients out of the world.

The young doctor, a favorite of mine, opened a door, pausing a moment to say, "Joe is worse, sir."

"And Johnson?"

"Oh, better; much better."

I said to Vincent: "My young friend and I differed a little as to a case. It looks now as though he were right." The young man glanced up flushed and glad, and we went into the ward.

Here were some twenty beds, all full. Beside each was a little table, and, now, neatly tucked back, clean fly-nets, it being near to summer. The floor was of spotless boards; the walls were of a pleasant gray tone, and there was ample light, and, of course, abundant air, so that the atmosphere was without odor. Four neat, white-capped, white-aproned young women, their arms covered with protecting white over-sleeves, moved to and fro noiselessly. An older woman came up to us, smiling. I presented her to my doctor.

"I like my head nurse to make the round with me," said I. "Come, and ask what questions you please, doctor. I hope not to tire you; my Sunday visits here are long ones. Here is a case not clear to me; perhaps you can help us." Vincent preserved a perfect gravity.

"How are you, John?" I said. A great stalwart lumberman lay stretched out in bed his full six feet two.

"Look at his face," I said in an undertone.

"I am no better, sir, and I won't never be."

"A case of pneumonia, doctor, and not a bad one. He is on the way to health: no pain; no cough; pulse good; won't eat; thinks he will die. What would you do for him, Doctor Vincent?"

He replied without hesitation, and to my surprise, "Pitch a tent; put him out in the sun; give him a penknife and a shingle." The man looked up, a quick response in his face.

"Could n't we manage it?" I said to my young aide. "I will speak to the steward."

"I hate," said I aside to Vincent, "to see a man bent on dying. They sometimes go unaccountably to death. I once saw in Paris a man from whom Roux had removed a small tumor of no moment. The man said that he would die, and the old surgeon remarked to us that he did not like that. The patient was dead in two days, and no man could tell then, or on examination, what killed him."

"Did you ever," said Vincent, "see a man die because he willed to?"

"No," I replied; "nor escape death by mere decision not to die. The resolution to do whatever is needful to get well, the belief in its pos-

sibility, help men; that is all. I once heard a man with cholera—a sturdy mechanic—declare that he did not mean to die, and would not. He tried to make himself think he must get well. The thing was most painful."

"And he died?" said the nurse.

"Yes; he died."

In the next bed a young carpenter lay ill. He had the clearly cut American features, neat mustache, and Vandyke beard so much worn by his class.

"How are you, Joe?" I said.

"Oh, better; a lot better."

I went over his case with care. "Listen here," I said to Vincent. My friend bent down awkwardly, listened a moment, and then followed me away.

"What was that I heard like a rattle?"

"Yes, a death-rattle—a sentence of death in clear language," I answered.

"It is strange to have a man's lungs talk to one. It is a language. Shall you tell him?"

"Not unless he asks me. I have told his relatives."

"And will he ask?"

"Probably. A hundred years hence or sooner we shall cure such cases. I hate these inevitables in medicine—cancer, consumption. Come, here is something better."

"Good morning," I said to a pale, sallow creature in the next bed but one. He shook his head. I took a slate off his bed, and wrote, "How are you?"

"Oh, better," he said. "I understood twice yesterday. Then it went."

"Back better too? Have you books enough?" I wrote.

Vincent lifted one from his table; it was a harrowing tale of piracy—poor trash.

"I will send him 'The Three Musketeers,' if you will let me," said my friend.

I went on: "He is word-deaf. He hears but cannot interpret. The connecting nerve-threads between word-memory (I mean ideas gotten by hearing) and his receptive organs are broken, but he has word-vision; words which he reads are still usefully dealt with by the mind. He fell a hundred feet from a scaffold and broke his back. He is going to recover. It is curious that he has no memory of the events which preceded his fall for two hours. It seems as if time were needed to fix the records of memory. I have seen this often. Some physical shock interferes with the permanence of the delicate impression made on the brain-cells. It is like interrupting the fixation of a photo picture. It is so in battle. The hurry of emotions, the swiftness of the march of events, the mad fury of fight, have a like effect, and hence with the coolest the memory of the details of a battle are apt to be imperfect.

But let one of these men be wounded so as to make him a passive spectator, and thenceforward he remembers all that goes on."

"I wonder," said Vincent, "if death, too, is like the shock of a fall, and crushes out all remembrance of the past?"

My young resident doctor looked up at him with a quick glance of curiosity, and said, "Do you recall, Dr. North, that girl we had here last year who forgot only people, and ceased to know even her lover?"

"Yes; and everything else remained as before."

"Too much memory, or too little," said Vincent. "Who could choose?"

"I would take too much," said the resident.

"Wait till you are forty," said Vincent.

"Come, doctor," I said, "it is not the curiosities we came to see; you will find them in every ward. They have their own value to us; but now we can't talk of them." So saying, I turned to a bed near by. On the table were several books—a volume of Shakspeare, and a novel or two from the hospital library, the Bible (as on all the tables), and some magazines. The sick man was about thirty-five years old, clean-shaven, large of feature, but very pale, and huge of limb and hand. As we came near a smile of singular sweetness welcomed me. "My friend Dr. Vincent," said I.

The sick man put out his thin hand and greeted us in turn, saying, "I'm what they call an interesting case, sir." I sat down beside him.

"Mason, doctor, is a workman in iron." He made the beautiful hammered-iron fire-screen in my study."

"I was a good workman," he said, "but I shall never strike iron again, sir—will I, doctor? Oh, I have asked that so often, and I ought not to. I beg pardon." There was fitness, almost grace of manner, in the apologetic checking of himself.

"Mason was hurt in the back, doctor, by the fall of a bar of iron. He knows how much I want to help him, and I am not without hope; but it may be long."

"Oh, I could wait, but I am that savage and irritable—I—"

"His wife was here yesterday," said my aid in an undertone.

"Books enough, Mason?" I said.

"Yes; and to spare, sir, and flowers too. Mrs. L— takes care of that."

"Sit down," I said to Vincent, "and talk to him while I see a case or two. He has made friends with books since he has been in bed."

"That's true, sir. It seems to me so queer now that I never heard of Scott before; and Hamlet, I know a man just like him. Ever read Hamlet, sir?"

Vincent sat down as I moved away, and while I examined two new cases I noticed that he was deep in interested talk with Mason. By and by I saw him shake hands with the sick man and heard him say, "Yes; I will come again," and then he joined me as I sat down by the bed of a lad of twenty.

"Is this a new case?" he said.

"Yes."

"Then let me hear how you go to work."

"I will try to tell you; it is not very easy without too much talk. Give me the bed-card," I said to my resident doctor. "Here. This lad came in yesterday; on his card you see his name, date of admission, a place for the diagnosis, and, below, lines left for diet and change of treatment; also here is a chart of the heat-curves. In this ward-book the resident has written out every detail as to his habits, inheritance, illness. Take this card and run your eye over it. It will save time. It is a guide to the note-takers so that a certain order may prevail in our histories of cases."

"I see, I see. No organ is left unexamined. But how can you get the time? And you must have a whole arsenal of tools, if I may judge by the recent survey made of my own throat and eyes."

I laughed, and my resident doctor regarded this other physician with suppressed amusement, being himself a youngster who, by habit, eased the frictions of life with the precious ointment of mirth.

"Yes," I said; "I can, of course, make personally the whole study of a case. As a rule, here, where there is so much to be done that has to be done thoroughly and rapidly, one man goes over the eyes and other sense-organs, and one over the secretions, which may exact hours of work."

"And," added Vincent, "there are electric testings, I see. And reflexes! What on earth are they?"

This doctor who asked what a "reflex" meant was fast becoming too much for my resident, whose eyes were flashing with mirth, and narrowing to imminence of laughter. I touched his arm, as a warning, and went on: "Reflexes? Oh, reflex acts. I strike on a spot, say, below the knee, and a certain muscle instantly and in health always replies by a movement. There are many such. I might call them muscle-instinct acts."

"I see," returned Vincent. "It becomes clearer to me if I think of some of our instinctive acts as intellectual reflexes. There ought to be a new word—instinctions."

And now my resident cast a look of solemn wonder at this reasoning ignoramus.

"Let us put that to Clayborne," I said. "I want to show you how complete, how pains-

taking, is our work; how efficient it is. If that sick boy were lord of a guinea a minute no more could be known of his case, no more could be done for it. Let us talk about this again when we meet. A hospital is a fertile text. We are at our best here. Illness in a private dwelling loads one at times with needless perplexities."

"One word more, North. I had an idea that you often made—well—made what people call a diagnosis by intuition; at least one reads of such things."

"Rather by tuition so complete that the intellectual act for the moment escapes analysis. Your idea belongs to the medicine of fiction. We do something like that, of course. A man walks in, and we guess at a look by his walk that he has disease of certain columns of the spine. It appears like magic to a layman, but after that comes the real and careful work. What is the cause, the man's history, his general state of health—these are the valuable things at which one cannot merely guess and rest tranquil. It is true that often we reason from dubious premises to conclusions as doubtful, and that requires a mind of very peculiar type. It is quite remote from the mathematic faculty."

"Yes; I do not well understand how a great mathematician could ever be a physician of force. Galileo gave up medicine, I believe."

"The present case seems clear to me," I said, and, as we moved away, "I wish it were not. He has an aneurism of the arch of the aorta, the great artery. It compresses nerves that give motor activity to the muscles of speech."

"Then death is certain?"

"No; not quite. There is a chance, a small one; and he is young. That will help, except that it will make him impatient, and he must have six months of absolute rest in bed, and heroic doses of certain saline medicines."

"I see. And, pray tell me, do the young or the old bear sickness, long sickness, best?"

"Oh, that is a matter of temperament, of moral construction. Children well, I think; women too well."

"Too well?"

"Yes; to get a man into bed and a woman out of bed is almost equally difficult. But come; I am through. What about Mason, Vincent?"

"Oh, that poor fellow. You know people talk to me about themselves. It is a doubtful privilege."

"Yes; and he is as reserved and self-contained as a well-bred lady," I said.

"He told me of the wife, who is weak and giddy-minded; of his six children, like to starve or to go to the poorhouse. I shall see them to-morrow. Who is this Mrs. L—— he talks about?"

"Oh, an angel, a heart of gold. I wish we had a hundred like her."

"It is awful, is n't it, to see these many cases which only money can help? A mere question of money."

"Not altogether, but largely; yes, very largely. Look down this ward. I could point you out a dozen whose cases could be helped by money. This man needs a few weeks in the country to complete his cure, that man a month of salt air. Here is one so troubled because he will lose his place that cure becomes difficult. Here we are like to fail with another because he does not know how to feed his children while he is ill. The beneficiary associations help. Women like Mrs. L——, or as like as God allows, come between these people and their wants—wants which in illness you and I do not know. These wrecks of sturdy men talk to such women as they rarely talk to us. Women are the natural confessors of men; but, after all, there is always the lack of money. If I could do it, I would give every hospital a contingent fund—some thousands a year—for just such wants. And the people you see here are mostly mechanics—rarely mere laborers—proud as only the American is, loathing charity, and having to be taken with tact. And now good-by; I must have talked you tired, and said but half."

"No; you have brought me close to many things of which I had no clear conception. But it does seem to me that yours, my dear Owen, must be of all modes of usefulness the saddest."

"No; we were not sad in war, or we were rarely so, with comrades falling around us every month, and this seems to me much like it. One gets used to it. Who is permanently saddened by the ever-repeated inevitable? None but the morbid, I fancy. What I personally hate is defeat, by death, by incurable ailments. I have the feeling, which all physicians ought to have, that every one should get well; that all disease is curable somehow. It is, I suspect, the intellectual defeat I so dislike; but there is a host of compensations."

"Thank you. You have really opened to me a vista of the physician's life which is worth a good deal."

v.

A WEEK later I met Vincent one evening in the street. "Come," he said; "I am going to see Clayborne. I fancy we shall find St. Clair also. Have you seen our iron-worker to-day?"

"Yes; and he is really better; your talk did him good. What a tonic is hope. I fancy you helped him more than you know. He tells me that you are about to secure a patent for him. Is it worth while?"

"Yes; I have submitted his model to S——. He tells me it is a very novel invention, and

will bring him a good deal of money. It has been a pleasant task for me. The American of his class is so interesting, so self-respecting, and so just; I may add, so well-mannered. But here we are."

Clayborne was a bachelor, older than the rest of us, and a man of large fortune. We were shown upstairs to the top of the house, the whole area of which (and it was large) was occupied by his library. From floor to ceiling, all around, were books. They overflowed on to the floor, the chairs, the many tables. Although he was as to his writings a historian, his tastes in literature were nearly limitless, and it seemed to me that he read everything save modern verse. The last novel, the last magazine, the newest work of travel, even science, seemed to interest him. For modern poetry alone he had no strong liking. A slow thinker, he was also defective as to his power to enjoy wit or humor, and was apt laboriously to analyze a jest. I should prefer to say that he enjoyed mere rollicking fun, examined wit with a kind of scornful indifference, and was simply inaccessible to humor. Although a kindly man, he lived too much alone with his own very keen intelligence. He was apt to reason himself out of all beliefs in the need of attending to the duties of social and public affairs with an ease favored by his liking for books and a lonely contemplative existence. He had had fancies for several women, but, as Vincent once remarked, he was apt to set his cool brain to hatch the eggs of a warm heart, and then was surprised to find his eggs addled.

When we entered the great, airy room, with its busts of philosophers and its legions of books, St. Clair was seated at an open window, and the stalwart owner was walking to and fro with his hands behind his back. He was discoursing volubly to the sculptor on Greek and mediæval art. Now and then he paused to turn up a gas-jet; for he enjoyed a superabundance of light, and even on a hot night in July, despite our entreaties, delighted to illuminate his study as if for a winter ball.

Both men greeted us with the conventional "How are you?" Vincent had a mental habit which in some men would have looked like affectation. He was apt to pick up for examination any usual word or phrase, and say about it something most unusual. It made him as a talker very suggestive to quick-witted people; but to others this habit was apt to bring embarrassment, silent dismay, or one of those acquiescent phrases which kill conversation.

He said now, "Why does everyone say, 'How are you? How do you do?'"

"Why not?" said St. Clair.

"Why not?" cried Vincent, dropping into a chair. "Am I always to be reminded that I

am mortal? that I may be ill any day? It is a bit of universal bad manners."

"Of good, I should say," returned Clayborne.

"I do not agree with you," cried Vincent. "It is my friend's business to say how well I look; certainly it is an impertinence in a mere acquaintance to enter into the question of my health. I wonder how it began? I should like to know if an Indian or a Hottentot asks how his savage neighbor is."

"The mass of humanity must like it, or the custom would die," said our host, reflectively.

"Bad manners never die," returned Vincent, smiling.

"And what is the best test of good manners?" I said.

"Capacity to listen agreeably," said Clayborne. We all laughed, for the speaker was at times given to discourse.

"I don't see why you laugh," he continued. This provoked a new outbreak.

"The hardest test of manners is the capacity to submit to an obligation with graciousness," I ventured.

"I should say," said St. Clair, "the power to oblige with grace."

"I can do neither," cried Clayborne. "I hate being obliged, and I hate to oblige, because there is no end to it. The man who obliges gets in debt. There is nothing obliges like obligation."

"Oh!" ejaculated Vincent.

"Yes; both embarrass me—to oblige and to be obliged."

Said Vincent: "It is the complexities of life which annoy us. The man who gives with joyous simplicity gives, as we all should give, for his own sake. The simply imaginative, kindly man expects to do his own thankfulness. 'The Lord assisteth the simple.' It is self-analysis which breeds annoyance. I was walking in the Tyrol years ago, and found a charming wayside fountain over which the giver had set the words—I can translate them roughly—

'Ye who drink
Pause and think.'

An old Englishman who came up as I contemplated the inscription said to me, 'That man had bad manners.'"

"The point is too fine for my use," growled Clayborne.

Said St. Clair: "There is an equally odd inscription on the marble floor of a lovely spring in an English wood I know. It puzzled me."

"And now the talk has gone astray," said Clayborne, discontentedly.

"And so it should," I replied.

"But St. Clair always gets adrift."

"He's a poet," laughed Vincent. "I should define a poet as a man with buttons to his mental

garments and no' buttonholes. He is always fumbling at the impossible."

"Now, wait a little," cried the poet, mildly wrathful. "Who's adrift now?"

"Oh; your fountain," said I. "What was the inscription? Never mind these fellows."

"It is not worth quoting," said St. Clair.

Clayborne had, without intention, a special power to annoy him. Looking up, however, St. Clair caught Vincent's appearance of utmost interest. It seemed to say, "You are just now the only person in the world worth hearing." It was an inherited trait of manners—a family jewel.

St. Clair went on: "I make too much of a trifle. On the marble-floored spring, in letters of red stone, were the words, 'Tell us your secrets.' At each side the spring rolled forth a bountiful volume of water, which, as I looked, seemed to contort and shake, and at times to hide the legend."

"What did it mean?" said Clayborne.

"Was it," I returned, "advice to confess to the waters? That were safe indeed."

"Or," said St. Clair, "was it a mere pretty, fancy-born appeal to them to tell us their secrets?"

"Ah, if they but would!" murmured Vincent. "I am for St. Clair's idea of it. When you make a fountain, master sculptor, set around it that verse of the 19th Psalm. It is not there applied to the waters, but, like all high poetic thought, is capable of many applicative uses. I quote the Prayer-book version. It is, I think, 'There is neither speech nor language; but their voices are heard among them.'"

"That would be charming," said St. Clair.

Clayborne picked up his unwieldy length, and, as Mrs. Vincent liked to say, added on his legs last, and, having put himself together, went to a corner, whence he took two or three books in turn, and while we went on with our chat looked them over. Presently he came toward us, for we had dropped at last into cane easy-chairs, and were all smoking together near the window. "Vincent is apt to get his quotations incorrect," he said. "The words apply, of course, to the verse before, 'One day telleth another; and one night certifieth another,' and also to the preceding verse. I should hesitate to use it as Vincent suggests."

"But I should not," cried St. Clair.

"King James's Bible," Clayborne went on, "says, 'There is no speech nor language where their voice is not heard.' And here, this will interest you. My old friend, Leeser's translation for use among Hebrews, has it, 'There is no speech; there are no words; their voice is not heard: but their melody extendeth through all the earth, and to the end of the world their work,' and so on. For force, beauty, and clearness this is better than our version."

"Let me look at it," said Vincent.

"This is the octavo," said Clayborne; "the quarto edition is full of notes, and more interesting."

"I see," returned Vincent, as he glanced over the book. "The renderings of the poetic forms of Deborah's grand ballad-poem are admirable. I will borrow it, Clayborne."

"I have had it bound in two volumes," returned the scholar. "I dislike thick books, fat books, books which do not lend themselves to the hospitality of the hand. I hate to lay a book open on the table and see it shut itself up. If a man lives with books, he gets sensitive about their dress and their manners."

"How poetical he is!" said St. Clair, who was apt to have a long memory for small annoyances.

"Is that your idea of poetry?" growled our host. "Take both volumes, V."—he had a fashion of calling us by the initial letter of our names,—both, please. And don't forget to return them. I hate to lose books; but to lose one volume and to have the other as a perpetual reminder of the baseness of mankind is unendurable."

"Do you remember," said I, "S——'s keeping one of your volumes of 'Cardan,' two years ago, and your sending him the rest with a note to the effect that if he would not return volume one, it were better that the family were kept together?"

"Oh, I do, indeed. And then he sent them all back. I knew he would, but the volume he had kept so long was horribly abused. Actually the man had made penciled comments on the margins."

"That does seem incredible," I said.

As to Vincent, he smiled in his quiet way when requested to be sure to return the books.

"What did a man like S—— want with the book?" said St. Clair. "I know of Jerome Cardan in a dim sort of way. He was a doctor, I think."

"Oh, but he was a master of algebra too," said I, "and S—— is a mathematician. And a banker, too, by all that is strange. Mathematics is his hobby. He is a common fellow, coarse of grain, strong of head. A hard business man, and horribly exact in his dealings; full of prejudices; full even to hostility for those who differ with him, but very generous. I know him well."

"I should like to know your full estimate of us," cried Vincent, with a laugh. "I can understand the perfect compatibility of generosity with exactness, even cruel exactness, in business. It is not a rare type."

"And to me," said St. Clair, "it is incomprehensible."

"I can at least illustrate it," I returned. "On one occasion I knew him to ruin a man by insist-

ing on the return of money lent. He declined to wait, took the last cent of what was due, and a month later lent the penniless man a really large sum on easy terms to start him in business again."

"I know of a case quite as illustrative," said Vincent. "A friend of mine, a physician, did a rich manufacturer a vast service in the way of his profession. When the obliged man asked for his account, he requested a deduction for prompt payment, and this being declined, grumbled over the amount. The doctor was immovable. 'You are at liberty,' he said, 'to pay nothing or all.' 'But this is business,' answered the other; 'why not discuss it like any other business?' 'I am not a business man,' said my friend; 'I belong to a profession. I sell that which no man can weigh or measure.' Finally the bill was paid, and then the manufacturer, suddenly changing his tone, said, 'Well, now that the business is completed, I should like you to accept this as a slight proof of our gratitude.' It was a check for thrice the amount of the debt. The doctor said, 'No; I never allow a man to overpay me.' The next day the check was sent to a hospital in which the physician was interested."

"I like that definition of a profession," said Clayborne. "I think I can guess who the doctor was."

Vincent looked up with a faint smile.

"The story is true," I said. "How difficult it is for us to comprehend these men who are born and bred in a commercial atmosphere. The type of mere business men, devoid of this man's generosity, is a more unpleasant one."

"Oh, I know them," cried Vincent, "and I see them, too, as you do not, on the business side. They have set ideas and utter absence of tastes or pursuits outside of the game of money-making. I mean that they have in life no other game. They do not read, or shoot, or fish, or even ride. They have no liking for books, or art, or music. Travel soon bores them, and brings no new resources."

"The nemesis comes with loss of health," said I, "or with some threat of incapacity to work. Then the doctor says, travel, and either the man does not care for that, or will not obey, or goes like a bird in its flight from land to land, and comes back to his desk unutterably weary. It is useless to say, shoot, fish, ride. He has but one taste in life, and habit has made all else impossible."

"To do him justice, it is not always the money but the game he loves," remarked Vincent. "I think the gospel of play needs to be preached in this land of ours."

"The moral is," said Clayborne, "have a hobby."

"And learn to ride it early," said Vincent, rising. "I must go." And he left us.

For a few minutes we smoked in silence. Then Clayborne said, "V. has left his books."

"Yes," I returned; "when he put them on the table I saw, as he pushed them aside, that he would not take them."

"Why?"

"You asked him to be sure to return them."

"I did. What then? What of that?"

"He did not like it. He is as sensitive as a girl, and as reserved as a man can be."

"And I annoyed him. I will send him the quarto to-morrow, and ask him to keep it. How queer for a man of his force."

"His sensitiveness is a part of his force. He sees and feels as by instinct all the shades of difference in men's ways and conduct. His reserve hides the effect on himself. He is master of his moods, however they are caused. Socially, as now, he may act on his too ready sense of the meaning of a word or a phrase lightly dropped; but even this is rare, and in his profession his fineness of perception never does him harm or injures his value."

"I see," returned Clayborne, thoughtfully. "Go on; it interests me, well as we know him."

"I could wish that he had the art to appear unreserved," I said. "Reserve is disliked by men in general. Familiarities, even from friends, I fancy Vincent finds it hard to bear."

"And yet, what friend can compare to him?" said St. Clair, who was like a child with those he loved. "He is manly, brave, and generous as few men are. And what I like, too, is a slight old-fashioned quaintness about him quite undefinable."

"His ears should burn by this time," said I. "And where, indeed, as he would say, did that familiar phrase arise?"

"Do one's ears burn at praise?" said Clayborne.

"Praise me a little, and try," said St. Clair. "Come, North, it is time we went home. I wanted to go back to that fountain, but it is too late."

"I meant," said I, "to add a word to what you said of Vincent's manners. It is the manner of his manners which makes him so charming. Many men have good manners; few men have manner."

"Too fine for me, that," cried Clayborne. "What is manner?"

"The grain of the wood under the polish," returned St. Clair.

"The modification which character gives to manners," said I.

"Shade of Chesterfield, help me!" laughed Clayborne. "Get ye gone, both of you, or I shall go mad."

DOLCE FAR NIENTE.

OWNED BY J. M. LICHTENAUER.

A GARLAND.

LET me a garland twine
For poets nine,
Whose verse
I love best to rehearse.

For each a laurel leaf,
One stanza brief,
I make
For memory's sweet sake.

First, then, THEOCRITUS,
Whose song for us
Still yields
The fragrance of the fields.

Next, HORACE, singing yet
Of love, regret,
And flowers:
This Roman rose is ours.

OMAR-FITZGERALD next,
Within whose text
There lies
A charm to win the wise.

Then SHAKSPERE, by whose light
All poets write:
The star
Whose satellites they are!

HERRICK then let me name,
Whose lyrics came
Like birds
To sing his happy words.

Then KEATS, whose jewel rhyme
Shines for all time,
To tell
Of him the gods loved well.

LONGFELLOW next I choose:
For him the muse
Held up
Song's over-brimming cup.

Next TENNYSON, whose song,
Still clear and strong,
Soars high,
Nearing each day the sky.

Then ALDRICH—like a thrush
In the dawn's flush,
Who sings
With dew upon his wings.

These are the nine, above
Whose leaves I love
To lean,
My happiness to glean.

Theirs are the books that hold
Joy's clearest gold
For me,
Wrought into melody;

Theirs are the words to start
Within my heart
The fire
Of song and song's desire!

Frank Dempster Sherman.

NEW YEAR'S EVE.

SEEMS like the years go spinnin' by to reg'lar quickstep time
 As soon as ever oncet a man has got beyond his prime;
 An' here 's the Old Year goin' out before it 's fair begun!
 Heigh-ho! — Well, here 's a Happy New Year to ye, all an' one!

Days uset to go too slow for me, the time I was a boy,
 An' first an' last they evened up less misery than joy;
 But now—well, well, I won't complain; of joy I've had my part,
 An' winter's frosts ain't stopped the springs of laughter in my heart.

One thing the Old Year 's brought to me, an' that 's a real good friend.
 Who 'd thought that neighbor Gurley, now, could ever quite unbend?
 Three years we 've lived here side by side, the calendars aver,
 An' not a word had we exchanged except "Good evenin', sir!"

Well, I met him Chris'mas mornin' as we came along the street;
 I was just a-reachin' my door, an' he his, we chanced to meet.
 So I tried him with a smile. Says I, "Well, neighbor, howd'y' do?
 Merry Chris'mas!—an' I 'm thinkin' I 've got *Chris'mas gift* on you!"

Thought a minute he 'd 'a' fallen, the way his features twitched.
 Then he give a hearty chuckle, an' says he, "Well, I 'll be *switched*!
 Why, that takes me forty *year* back!" An' he give my hand a shake
 Till my arm from wrist to shoulder for a good hour felt the ache.

So we chatted for a little, an' at last he says to me,
 "I 'm a pretty lonesome fellow; can't you come an' dine with me?"
 An' that evenin' I went over. (Susie's children had a "hop,"
 An' them young folk made a bedlam where I did n't care to stop.)

I 'd a mighty pleasant evenin', an' I found out—well, it 's strange
 How you can't size up a neighbor when you meet him just on 'change!
 I 've heard from other parties—he 'd have never told himself—
 Gurley 's got some square ideas about other things than pelf.

He had just that very mornin' sent the Children's Home a check,
 An' had helped an old-time schoolmate of whom drink had made a wreck.

Beats all *how* some folks can do such things an' keep their faces tart —
What 's the open hand at Chris'mas, though, without the *open heart*?

Kind o' cast-iron grin his smile was, but he thawed out when I spoke,
An' to make things kind o' easy I worked off a little joke;
Why, he fairly *keeled* with laughin', an' he slaps me on the back,
An' before an hour was over we was callin' Seth an' Jack.

Settin' cheek by jowl an' tellin' 'bout the times when we was young,
The huskin's an' the quiltin's, an' the old-time songs we sung,
The coastin' an' the sleigh-rides, an' the dancin' in the barn;
An' at tellin' old-time stories he could cap me, every yarn.

There we set a-swappin' chestnuts till the wood fire died away,
An' the bells a-chimin' midnight ushered in another day.
But before I left we made it up to meet to-night ag'in —
For we 're bound to set the Old Year out, an' see the New Year in.

Alice Williams Brotherton.

BENTLEY'S SYSTEM.

WAS at work in my little den at the "Evening Appeal" office. The paper had just gone to press, but I was hurrying to finish before going home a "special" for the next day's issue.

Through my open door I could see the dingy desks of the so-called editorial room, most of them vacated now, and from the farthest corner came the drone of a proof-reader. Glancing at this familiar scene, I stopped my writing a moment as my eyes rested on his copy-holder. Instead of the rough young hobbledohoy who usually filled that place, there sat the most young girl-like of young girls, making a sunshine in the

grimy place. She had soft light-brown hair drawn smoothly back into the decenterest of little knots; she turned toward me the neatest of little profiles; and she devoted herself to her copy with the gentlest bend of her small head. Just as I was idly recalling the fact that old Martin the proof-reader had once confided to me his desire to get this position for a daughter of his, Bentley, the "star" reporter of the "Appeal," came striding in and toward me.

"Spare me a minute from the tariff?" he questioned, standing in my doorway, pushing his silk hat to the back of his red head with one hand, and resting the other, which held a lighted cigar, against the door-frame.

When I had declared my willingness to lay aside for a time those political labors with

which it pleased Mr. Bentley to imagine me always occupied, he took off his hat and laid it with his cigar on the steam-heater outside, came in and seated himself astride my vacant chair, and for a moment stared at me in silence over the back of it.

When he spoke he said: "I'm going to ask a favor of you, Miss Addington, and I wish by a large majority that it was you going to ask one of me. Oh, yes, I know; you're a mighty nice, pleasant, accommodating little girl,—that's aside from my wanting something out of you just now,—but you don't have it any too soft down here, anyhow, and now I'm going to ask you—I'm ashamed of myself. But—well, let me open with the curtain-music, and work up to the last farewell by degrees. The beginning is"—He stopped, waited an instant, got up and turned his chair around, sat down properly, and took up his sentence again as if he had never dropped it—"that I'm in love with and want to marry that little nimini-pimini, white-faced girl of old Martin's out there,"—then relaxing a little from the uncommon seriousness with which this was said,—“and I'd give a hundred dollars to be able, without arousing suspicion, to get hold of that seat that Calvert has there by her. That ain't sentiment, 'I-would-I-were-a-glove-upon-that-hand' kind of business; it's pure science. That desk is the strategic key to the whole campaign. I'm not in with Calvert; we've been hating each other too long for me to be able to work up intimacy with him now just previous to asking him to give me his desk, and it would be too thin, anyhow. There is no way to get that desk—here comes the climax,"—Bentley stopped, and looked at me deprecatingly, appealingly; I was amused to see that he could command such an expression,—“unless”—he stopped again, scowled, and drew a long breath in burlesque of his own discomfort and his resolution, and, as he would have said, took the plunge—"you'd be so angel white as to let him come in here. He's been wanting to do that this long time, not altogether because of his secret desire to be near you, but he thinks it would be nice to be in here away from the lower orders, and convenient to the encyclopedias that he gets his little pieces out of."

The "Appeal's" limited library was in the room I occupied. Expression of my willingness to share my seclusion with Mr. Calvert did not still Bentley's desire further to explain and justify himself.

"You see," he went on, "I've got the campaign all planned out, though I can't explain it in a word. I'm perfectly willing to explain it, however. I'm even willing to admit that it would be a pleasure to me to do so. I'm too old and tough to talk about this kind of thing

to a man, but there's a sensible diminution of a dangerous pressure in letting off to you a little."

I shall utterly fail in giving any idea of Bentley unless I am able to convey an impression of the personal unconsciousness that characterized his conversation. He expressed himself in the way that was easiest to him—that is to say, as much as possible by established formulas intelligently applied, sometimes slang, sometimes quotations that became slang in his mouth; but though he often felt the humor of his own ideas, his verbal clothing of them rarely enough attracted his attention.

He turned a look at once grave and quizzical—and several other things—through the door and upon the copy-holder.

"Nothing's going to change me about wanting that little piece of propriety out there but getting her," he remarked.

"No, not altogether quite so sudden as you might think," he said when I expressed my interest in the speed with which he had discovered his intentions; "she was here last month for a week—when you were off doing the woman's convention. I have n't ever gotten her out of my head since. It was sudden enough, and I'm hit hard enough. I'm going to put my system to work now for all it's worth." He turned back to me, hitched his chair half around so that the distracting picture in the other room was out of his range of vision, and went on:

"You've heard that there is a right and a wrong way of doing everything. Well, my system is the one right way of going courting—when you're courting a woman, that is; I'm sorry it's not fitted to be more use to you. I've got faith in it, or I'd be—" He shook his head slowly in a manner significant of a most uncertain frame of mind. "You can see with half an eye," he continued in a moment, "that that little thing there has n't been put through any mill that would make her think—put her on the lookout to get married. She is n't that kind, anyhow. That's why—one why—I want her, and of course that's the very reason I ain't likely to get her. This world's run that way."

Bentley gazed far out of the window, his upright red hair looking even more astonished than usual as the countenance it surmounted took on an uncommonly grim expression. Then, without moving his head, he brought his eyes back to mine, looking at me sidewise with a return of something of his usual twinkle, a twinkle in eclipse, and declared:

"It's the system I'm asking you to pay tribute to. I'm free to confess, Miss Addington"—here a faint, incredible shade of embarrassment seemed to cross Bentley's counte-

"SHE SPOKE OF HER ENGAGEMENT."

nance—"that I never truly loved before; but yet—" Bentley lifted and knitted his brows as he scratched his head with one finger, and looked silently at me.

I was constrained to say, "Why, yes, Mr. Bentley; 'but yet —'"

"Egg-zactly," he answered heartily; "you are the sort of person that I like to talk to. Well, now, my system is applicable in dealing with any young lady whose good will you wish to gain—whose good will you wish to gain," Bentley repeated, brightening with enjoyment of the felicity of this phrase.

"I've had it in shape pretty nearly ever since my coming-out sociable at Cranberry Center. Not with unvarying success; I don't say that; but it's done its part, it's done it well. Is n't as if a professional beauty were using it exactly; I know that. I have faith in it—I always have had, that is; but now the sight of that white mouse out there takes all the starch out of me. Curious, is n't it, though I don't suppose —"

"I think, Mr. Bentley," I interrupted, "that

you are talking against time to put off telling me what your system is."

"Get there every time, don't you?" said Bentley, admiringly. Then fixing a queer look upon me in which again appeared that amazing suggestion of shyness, he said slowly:

"Hang around, and say nothing; hang around industriously"—pause—"and say nothing, till more or less urgently invited to. You press the button and we do the rest; these directions are capable of fifty different adjustments to suit the most complicated case." Bentley was speaking these last sentences half abstractedly, and watching my face anxiously.

As the mystic significance of this formula penetrated my brain I was moved to mirth—mirth that was not lessened by the fact that I was visited by a sudden illuminated vision of the system's possible workings in practice—a vision which at once convinced me of its value.

I wiped my eyes, and gave my hand to Bentley, assuring him that I believed he was master of a great secret.

"You do really?" he broke forth eagerly

and seriously. "Say, Miss Addington, you would n't guy a fellow in my fix now, would you? That's only the opening of the campaign, but that's the great critical period, don't you think? That's the merit of the system, it attacks the opposing sex (opposing sex—not bad, is it?) through their curiosity, see, and they quit being so all-fired opposing, early. Generally you can count on 'em to become helpful pretty soon—helpful in some degree; then 's the time for the next move. I'm not much at explaining these psychological phenomena, but the system 's all right. 'This conviction is arrived at through a *a priori* reasoning, and is confirmed by subsequent observation.'" Bentley stood up as he delivered this last sentence, and looked down upon me with a pleasant combination of sad appeal and humorous patronage; he was quoting from my maiden editorial, a document that had filled him with mysterious mirth.

I began to arrange my papers for departure, assuring him in the mean while of my good will toward his enterprise—that seemed the right word for it.

He apologized for taking so much of my time, and yet further explained his needs and plans, as, for instance, his "scheme" for letting Calvert know that the way was clear for him to change his desk, while he was standing feeling for a match, and I was putting on my hat and coat.

"You see," he said finally, barring my way a moment at the open door, "it is hopeless for me to try to hang around in Hoboken—that's where old Martin lives. I don't say I'm sorry; anything but Hoboken. But there it is; it is perfectly clear that however I might walk in the letter I'd blow the whole spirit of the system the minute I stepped my foot into the parental flat. It's too late to do the Damon and Pythias act with old Martin. I'm forced to abuse your generosity. Thank you, thank you; it's been a boon to talk to you, it has indeed. I'll work the racket with Calvert a little slow; maybe a day or two before I get it around to him that the coast is clear. Then I'll have to wait upon occasion for a good excuse to jump down there and take his place. If the office gets on to me there's no telling what'll be to pay. Good day, good day; I'd jump at the chance to help you get married."

Bentley picked up his hat and his cigar, put the one on the back of his head and the other in his mouth, just as he gave me what was in spirit a courteous, grateful little nod of farewell.

Old Martin's little girl still bent her pretty head studiously over her copy without a hair's-breadth's variation of attitude.

Calvert had just come in and seated him-

self in scowling introspective preoccupation at his desk.

That was the last I saw of the office for three months. On the way home, through the untimely movement of a car, I sprained my ankle, and for a weary while was confined to the house.

In a few days, however, I began work again, writing as I lay on a sofa, and depending on messenger-boys and visits of mingled business and condolence from other members of the staff to keep me in touch with the office.

I had been at home perhaps a month when one day Mr. Maloney, a gentleman who filled by turns many different positions in the "Appeal" office, each, as a rule, being less important than the last, was ushered in. The joy of gossip lighted up his bleary blue eyes.

"And how are you, Miss Addington?" he began—he had a charming touch of brogue—"And indeed it's enough to make the Old One himself sorry for you to see what a good time you get out of the worst of occasions. That is a bit of a paradox, you are saying, and so is every other true thing that ever was remarked in this topsyturvy world; and you are the one that's got the philosophical head on your shoulders to find that out long ago, without waiting for an observant old blind mole like me to tell you. Yes; I'm an illustration,—allow me."—Maloney shakily stooped to pick up my pen.—"I can serve as an illustration when you write your celebrated treatise on the paradoxical. And now don't interrupt me for the space of a minute; you're a sad chatter-box, Miss Addington." He stopped and laid an unmanicured forefinger against his grizzled temple. "I'm preparing the way to a graceful transition; I would be telling you something that is for your amusement. I am an observant old mole, I was saying, and now I can't be giving you one particle of useful information as to whether or no the boss is going to sell the paper out to the Republicans next week, nor as to what will become of you and me if he does, though I dare say there are other blind moles that have discovered all that; but I'm about to tell you that that big brute Bentley is in love with that old proof-reader's little girl, and none in the office knows it but me and him, and it's ten to one I know it best! Yes; sure I thought you'd be grateful to me for a little diversion like that. It's not every day you can see, or even hear, what a brass monkey's like when it's in love. Its experience much more resembles that of a white man than you would ever imagine, and that's the truth. No; he's not trying, as he would say himself, worse luck to him—he's not just trying to mash her; he's in love, I'm telling you, and his feelings are not dissimilar

to those depicted by Tom Moore and other poets that the hulking ignoramus never heard of—and there is the paradoxical for you. Me bald spot was bigger than a trade dollar before I could have believed such a contradiction possible; so think what an inexplicable surprise it must be to him, that has no more power of ratiocination than me blackthorn there. I have been industriously gathering the evidence for days, till me conviction was complete, before I 'd come to tell you."

"Well, now, the first I noticed was the way he went white and red when she came to speak to him about his copy one day. It fills me with rage to think of that, it does indeed. To think of him having the additional impudence to exhibit a capacity for changing color like a girl!"

Maloney stayed an hour, and I am sure missed an assignment, telling me with infinite relish of detail all the ins and outs of Bentley's manoeuvres.

"He used to write exceptionally clear copy, you know," said he; "he has no more education than me pet cat, but he can write like a grocer's clerk, and he used to do it. I've edited his copy for all he makes such big money. When old Sheffield was managing he used to call on me to help him out when he was incapacitated with drink. He said—but it's no matter what he said; his betters have said more. But I've edited Bentley's copy when it was clear as print, and now, if you'll believe me, it looks little better than your own, begging your pardon. That makes business now and again with the proof-reader, you understand, and somehow he's hocus-pocused things till it seems as if Martin read nearly all his stuff; but I've not found out how he manages that." Maloney added the last sentence in a tone of apologetic regret.

"Does the little girl notice all this, do you think?" I asked.

"Indeed and I wish you were down there to say yourself. How can I tell? The little white still ones like that—the Old One himself can make out nothing about them. And Bentley's sly, wonderful sly, all around. I don't understand him, though; how should ever an Irishman comprehend the way of the likes of him with his brass and his slyness? Why don't he go at it like a man, and display to all the world that he's in love up to his eyes, and he's proud of it? That's what a woman likes, be she old or be she young."

Overweighted as I was with Bentley's secret, I was tempted to edge upon it by discussing this point, and I said that undoubtedly a woman was apt to like that kind of tribute, but I was not sure that it always followed that it made her like the man equally.

"And if he can give her what she likes, ought not he to be satisfied, I say, and if she does not like him so ardently, is n't there the less chance that he'll marry her to the sorrow of both of 'em?"

I told Maloney that he made my head ache, and he went away, pledging me to secrecy about Bentley. Nevertheless I was not wholly surprised when the next visitor from the office quoted Maloney as authority for the news that Mr. Bentley "was making—that is, he was paying attention, not exactly paying attention, but Mr. Maloney thought he was going to pay attention to that Miss Martin."

This visitor was the managing editor's type-writer, an elderly young woman, not bad-looking, but with a constrained manner, grayish hair, and a deep-lying desire for human intercourse that should be labeled intellectual, or, in her own phrase, to be sociable and improve herself with literary people—literary people being, in her opinion, any who earned a living by either the use or abuse of the written symbols of language.

"Mr. Maloney says that Mr. Bentley is—that he cares about her," she said tentatively, sitting uncomfortably on the edge of her chair.

I conquered the inevitable throb of resentment that I felt at the discovery, faintly expected though it was, that Maloney was just as confidential with the type-writer as with me; as I had felt myself rarely gracious in appreciating Maloney's out-at-elbows charm, and had credited him with a becoming sense of my kindness, this required an instant's communion with my higher self, and then I was rewarded by a delighted perception of how utterly like Maloney it was to lapse into intimate conversation with any petticoated object within his orbit. The appeal that these storied garments would always make to him was now reinforced, too, by that false sense of masculine dignity which makes men slow to gossip of familiar personalities with one another; even Maloney felt constrained for a time to give his really interesting and curious news only to the patronized sex, though, to do the staff of the "Appeal" justice, the time soon came when the artificial ice was broken, and Bentley's hopes, fears, and prospects seemed to occupy them night and day, to the manifest gain in color, vivacity, and value of their conversation.

Bentley had not been to see me since my accident, though he had sent me a bottle of champagne. I am sure I don't know how Bentley's sympathy ever found vent on occasions when a gift of champagne could not express it; perhaps such occasions never arose. Soon after the type-writer's call I got a letter from him. He said:

Have thought about elevating up to your maiden bower to see how you are, but I hear, anyhow, every day, and, judging by the way old Maloney blows about cheering your fevered brow, I conclude you get about as much "Appeal" office as you can stand. Then I've got that girl on the brain so bad that I'm no good. If I saw you I'd talk about nothing else. I'm working the system for all it's worth. There's nothing else for me to do. I'll send you a bulletin semi-occasionally. I lose so much sleep about the thing myself I feel as if the suspense were holding you back too.

I gave her my buttonhole bouquet day before yesterday. I've come down to dressing like a regular cane-sucker. She put it in a glass of water. Then I never let on I knew she was alive for thirty-three hours and a half. To-day I broke out in a fresh place, and asked her to have a glass of beer when the men got some at noon. That was coming things too close together, but I was nearly laid up with the strain of not looking at her for so long, and that type-writing girl, the old one, was here, and I gave her a drink too. You see this is all according to the system intellectually interpreted, the principle at the core of the system being to keep yourself before the public and not show your hand. That white rabbit did the unconscious act as if she'd been born before the footlights. She's a tough one. It must be put on; she must have her little attention turned my way some, don't you think? I've been keeping this thing up steady, but I'm afraid I'm losing my fine touch, and she not breathed yet. It makes my head swim, Miss Addington.

I guess you're putting up a thanksgiving prayer by this time because I have been keeping away from you. All right, put up another while you're about it on account of the fact that I'm going to stay away. And I'll make my other bulletins shorter; so there's another item.

If you'd think of something I could do for you it would be the best assignment I'll get this month. I'm in just as bad a fix as to obligations as if you were being bored by Calvert every day. You'll have it all the worse in the end; by the time you get back he'll believe he owns that room, and he'll only let you in as a thundering favor.

Bentley's next bulletin was made out in orthodox form.

SLIGHT VICTORY.

THE Besieged weakens so far as to snub Besieger. After the beer Besieger went into his shell. Forgot to say good morning. Opened the window without asking permission. Besieged in subsequent conversations was sternly business-like in a mousey manner.

N. B. After all, that's about her usual act, so probably there's nothing in it, after all. I wish a sprained ankle was all there was the matter with me.

Yours truly,

B. BENTLEY.

The next voiced a surprising proposition.

I am thinking [it read] of doing the ancient honorable and saying something to old Martin.

I don't know anything more about the little clock-works that run that tame lamb of his than I did at first. You might as well try to agitate a Waterbury; but the office seems to be getting on to me, cur-r-rses on 'em, and I'm afraid Martin may get fidgety. I bet it's that gabby old Irish-woman of yours that's been giving me away. I'd thrash him for the cash he's got in his clothes, just on the chance, if any one would guarantee that it would pay for a drink. Then if I blow off to him (Martin), ten to one he'll develop a colossal genius for making an ass of himself eighteen different ways.

This was the last I heard directly from Bentley for several weeks. In the mean time I occasionally had news of him from other people. An office-boy came up for copy one day, and after he had gotten it continued to hang around in an engaging manner. He was a nice boyish boy, and spent his spare time writing to some one whom he addressed as "Miss Tooty Fareman, dear Miss."

He was unnaturally careless of these letters (as of all other matters personal and professional), and once, before realizing what it was, I read the opening sentence of one. It ran, "The Hours I spend away from Thee Tooty are no good whatever, but I know you don't feel truly as I do." So you see he was prepared by experience to take an interest in the game of love wherever he saw it.

"Well, Jimmy, how are things going at the office?" I asked, just by way of being friendly, while he stood irresolutely by the door.

"They say—they say Mr. Bentley's in love with that Martin girl," said Jimmy, his tone even more than his phrasing showing that his callow contempt for feminine kind still included all of the sex but Miss Fareman or her successor.

"Do you think he is?" I asked.

"When I look at her I don't," he asserted. "She don't 'mount to nothin', but Mr. Bentley acts kind o' queer. He keeps lookin' at her when he thinks nobody don't see him; he don't notice me. He stops still sometimes and stares right before him till somethin' makes him jump. I think that's a bad sign, don't you, Miss Addington?"

At last the time came when I was able to make a little trip down-town. I went to the office, but not to the editorial rooms, because they could be reached only by means of a short flight of steps after leaving the elevator, and I did not want to attempt the climb. My errand was with that great person known here as "the boss."

The boss's name was J. B. Higgins. He was a big-brained, big-bodied, coarse-fibered, powerful old fellow, with a good deal of human nature in him. And though all the other women, and most of the men, in his employ stood in

terror of him, I did not, and so I did not, like them, altogether hate him. He was highly skeptical of good always and anywhere, but yet he had too much sense not to know that distrust can overleap the mark, can be tripped in its own net, and it always pleased me to see his suspicions both sustained and held in check by his sagacity.

He met me with his gray eyes peering alertly out from under his shaggy eyebrows and over his puffy purple cheeks, to see whether after all I had really been having such a bad time with that ankle. I had come down to fight out a little question of salary, and Mr. Higgins met me as both counsel and plaintiff on the other side. The contest and its result are matters aside from this history, but we are concerned with the touch of humanness that now and again, against his will and his theories, diversified his simple brutality, and to which we owe another glimpse of Bentley.

"The boss" always began an interview with me by a distinct declaration, in manner, that I was an employee, and only an employee, and that he utterly refused to take the slightest notice of the fact that I was also a woman. A helpless sense of his own small, much-degraded, much-outraged, but still not quite eradicated masculine instinct of chivalry toward women underlay and mainly produced this bluster, and a little tact could usually be counted upon to still it, and even to play upon his weakness so far as to insure the poor woman before him something like fair treatment — a thing he was by no means in the habit of according except on the self-respectful and unquestionably justifiable ground of immediate self-interest.

The queer thing was that this novel experience of disloyalty to his principles nearly always pleased him for a few minutes; he found it pleasant until the predatory habits of a lifetime devoted to "business" closed in upon him again, perhaps bringing about a reactionary irritation. To-day, when the question of salary was settled, he dropped back in his leather chair and began a little conversation. He was always above the familiar, cheap affectation of being impossibly busy.

He asked where I lived, as he had done more than once before, and what rent I paid, and what kind of a doctor I had, and then he said inconsequently, with his own odd compound of humor, suspicion, scorn, and simple human interest: "You'll be getting married some of these days just like any other fool. They say that ass Bentley is in love up there," pointing with a rough, fat thumb to the ceiling.

"I knew he'd turned almighty no account lately," he went on; "so when I got hold of this I sent for him and gave him some good advice; but he told me he wanted to marry

the girl. I had a notion to dismiss him on the spot."

He drew down his overhanging brows and looked at me as piercingly as if he were moved by some weightier motive than a simple elephantine, unscrupulous desire to betray me into an amusing burst of sentiment.

I only said how justifiable such a step would be, and how right he was in publishing Mr. Bentley's unworthy sentiments. His temper ruffled a little.

"A good deal more justifiable than you'd think," he asserted aggressively. "I wish I'd never knocked under to hire women."

"Oh, well," I replied soothingly, "you can comfort yourself with the reflection that you did it only to save money."

He shot another scowling, scrutinizing glance at me.

"Do you know the girl?" he asked.

No, I said; I had never spoken to her.

"She must be a queer fool," went on the man of reason. "Why don't she haul him in and get the thing over with? She can't expect to do any better."

I said that perhaps she did not want to marry him.

My employer snorted with genuine irritation.

"Want! What else are you women always wanting?" And then he added, after obviously swallowing an oath, a special courtesy I much appreciated, "Unless there is every reason why you should want it, unless you'd be some good to somebody married; then it's a fact there is no telling what fine scruples you'll set up; there's no counting —" Then, interrupting himself, he said, with a change of tone, and a return to his habitual grim rudeness of manner, a rudeness differing from that he had previously shown in this conversation, inasmuch as it put an end to interchange, "I don't like loving around the shop. I ain't going to stand much of it." And with that he began to shuffle the papers on his desk in aggressive unconsciousness of my existence.

I got some pleasure out of the familiar comedy of this dismissal and my own manner of exit, but still it gave now, as always, a little special emphasis to the distaste I felt for the down-town world, and I found myself hurrying through my battle of business in the counting-room, which was complicated by its frank, established system of small thefts from employees, that I might the sooner get home, out of this wilderness of primitive savagery modernly disguised, into a world where civilization has made a little progress. I was so glad to be in my own flat that not till after dinner did I let my mind turn back to the afternoon's incidents and inspect certain reflections which I was half conscious I had made.

I now discovered that I thought Bentley's courtship might cost more than it would come to. There had been something very sinister in Higgins's manner while making his final remarks; he had disclosed then an irritation he had masked before. I knew he would not discharge Bentley. If he had been going to do that he would never have hinted of it as a possibility; and why should he get rid of Bentley when Bentley would not care a rap, and some other paper would receive the acquisition of a highly enterprising and gifted reporter? No; it was old Martin who would suffer, and to old Martin the loss of his place would be a sadly important matter. He was past the age when men easily find new masters; he had been in the "Appeal" office a deal longer than the boss himself; he was just the kind of faithful old fixture that the boss had a temperamental tendency to oust, despite even the whisperings of self-interest, and self-interest could not be counted on for much service here—fair proof-readers are not rare.

I forgot Martin for a minute in the pleasure of contemplating the folly of the philosophers who call self-interest the dominating motive of men, seeing that proposition just then in the light of the fact that self-interest was the one principle that Higgins proposed to himself, and that he lived in a world most cunningly calculated to stiffen his adherence to it, and that yet his whims, whims for showing his authority, for humiliating those who seemed to be living independent of his permission, for expressing his inconsistent dislike of low-toned temperaments, even, as I have before pointed out, for indulging occasionally in the exercise of the forbidden decencies of his nature—all these caprices, and others, frequently swerved him from the straight and simple course that he proposed to himself; then I came back to the point that was making itself clear—that I could not bear to think of poor old Martin getting into trouble. At last, not being able to rid myself of this uneasiness by the obvious consideration that it was none of my business, I sat down and wrote a succinct statement of my conversation with Higgins and of my fears to Bentley, concluding with a piece of gratuitous advice to the effect that he had better find some way of adapting his system to the exigencies of the boss's temper, or abandon it for some less noticeable and generally irritating method of attack.

The next day he made a short call upon me.

His red hair was as aggressively upright as ever, his clothes as new, his silk hat as shiny, but still there was a drooping sadness about the whole figure of the man that these characteristic and contrasting details only emphasized.

He brought his hat into my little drawing-room and deposited it with absent-minded au-

tomatic caution well under one corner of the sofa on which he sat.

He could hardly force himself from the contemplation of his own woes long enough to ask me mechanically:

"How 's your game l—— foot?" Bentley had his own ideas of the proprieties, and he did not even affect to listen to my reply. "Bet I 'm dished," he said, with a tragic note in his voice. After a pause he went on: "I 've got to cut loose from the system, and without that I ain't got no self-confidence—I ain't got no self-confidence," he repeated with abstracted solemnity.

I looked up to catch the conscious twinkle that I involuntarily expected after this unprecedented statement, but it was not forthcoming. In the stress of this hour Bentley felt that he had come upon a disheartening lack in his nature. "The system ain't fazed her not a nickel's worth. She 's just where she was six weeks ago."

"Maybe not," I ventured.

"Aw, yes, she is; she ain't a second Sarah Bernhardt." A moment's silence, and then he went gloomily on: "I 've out with it to old Martin, and now I 'm going to out with it to her, sink or swim. I swore old Martin to secrecy, and I guess he 's been all right there; he seemed too ashamed to be likely to talk about it."

"Did he, did he really?" I exclaimed, laughing with the pleasure of coming on this phase of Martin, and forgetful for the moment of my sympathy with Bentley. "Tell me about it."

Bentley gave me a look in which vague reproach and vague sympathy mingled; he too in his way had an artistic enjoyment of life, and before he realized that he was descending from the pedestal where he and sorrow sat, he found himself telling how Martin was not up to the ancient honorable methods, and felt as shy as if some one were proposing marriage to himself. "At last," said Bentley, "he piped his eye and said he had a large family, but he never could bear to have Linnie—that 's its little name—think he wanted to get rid of her. He seemed to think, if I was doing the ancient honorable so far, I 'd be sure to go the whole animal, and want my bride whether she wanted me or not. I told him I was n't ancient and honorable to that extent. I drew the line at the girl; I 'd court her if he pleased entirely for myself, and she and I would settle things between us. I was only showing him my hand, not asking any help in the game. I was glad I spoke to him, because for one thing it showed—well, for several reasons, though she couldn't ever have been spoiled and made like some, anyhow. Much good it all is to me," he went on dejectedly, "when she dissembles her love

and kicks me down-stairs." He looked gloomily far out of the window and over the chimney tops.

He had passed the light-hearted stage in which he liked to characterize the girl he loved in the names he gave her, and in his depression was taking refuge with all mankind in the significant pronoun.

I was moved to apologize for having added to his perplexities. He waved me aside. "O cracky, I don't want to lose old Martin his place, and I bet you 're right about it. That old"—Bentley paused and drew two long dashes in the air—"he's capable of anything; besides," his voice sinking to a graver note, "I'd 'bout made up my mind to take the jump anyhow. It's just as well. The system's broken down. I never thought she caved in a hair's-breadth but once, and I guess I was wrong then. Anyhow, she never did it again, and one swallow don't make a summer. Good-by; I might as well go."

He began to look for his hat in a preoccupied way. I got it from under the sofa for him, and he left.

Two days later I received this telegram:

The country saved.

B. BENTLEY.

This was followed by a note asking me to let him bring "his girl" up to see me. I doubted whether Linnie Martin cared as much to come as he cared to have her, but her father and I had always been good friends,—that is, we had always taken particular pains to be civil to each other and to exchange confidences about the weather when, as might happen twice a month, our paths crossed,—so I hoped this would in some measure neutralize the dislike of me that the recital of my amiable influence upon her destiny would naturally inspire.

Bentley brought her to the flat very soon, staying only a few minutes himself, but taking pains to assure me that the office was perfectly in the dark as to the outcome of his courtship, and that all the affectation of indifference could do was being done to soothe Mr. Higgins. "That is," said Bentley, pointing with his thumb, "she's doing just like she always did, and I'm doing just like her." Next week, he said, she would leave the office.

Bentley wore a new aspect; there were, though my report of the interview so far may not show it, touches of dignity and deference and reticence in his manner and expression that, though they did not change his familiar guise or tone to a casual glance or a half-listening ear, were novel and pleasing to an acuter observation.

He soon declared that he must go out to "see a man," and said he would come back for Lin-

nie in half an hour. He came to me and, with a speaking gaze charged with confidential communications, wrung my hand till he brought tears to my eyes and to his own. He made it clear that he was giving me the glory of his success—an honor to which I had not the least claim; but I understood the state of mind in which it pleased him to lavish his welling gratitude to things in general upon some definite and tangible object.

Then he left me alone with the small woman who had been causing all this pother.

You could see in every line of her attitude and in every detail of her neat, appropriate gown and jacket and hat what an example of the discreet virtues and the pleasing proprieties she was born to be.

I gazed upon her with appreciative admiration mingled with fear, for I was not inspired with the greatest confidence in her powers of conversation, though she had gotten through her greetings nicely enough. I did her injustice: she was entertaining; despite all her innate sense of propriety and reserve she was sufficiently moved by her engagement to want to talk about it and "him," and this state of mind always may be confidently counted upon to furnish entertainment of one kind or another.

She first said, prettily, that Mr. Bentley had told her how kind I had been in thinking about her father. "It would be awful bad for pa to lose his place," she said, and I must explain that the written words do much injustice to the effect of her soft speech. "I think it will be better for me to stop going there as soon as I can, and then Mr. Higgins—if he don't see me to remind him—he'll forget all about—about what he did n't like." And she looked down, and carefully measured off small sections of her pocket-handkerchief, and flushed a little.

I was struck with her comprehension of Higgins's childishness, typical hard-headed business potentate that he was, and said so.

Her color rose and faded a time or two before she said, as she measured her handkerchief yet more scrupulously:

"Mr. Bentley says you were very kind to him, that you helped him get that—that desk." And she looked up with a slight, shy smile.

Yes, I said; I thought I knew Mr. Bentley's designs some time before she did. I began to see that it would be like stopping a process of nature to take her away from this subject.

"I did n't know them till two days ago," she said, looking attentively at the toes of the boots crossed in front of her, and as if she had more in her mind than she was saying. I waited. "I felt—I don't know how."

"Did you fall in love at first sight too, as Mr. Bentley did?"

She shook her head in silence. "No'm," she said after a moment; "I thought he was the—the plainest gentleman in the office when I first went there, though of course"—raising her voice a little—"I could see he was very *fine*-looking; but I did n't know how smart he was then, and how everybody thought of him. That is n't what makes me care for him though," she added quickly.

"Well, now," I asked judicially, "what does make you care for him? That will be very interesting to hear."

This scientific method of inquiry seemed to suit her own sense of the serious value of the investigation. She turned her head on one side, and looked at me with an expression of intent intellectual preoccupation, as a pigeon might look if it gave its mind to mathematics.

"I don't think I can tell exactly," she said at last, with an inflection that recognized the

mystery and novelty of this inability. "At least," she went on painstakingly and slowly—"of course, I ought to care for him, when he's so—so nice, but I don't know as I can tell just what made me think about it first, only he acted so queer. Sometimes for a long time—" She stopped, cogitated, then went on. "Sometimes it seemed as if he felt one way, and sometimes as if he did n't; that made me think about him at first, I suppose, and then he just went on acting queer all the time."

The system—was not this a disclosure that the system had done its work after all?

"And you went on thinking about him more and more," I said. "Mr. Bentley did not think you thought about him at all."

"He don't think so now," said Linnie Martin. "I did n't care for him—much—till—until he asked me, and I don't think gentlemen ought to know—ought to know everything."

Viola Roseboro'.

THE DISCONTENT OF THE FARMER.

WHAT means the groundswell that is moving the rural population? Discontent may be either a signal of distress or a sign of progress. The American farmer is not uninfluenced by the educational forces of the present day. He is aware that he stands at the front in the work of clothing and feeding the world, aided by broad acres of fertile soil, bright suns, the highest skill and ingenuity in agricultural implements, and the results of scientific investigation in experiment stations. Producing half of the world's cotton, three-fourths of its maize, and standing far in the lead of other countries in the production of meats and other food, he feels that he is not only a good liver but a liberal provider for the needs of other lands, and fairly entitled to the proceeds of the sales from his well-stocked garner. He does not begrudge a reasonable allowance to the carrier and the purveyor, but is determined to hold the remainder in his own right. He is more inclined to an attitude of protest against injustice than to a quiescent state of discontent. He is not now posing as a crushed and injured cultivator, but rather as a yeoman entitled to equity and equality in the distribution of the rewards of industry. This is his honest intent, his earnest determination, whatever crudeness the critics may find in his methods. The present ebullition, therefore, in its origin and incipency is a healthful indication, and not a sign of decadence; an assurance of life and

progress; an assertion of manly independence; an awakening to the responsibilities of citizenship; and an assumption of the action and influence that pertain to it. If folly and imprudence shall characterize such action, injury to cause and class will result. But the representative of American agriculture, it is hoped, will be too wise to meet injury with injustice, or to claim favors in opposing favoritism.

Large bodies are difficult to move. The causes of the present movement began to operate in the distant past, growing in importance with the growth of the country, the development of its industries, the evolution of its civilization. The precipitating influence that gathered the forces of disruption for an outbreak was the severe depression of prices, which found its lowest level last year. This was a sort of "last straw." It affected grain and meats and some other products, but not cotton. The lowest price of the wheat of the world for a century had been recorded in Liverpool. The purchase of wheat in India with silver, and its sale in England for gold, gave an advantage to the eastern empire which brought out all its surplus grain. Railroad extension and enlargement of steamship facilities had brought out hidden reserves in Russia, India, South America, Algeria, and elsewhere, and dumped them with unexampled promptness into European storage, surprising the commercial world with abundance almost unaccountable. No matter how short the world's production, commercial buyers give the fact no visible recognition until a shortage

appears in visible stocks. Our own farmers helped to reduce prices by swelling home production of these staples, so that our contribution of nearly five hundred million bushels of wheat (in 1889), and more than four times as much of corn, broke down the markets, and intensified the disgust of growers with the agricultural status. Last year's over-production of cotton reduced also the price of that staple, increasing the gathering discontent of the South. Thus culminated the influences of depression, and aroused into violent activity the discontents, the dissatisfactions, and in some cases the prejudices of farmers generally. Then began the search for causes and remedies, and the organization to formulate and forward remedial measures.

The most impulsive and aggressive sought relief mainly in political action, in increase of monetary circulation, destruction of national banks, free coinage of silver, the issue of bonds at a nominal interest on security of crops and lands, and similar measures for cheapening money and making it abundant in every man's pocket not after the manner recommended by Franklin. Another large class, more conservative, favored some increase of currency, a larger coinage of silver under regulations consistent with a parity in circulation of the two metals on an equitable bimetallic basis. A third class, more numerous in the Eastern and Middle States than in the West, are opposed to any inflation which shall disturb values and cheapen the quality and purchasing power of money. Thus they are by no means a unit on the money question, presenting a diversity of views difficult to harmonize, or even to understand. Dependence is had upon the educational influences of discussion and deliberation to crystallize plans which will commend themselves to the second thought of the masses.

There are those, however, among farmers, and the most progressive and enterprising of their class, who will not admit that they have any special grievances or have suffered from depression. One of these writes from the West that "the farmer who is attending to his business is as prosperous and contented, as a rule, as men in other business, and is making no complaint; that the complainer is the thriftless farmer who spends too much time in town, is ambitious for office, seeking even the little township offices, neglecting his work to attend caucuses and conventions; that many an honest complainer is led on by demagogues and place-seekers." Another influential and representative farmer in the same region says that whatever discontent exists in his State is mainly due to the short crops and low prices of the last few years; that a shrinking income makes any man or class more or less dissatisfied; that

"the great bulk of thoughtful, intelligent farmers, men who shape largely the sentiment of the communities in which they live, understand that the recent depression in prices of farm crops has been the result of natural causes; that they regarded with greater anxiety the prohibition of American pork by Germany than the accumulation of Gould's millions; that they know that there is nothing which rests with more crushing weight upon the farmer's back than his own unbusinesslike methods; and that they pay more attention to the markets than to politics, and their principal complaint is that the present system of education and state of public sentiment toward farm life is such that the cream of American youth is skimmed into other professions." A prominent Kansas representative of the agricultural class refers to the recent magnificent harvests and the improved state of feeling, declaring in somewhat abrupt and vigorous terms that "discontents and demagogues find it hard work to howl into the mouth of a cornucopia." These references, of which a multitude could be given, show that there is no absolute unanimity in any section relative to the grievances suffered or the remedies proposed. As the present purpose is to give the facts as they exist, and to show with absolute accuracy, if only in outline, the main features of this remarkable popular manifestation, these conflicting views are presented.

While the gradual reduction and extreme depression of prices gathered and intensified the public discontent, the restoration of satisfactory values modifies but does not dissipate it. In the primary markets corn and oats have doubled in value, and wheat and meats have materially advanced, though cotton, as a marked exception, has declined. It can doubtless be shown that, on the basis of the present average values of farm products and of manufactured goods, a day's labor in production has a higher power in the purchase of what the farmer needs, at the present time, than at any former period in the history of the country. This is not because of extraordinary farm prices, though values are "medium to good," but because a day's labor with present appliances produces more than ever before, and also because of the cheapening of the value of nearly all manufactured goods. Few realize the extent of this reduction in fifty years, and especially since the days of household manufactures. A recent opportunity to examine a day-book of a country merchant of 1817 in Webster, New Hampshire (a locality within an hour's ride of the birth-place of the great statesman), showed that the farmers of that region paid fifty cents per yard for calico, sixty for cambric, seventy-five cents per pound for cotton yarn, thirteen cents for a

single nutmeg, and sixty-seven cents for a common garden-hoe, while they sold veal at three cents per pound, and farm wages were one third of the present rate.

A return to reasonable prices is a relief to the farmer, but it does not settle the vexed questions that have disturbed his equanimity in the past, in which he believes are involved in no small degree the equities of profit-sharing in the industries and the prosperity of his future. An analysis here of the permanent grievances from which he seeks relief will include those of the most importance, and indicate those most influential in certain geographical districts.

The assumed causes of discontent are industrial, social, financial, and political. They are more numerous and aggravated in one geographical district than in another. In some States large numbers of farmers are unaware of the existence of any serious grievances; in some other States the rural classes are in a state of active ferment. In the former the orators of agitation encounter apathy; in the latter the public ear is alert, the public mind receptive, the public heart ablaze. While these differences, which sometimes amount to contrasts, characterize in some degree large districts, there is much of differentiation in the mass of individuals of each. The farmer who is successful makes little search for grievances, and gives less thought to oppressive ills. He who suffers loss and incurs debt, whether from misfortune or miscalculation, is inclined to look outside for the adverse influences which blight his enterprises. They may exist unobserved in one case, and be very real and oppressive in the other.

The spirit of unrest has its largest manifestation in those districts in which nature has recently been most capricious and unkind, where the sun's rays have scorched and rains have been withheld, where enthusiastic endeavor has been met by crop disaster, and poverty, ambitious to build a home, has been beaten by climatic weapons. Under such circumstances the burden of debt is a crushing weight, the effort for relief a financial nightmare, and the contact with greed a revelation of the depth of human depravity. In such an atmosphere of suspicion ills are magnified, the good in society becomes evil by the distortion of refraction, "whatever is, is" wrong, and reform is made to mean abolition of existing laws and institutions. The realization of current evils is intense, the effort to combat them is honest, and the result, as the thunder-storm clears the atmosphere with a minimum of destruction, promises to be purification without annihilation. Here industrial grievances lead to remedial effort through financial and political changes.

In another large division of national territory social and political causes, inducing industrial and financial disability, have been prominent factors of the prevailing dissatisfaction and depression. It is an area rich in resources of field and forest, mine and quarry, with an abundant rainfall and a mild and salubrious climate. In former days it was limited by slavery to agricultural exploitation, to a single money crop, and therefore to a sparse population. For a brief period cotton brought prosperity to the small class of plantation proprietors; but no one crop that ever grew in any country can suffice to enrich the millions of a teeming population. Ultimately came civil war, destruction of life and property, abolition of slavery, and radical changes in industrial methods and crop distribution. Society and industry were in chaotic condition; but declining to yield for a moment to despondency or despair, the people hopefully and bravely started on a career of development in many lines, with energy and persistence which have brought already a large measure of success. Roads, bridges, railways, factories, houses, furniture, and other forms of wealth, the product of labor, have been mainly created in this region within a quarter of a century.

Starting virtually to build anew the appliances of civilization, and urged by a noble ambition to compliance with the demands of progress, it is not strange that the advanced development and wealth of other States should excite some dissatisfaction with existing conditions. In the outset, with small industrial income except from agriculture, isolated from markets, without means of transportation, remote from great commercial and financial centers, deficient in banking facilities, the difficulties environing distribution and exchange were enough to have paralyzed effort for production in the case of any people less resolute and persistent. With all the growth of recent years, in these and other directions, complaints are still numerous of the burden of transportation, inadequate circulation of currency, and scarcity of money for defraying the cost of production and distribution, leading to demands for larger banking capital and increase of national circulation of currency.

Another cause intensifies the desire for more aid and cheaper money. From time immemorial a large contingent of the class of cotton-growers have been in debt. The land has not generally been mortgaged, but the crop, more valuable and a far more available security, has been held for the cost of advances and supplies through the growing year. A system of credits running from New Year's to Christmas, and often extending into the next crop year, was in vogue a half century ago, and has been con-

tinued to the present day, though the State agents and county correspondents of the United States Department of Agriculture declare the gradual reduction of this pernicious form of debt, far more oppressive and destructive to enterprise than permanent land mortgage. This indebtedness has carried an enormous interest, disguised in supplies of merchandise charged at a large advance upon cash prices. With an increasing degree of independence, and gradual advance in economic education, there is a strong determination to throw off a burden so unendurable, and hence arises the general demand for more available money at a low rate of interest. The sub-treasury plan of the Alliance is a form of crop mortgage by the government, at two per cent. instead of ten to twenty, naturally growing out of the prevalent and ancient custom of crop liens, and therefore more popular even than a government land mortgage.

In the northern seaboard States there is comparatively little discontent among the rural classes. The newer organizations, so numerous in other sections, have scarcely a foothold in this part of the country. The Grange here is still popular, and usually active in the work of advancing the social, economic, and intellectual status of farmers. The financial schemes proposed elsewhere meet with little favor and are generally opposed. The more enterprising are doing well in dairying, fruit-growing, and market-gardening, and are giving little attention to grievances. There is, however, dissatisfaction, more or less general, with unequal taxation, by which farmers bear public burdens quite disproportionate to their share of the general wealth. They complain of the comparative exemption of personal wealth, including railway property, and of discriminations in favor of manufacturers, and of the double tax on indebtedness represented by mortgages. They are beginning to object to the exemption of taxation on large values of real property owned by religious and charitable organizations; and are keenly alive to the injustice advocated by many in cities, of concentrating all taxation upon farms and town lots, that the increasing proportion of personal wealth, the bulk of the property of millionaires, may escape taxation altogether.

A very general sense of injury is felt in the East in relation to what is called Western competition, which has rendered unprofitable the production of cereals, of meats and some other products, and has compelled a change of rural industries in the direction of perishable products. Those not sufficiently alert to adapt their enterprises to changing conditions have suffered, and are now suffering and complaining. Many are inclined to inquire into the causes of this

competition, and to deplore the old-time policy of giving Western lands to foreign as well as to native settlers, and especially that which enables wealth to monopolize the best lands at nominal prices, and the encouragement of railroad extension by loans sufficient to build the roads and land grants worth as much more. They are opposed to the encouragement by the Government of the settlement of large tracts of land in the distant West, and to aid in fitting for cultivation the arid areas, to increase the competition which is already serious. Incidental to this question come in the discriminations of railroad transportation, the unjust disparity between the rate for the long and that for the short haul, and the rebates and special contracts by which favored operators can crowd the multitude of freighters off the track. They object to favoritism, by the Government or by railroads, through which their business is made unprofitable, injustice is encouraged, and individual fortunes built up at the expense of the great masses of producers and consumers. They deplore especially the loss of the local demand for beef, formerly a source of income to the farm, which, as they claim, is caused not merely by the abundance of the Western product and the cheapness of transportation, but by combination to control the markets and buy off or starve out local competition. The extensive operations in feeding, both for beef and mutton, once so prosperous in the Connecticut Valley, in western New York, and in eastern Pennsylvania, are now scarcely more than a memory of a former rural industry. They deem it a sufficient hardship to suffer a competition, not merely incidental to national development and railway extension, but fostered by legislative policy, without enduring further outrage from a grinding monopoly. The natural and inevitable changes in industry and trade are regarded as misfortune; the combinations of individuals to control such changes for private emolument are declared a crime.

The farmers of the Ohio Valley are generally prosperous and measurably contented, yet the topics under present discussion command their attention and divide opinion. A prominent grievance in their discussions is taxation of both real and personal property without deduction for indebtedness, or double taxation. The demand for lower rates of transportation of farm products, especially for the short haul, is general; they acknowledge that the rate cannot justly be the same in proportion to mileage as for long distances, but believe that the difference is measurably due to the assumed rule of charging all that the traffic will bear, and not to any established principle of equity. The opposition to trusts, pools, and combinations is gen-

eral and determined, as is the belief that it is the duty of the Government to interpose for the protection of the community. The farmers of this region, quite generally, if not so unanimously and persistently as in the South and more distant West, regard prevailing rates of interest, established when money was dearer than at present, as too high, and favor an equitable reduction in consonance with current rates at the present time in great commercial centers.

Complaints are neither numerous nor loud on the Pacific Slope. Prosperity is so general there, in agricultural circles, that the list of grievances canvassed is short. In California the most prominent disability, which many farmers are anxious to remove, is excessive cost of transportation. The citrus fruits, grapes of European varieties, fresh and in the form of raisins and wine, prunes, olives, figs, and nuts are produced largely beyond the home requirement, and sent to all parts of the United States, displacing foreign fruits, having little competition, except in the citrus family, from any other part of this country. Ten years ago a car-load on the fast-freight line cost eight hundred dollars to Chicago. A great reduction has followed, but the expense of transportation is still a great burden, from which fruit-growers seek to be relieved; and to this end, they welcome the prospect of a Nicaragua canal, and hope for new lines to the East, or for competition of old lines. Many, despairing of relief otherwise, favor control or ownership of railroads by the Government. They also feel aggrieved at the delays occurring in transportation of perishable products, by which heavy losses frequently, and great uncertainty always, discourage and injure the trade. Oregon has as yet a smaller interest in rapid transit across the continent, and her farmers are less exercised relative to a solution of railway problems.

The grievance next in importance on the Pacific Coast is the crowding of the ranks of the middlemen, their grasping for a larger share of the values handled, their scheming and combination for increase of the cost of marketing, by which the growers' prices are depressed and rendered unremunerative. The remedy proposed for this is coöperation to eliminate as much as possible of the unnecessary intermediary service and superfluous charges. The plan is in operation in the sale of fruits, and judicious selection of agents, it is claimed, has already proved its wisdom. It is proposed to initiate similar methods for handling other products.

There is complaint by grape-growers and orchardists of excessive local taxation, especially of plantations of young vines and fruit-trees not yet in bearing, while still a heavy

expense to the cultivators, and not producing a cent of income. The wine-men complain of taxation, not merely on the gallon of wine made, but on the vines during these years of growth (that involve great expense for cultivating and pruning), claiming that it amounts really to double taxation.

The discontent of the arid region arises mainly from lack of water, and from the methods of applying and controlling it. The soil is fertile, in many districts having an excess of valuable elements of fertility. It is usually cheap; indeed, it is nearly valueless without some means of supplying the necessary moisture. Irrigation is therefore essential to agriculture. The people hold, and the States affirm, that the water belongs to the State and goes with the land; that it cannot be seized by individual or corporation, monopolized and doled out to cultivators for a price. As the land is mostly owned by the United States Government, and conveyed free to individuals through land laws not suited to the needs and exigencies of the arid region, it is held to be for the public good to cede the land to the States, to enable them to construct reservoirs and canals and control the water-supply for the best good of all settlers. It is claimed that in districts in which settlement has been long in progress, land in irrigable contiguity to streams has already been taken up under existing laws, and that little remains that will not require expensive reclamation, impossible to individuals, and practicable only as a work of the State or the General Government. Therefore they claim that the Government should construct the reservoirs and regulate the distribution, or else surrender the public lands to the States. A plan favored by many is the cession of these lands to the States, and the application of the proceeds of their sale to the construction of mountain reservoirs and canals; and the fear is expressed that a continuance of the present policy will greatly delay development necessary to the support of the present local population, and to progress in other industries in all this great mountain-region.

Coming to causes of complaint that are general rather than local, and that operate without reference to fluctuations of product or price, the railway issue is perhaps most prominent. Farmers realize their dependence upon the railroad as a highway to their markets, while objecting to submission to the power of the highwayman. They have often voted municipal and county stock subscriptions to obtain them, and have usually seen them rendered worthless by a blanket of preferred mortgage-bonds to complete or equip them. In some instances enthusiasm and inexperience have understated the estimate of cost; in others reck-

lessness and misrepresentation have made a beginning without care or thought for a practicable completion; the result is the same to the public investment—it is lost. In the arid regions, without crops or people, roads have been extended, even paralleled, not by aid of local money, which may not exist, but by funds from the East and from Europe. It is held and believed that in many instances this money is turned over to construction companies who make large profits on small mileage, and when assessments cease a new deal is made, new bonds printed, perhaps a new directory is established. The transformations of railroad property, after contractors and wreckers have done their worst, surpass the tricks of legerdemain. It is even charged that the roads built by subsidy, and further endowed by lands, have been swamped by *crédits mobiliers* and bad management, while promoters and contractors, who have built competing roads without subsidy, have prospered. Whatever truth there is in this allegation of the farmers, they find ground for suspicion in the fact that the roads are poor while the builders are rich. By counting values sunk by plunder, profits to promoters of new deals, and losses by reckless management, the ultimate capitalization is enormous, and also largely fictitious; and farmers naturally object to transportation rates levied to make interest on watered stock. It is unfortunate that so many trades and professions seem essential to railroad building; the promoter, the surveyor, the stock-subscriber, the foreign bondholder, the contractor, the wrecker, the sheriff, and a new company to try to make running expenses and satisfactory profits by charging "all the traffic will bear." This is the picture drawn by many a farmer who has lost his stock-subscription, and is still taxed to pay that of his county.

But he has more direct and personal objections to prevailing railway management, on account of alleged unjust discriminations in rates. He avers that it sometimes costs nearly or quite as much to send his products to a near market as to the seaboard; that rates are higher where there is no competition; that a neighbor gets a lower tariff than he can obtain for himself; and that great monopolists virtually make their own terms. He makes similar charges against express companies, protesting that the service bears no proper comparison to cost and produces inordinate profits, to the enrichment of the company, at the expense of the producer and consumer.

For a remedy some favor a more thorough and persistent attempt to regulate interstate traffic by the Government, and to eliminate local abuses by State action; while others favor the Government ownership of railroads

and express lines. Apparently much the larger number are found in the former class.

Competition in railroad construction, instead of cheapening the cost of transportation, appears to have the effect of increasing it. New roads are built, parallel with paying lines, not because of local demand, but with the intention of forcing the prosperous corporations to purchase immunity from persecution at a cost of a heavy bonus above expenses of construction. The price of franchise and construction, blackmail and all, is then capitalized, and the public is taxed in perpetuity to pay interest, through increased freight charges, on the fruits of such cupidity. Eastern owners of Western lands are approached by railroad projectors, and plied with all the arts of rhetoric and the seductive creations of imagination to forecast the golden advantages of a road through their realty. Journeys to Europe are taken to impress Dutch burghers and English lords who represent land syndicates in this country with the necessity and advantage of similar measures for development of their property. Scheming for railway extension has many similar manifestations, from various motives, including too frequently the expectation of personal commissions and profits, with small consideration of the public need or the general welfare. Thus has grown up the profession of railroad projectors, whose efforts have had large influence in the construction of about 170,000 miles of American railroads, and in the extension of mileage of about 13,000 miles in a single year, equal to nearly the entire railway mileage of the empire of India. It may gratify national vanity to be able to claim for the United States half of the railways of the world, but such a gratification may involve a waste of capital and prove an injury to producers who are taxed to pay interest upon it. It is inevitable, under existing conditions, that such waste and plunder will be added to the cost of construction and equipment, become capitalized, and be made the basis of freight tariffs. A way is thus opened to the pockets of the people by which the railway capitalist can recoup himself for these liberal allowances to his friends the projectors and reorganizers.

The farmers acknowledge the helpfulness, the actual necessity of a healthful extension of railroads, and admit that in some local districts there is now need of further mileage, while deploring the artifices and frauds of purely selfish schemes of extension, and the abuses which greed enacts to enlarge profits on fictitious capital. They do not arraign all railway management as oppressive and corrupt, but find abundant evidences that remediable abuses exist and that reform is necessary. They are willing to acknowledge that freight rates have been

greatly reduced during the last twenty years, whether in consequence of the agitation and legislation of the past or through the influence of competition; that rates may sometimes be lower even than the cost of carriage, especially in cutting rates by roads competing for the long haul. Instead of proving an advantage to freighters, the fluctuations incident to such a course are disturbing influences in trade, and the discriminations involved in them work inequality in dealings with individual shippers. The claim, even if true, that competition, better than legislation, will make just freight tariffs, does not meet the objections here transcribed; it is discrimination, tergiversation, favoritism, individual injustice, that are deplored and condemned, far more than the average rates of compensation demanded by the service.

Another cause of injury to agriculture which is universally recognized is found in the exactions of the middlemen, a class necessary and useful, but swollen needlessly, until forced by pressure of competition either to a scanty subsistence or combination to prey on both producer and consumer. The farmer is appalled to see the long line of intermediaries who pass his produce from hand to hand, over continents and seas, each taking his toll, until little of the ultimate value is left to the grower. They are legion in numbers, in forms of pretended service, with hearts beating in unison for the appropriation of the largest possible share of the values handled. These organizations are manifold; they are associated in trade guilds, societies, exchanges, and boards of trade; they are known individually as commission men, brokers, forwarders, jobbers, retail dealers, hucksters, and peddlers; an army of men who produce nothing, and yet aspire to own everything. Their service, so far as it facilitates distribution and exchange, is recognized as legitimate and useful; yet they are too many in number, and too greedy in spirit, taking more for their share than the service is worth, and using their advantage of proximity and opportunity for close business association to depress prices in buying and advance them in selling.

In the marketing of perishable products the producer finds himself in a position almost helpless. The goods cannot be withheld, and are ever at the mercy of the buyer. If there is a glut for a single day, though the crop may be poor, prices are depressed. If then the grower waits a little for a better market, the dealer sells his cheap purchase at a dear rate. The prices of vegetables, as reported by farmers, are often only half, sometimes a third, of the prices obtained by retailers. The dealers often get as much, perhaps in a single day, for selling a load of vegetables, as the grower obtains for his season's work in producing them, in-

cluding the cost of seed and the expense of marketing. If fruits are abundant, almost equal disparity obtains between farmers' and hucksters' prices; if scarce, a smaller profit may become a necessity. In case of positive glut the grower gets little, while combination holds up the price to consumers, even at the risk of dumping the remnant as garbage. It is claimed that the poorer portion of shipments of fruit have sometimes been destroyed in large cities, to give value to the remainder, and save the demoralization of the market—in other words, to prevent the enjoyment by the poor of fruit-supplies at nominal rates.

In the retail trade, in public markets, and in greengrocers' shops and hucksters' stands the same methods prevail, and the maxim "buy cheap and sell dear" is the golden rule of the gild. Besides combinations and tacit agreements in regulation of diurnal prices, there are various expedients and devices to secure larger profits. One of the most unfair and oppressive of these is the excessive percentage of extra profit charged in small sales. The huckster lies in wait for poverty, that must buy in small quantity, and levies differential rates in proportion to inability; for instance, 75 cents for a bushel, 40 for a half bushel, 25 for a peck, and 15 for a half peck, while for a quarter 10 cents may be demanded, making an extra profit for smallest sales of more than 100 per cent. by so minute a subdivision for the convenience of penury. The widow trying to eke out a meager subsistence by keeping boarders, compelled to buy in small parcels, is thus charged 10, 20, 50 per cent. or more for her disability. She is taxed daily a much larger percentage on a dollar than the capitalist can obtain for a year's use of his money. This unjust discrimination, which is very common in many places, has no possible excuse, its only motive being a larger exaction. There are equitable differences, it is true, between a sale by the car-load and by the peck, which are made solely by the increased cost of handling; but this element of difference in the ordinary distribution into market-baskets is almost infinitesimal, quite too trivial to become the excuse for doubling the ordinary profits of retailing.

Another imposition on the consumer which reacts on the producer, tending to widen the margin of profit of the retailer, is the practice of selling the finer cuts of beef at the same rates for different qualities, whether taken from "choice" or "medium" grades, the difference in cost being at least 25 per cent. It is based on the opportunity afforded by the ignorance or carelessness of a considerable class of buyers who fail to discriminate as to quality. The more conscientious retailers who deal in

meat of first quality are injured by this practice, as well as consumers.

The outcry against monopoly in the meat-trade is loud and bitter, and general in all the densely populated districts in the country. It is made by the rancher on the plains, the farmers of the central West and those of the East. The former complains that it controls the price of the product, the latter that it intensifies the natural competition of the great pastoral region. It is well understood that it can handle the meat-business, by system, by division of labor, by extreme utilization of by-products, and by special and reduced railroad rates, at less cost than by a multitude of individuals; but there is no confidence that it will give this advantage either to producers or consumers of meat, or even share it with them. On the contrary, it is feared that in the future, as producers and consumers believe has been done in the past, monopoly will appropriate the results of any economy of management for its own use and emolument, that it will crowd out all competition, perhaps by methods questionable and highly injurious to individuals. They therefore call on the Government for protection, in some practicable form, against the operations of this and all similar combinations to control the value and the distribution of farm-products.

Milk furnishes a notable example of the exactions of middlemen. Without reference to adulteration and sophistication by positively dishonest purveyors, the skimming to increase the specific gravity and the adding of water to restore the average, and the more disgusting products which simulate pure milk, the share of proceeds demanded for transportation and delivery are inordinate and unjust. The price paid to farmers varies with distance from market, but the average is very low, ranging from less than 2 cents to 3 or $3\frac{1}{2}$ cents per quart, while the consumer pays 5 or 6 cents in smaller towns, and 8 cents, sometimes 10 and 12, in the principal cities. The transportation rates are generally high, and the delivery service equally so, while the dairyman, for his land, animals, daily care and labor, gets a pittance of the gross returns, sometimes a third, and rarely under favorable circumstances a half. He insists, with due regard to the greater cost of living and labor in cities, that his share for production is inequitable and entirely insufficient. In a few communities remedial measures have been initiated, in some form of coöperative association, by which the exactions of the middlemen are eliminated and the services of distribution are placed on a par with those of production. The only limitation to the full success of these arrangements is the inexperience of agents acting in unaccustomed

lines of effort. The degree of success attained proves the inequality and injustice of the old system, and the reasonableness of the producers' contention.

There is much complaint in the West and South, in the domain of cereals and cotton, and also more or less in other sections of the country, of the influence of trading in futures upon prices of products. It is generally believed to be highly injurious to the producer. While it is recognized that there are "bears" as well as "bulls" in the wheat and cotton "pits," it is known that the dealers in these games of chance live and thrive only by fluctuations; and that the deeper the sensation, the more frequent the "bulges" and "breaks," the better the show for profit (and loss) of individuals. This variation in quotations of futures, it is held, must affect "spot" prices somewhat, and whatever fluctuation is caused by it is undoubtedly injurious to the interests of primary holders. They are distant from market, and cannot respond instantly to these changes. The city dealer in actual grain or other products reaps the advantages of fluctuations, and the grower inevitably loses by them. Besides, the farmer is naturally opposed to a non-producer, who does not even handle or forward his products, "who toils not, neither does he spin," while yet arrayed in habiliments to the fashion of which Solomon could not aspire. He who plows and sows, and by the sweat of his face reaps his wheat, does not recognize as his associates in the production and distribution of wheat, or as entitled to any share in the profits and emoluments of the trade, those who convene daily to bet upon the price of wheat at some-future day. He deprecates the spirit of gambling which pervades business circles, the desire to obtain something for nothing, to get that which others must lose, to gain, without equivalent, wealth that others have labored hard to produce.

Agricultural indebtedness invites much discussion. In certain districts, where drought has destroyed successive crops, bankruptcy and foreclosure have been imminent. Here it is the "visitation of God" that foreshadows the visit of the evicting officer. Debt, like death, has been and ever will be with us. It is sometimes a crushing burden, and often a blessing on which enterprise finds a home. Farmers' debts have been recklessly exaggerated and their purport misrepresented. Debt is incurred to buy more land, for building, fencing, and other improvements. In the Ohio Valley and in the East much of it occurs in division of estates, by retirement of aged farmers in favor of a son or an enterprising farm laborer. In such cases debt is merely nominal as simply a convenience. The past year has

been notably one of debt-paying by farmers, and the volume of agricultural indebtedness has been much diminished.

In the South and in some of the States of the extreme West there are complaints against the tariff, some opposing its protective features and favoring its reduction to a revenue basis, in the belief that farmers are discriminated against under this indirect form of taxation; others, while opposing the principle, are willing to favor a scheme of incidental protection for the sake of present revenue. There are also those in the same regions, though fewer in numbers in agriculture than in other industries, who claim that this form of raising revenue is doing more to render agriculture prosperous than any other agency, diverting laborers to other industrial fields, exploiting mines, and building and running factories, which furnish markets for rural products and relieve the tendency to over-production. In nearly all the remaining States there is a general silence on the subject, broken only by an infrequent demand for reduction of duties on one side, and on the other for still higher duties on certain products of agriculture, while admitting that the farmer of the present time shares more equally in the benefits of the prevailing protective policy than ever before in the history of the country.

Reference has been made, in the paragraphs relating to complaints and demands of the South, to the Government loan measure, which next to free coinage appears to be the most urgently sought political concession from legislative authority. Its advocacy is not confined to the South, but appears in Kansas, in Missouri, and less generally in the Dakotas, Iowa, and Minnesota. Nowhere is there unanimity relative to the measure, and there is sharp division in the States in which it meets the largest degree of favor. It secures the favorable consideration of a few farmers of the central West, and practically none in the Middle or Eastern States. There has been much uncertain characterization of it, and manifold misunderstanding of its purport. It proposes to establish "subtreasuries" or depositories of cotton, wheat, corn, and other products designated as non-perishable, on which Government notes shall be issued to the extent of eighty per cent. of their market value, which shall be a legal tender for all dues to the Government or individuals. The depositor, on return of the certificate and advance which he receives, and payment of expenses, can sell the stored product at any time within a year. This is the usual plan, which is held to be subject to modification in its minor details. It is claimed that precedents exist for such a measure. It is likewise proposed that the National Government shall grant loans on real estate, at a similar rate

of interest. The demand is in the following terms:

We demand that the Government shall establish subtreasuries or depositories in the several States, which shall loan money direct to the people at a low rate of interest, not to exceed two per cent. per annum, on non-perishable farm-products, and also upon real estate, with proper limitations upon the quantity of land and amount of money.

In response to the suggestion that other industries would demand a similar public loan, and when confronted with a quotation of the favorite political maxim of farmers' organizations, "special privileges to none," there is no answer except that of the President of the Alliance: "Then take away the special privileges you have accorded to the manufacturer, the ship-builder, and the banker."

Farmers of thoughtfulness and acumen realize as the cause and basis of most of these evils, and of others not here enumerated, the disposition so prevalent among all classes to live without work, "to live by their wits." The numbers living by speculation are large in every city. There is no form of property, personal or real, that escapes their attention. In real estate, city lots, suburban acres, mill sites, water privileges; in country realty, farms, forests, orchards, and gardens; mining properties, quarries, petroleum-wells, natural gas; in personal property, shares and bonds in railroads, banks, gas- and electric-light works, patents and manufacturing plants; in these and in a multitude of schemes impossible here to enumerate, for organizing, promoting, and booming values real or imaginary, speculation is rife. Large numbers of the population are using their wits far more than their money in putting into operation and officering companies and associations, printing share-certificates, issuing bonds, buying and selling securities based on small values and large expectations. There are many for management, few for active service, or for the manual labor involved in all these enterprises. They prefer trading to working, scheming to labor. In the vigorous language of the border, "by the sweat of their jaws" do they prefer to earn their living.

It is the same in real estate as in fancy stocks and financial chimeras. A farm beyond a city boundary is purchased by a syndicate of very respectable citizens, a surveyor is employed to lay out streets and lots, a draftsman to make a map, a lithographer to print it, an auctioneer to sell, while a free excursion is given and a free lunch set out. Under these incitements and excitements, a large crowd is carried out and a godly number taken in. The projectors appropriate the unearned increment of value which patient settlers may

create by hardship and persistent effort in the next ten years. The enterprise is speculative, deceptive, not to say dishonest. It is by such devices, in all the walks of business, that the city fathers amass much of the wealth they leave their children, who follow in their footsteps, avoiding and despising labor, and helping by precept and example to make a nation of idlers, tricksters, and gamblers. Such are the deliberate opinions of many of the stanch and trusty yeomen who view with alarm the building up of cities devoted in so large a measure to the plunder of the productive industries of the wealth which they have created.

In this connection reference may be made to the frequent complaint that enterprising and ambitious sons of farmers leave the paternal acres for other vocations. It is a matter for congratulation that boys do leave the farm for other pursuits, and also one for regret that the brightest are the first to go, if that is the fact. The interests of farmers in this country, especially under a régime of scientific agriculture, under which alone will profit be possible in the future, require that not more than one third of the national body of workers, including both practical and professional, shall be engaged in rural pursuits. Under present conditions a somewhat larger portion may be employed, possibly forty per cent.; if more, the tendency is to over-production; with a lower proportion agriculture will flourish, with a fair field for distribution and sale. Therefore the drift to other pursuits, even from country to town, is not in itself to be deplored, but it is deplorable when the drift is away from industrial occupation, from productive and constructive industry, toward speculative schemes, toward idleness that is active for mischief,—the present standing menace to national industry and honest manhood.

In this review of the grievances of which the farmers of the United States have complained, and are still complaining, the differentiation of discontents, by geographical districts, is first shown, and the main and more generally accepted evils are presented topically, in the lights in which they are viewed by those most interested. An opportunity, almost unexampled, of feeling the rural pulse has been improved for a fair and accurate presentation of current complaints of industrial, financial, and political disabilities of the rural class. It has been made with an honest purpose of serving the interests of truth and the welfare of agriculture. The many topics treated have necessarily been only touched lightly, and some minor grievances have not been considered. The subject is too large, the field too wide, for exhaustive treatment. The matters considered so briefly are up for discussion, in field and

forum, on the platform and in legislative halls; and the hope is expressed that the general public may see more clearly the issues presented through this lens by which they are focused on the public retina.

A philosophical view of the subject, in all its bearings, is by no means disheartening to farmers. The depression from low prices, which intensified and brought to light the extent and variety of discouragements realized, is mainly over for the present. Generally the farmer is prosperous, though he certainly fails to secure his full share in the rewards of his productive labor. He is entitled to fair consideration in such remedial measures for his protection as may be possible under our form of government.

In analysis of material coming before the writer, there have been omitted, almost entirely, the views of many of the most progressive, enterprising, and influential of the rural class, presenting as the most serious grievance the absence of effort to find remedies for existing ills in practical improvement in farm management, in coöperation to control the distribution of their products. Regrets have been expressed that the personal equation in this problem of rural reform has been omitted. Two quotations will indicate the views presented, both from the Southern States, one west of the Mississippi, as follows:

A somewhat extended experience in practical agriculture of the State and good opportunities for observation lead me to assert that farming, industriously and intelligently followed, offers as good inducements for the capital, labor, and skill expended as does any other calling in the State.

The other from the Atlantic coast:

No real practical efforts are made for relief. All the complaints made and all remedies proposed are political. Many of the former are absurd, and most of the latter will prove futile. We need smaller farms, more work, more knowledge, and less grumbling. What can be done on small tracts highly fertilized should be brought home to the people, so that the inexperienced may imitate, even before they know the reason why.

The farmers of the United States live under better conditions for progress in their art—a high standard of living, advance in personal culture and soil improvement, and pecuniary independence—than those of any other country. Aspirations for higher improvement, equitable sharing in the results of productive labor, and a full exercise of the rights of citizenship have been aroused. With wisdom in action, for political recognition, for advance in economic education, for coöperation and self-help, and for increase of practical skill and pecuniary profit, the result of this crusade will be highly beneficial to the farmers of the United States.

Author of "Two Runaways," etc.

I.

JACK.

LATE in the summer of 1873, upon a dusty roadway near a little Georgia village, a boy of sixteen years was hobbling along supporting himself upon two short sticks, without which locomotion would have been well-nigh impossible, since both his lower limbs were withered and twisted, and his feet shriveled and calloused from unnatural use. His face was pallid and pinched. Sandy hair thrust itself down from under the old bell-shaped hat to meet the swarming freckles, and his lips, drawn apart in the effort

of labored respiration, disclosed teeth yellowed and uneven. The redemption of the face from absolute savage inexpression was accomplished by a pair of keen energetic gray eyes, the only features that hinted of possibilities within. The clothing of the lad consisted of a dirty, rough, once white homespun shirt, a single homespun suspender, and a pair of ancient jean trousers rolled up half way to the knees. Slung over his shoulder was a gunny-sack, from which protruded a few pine splinters, in the South commonly called "lightwood." One freckled hand included in its grip upon the stick also the handle of a little old ax.

The boy belonged to the humble people called "crackers," the real children of the soil, who, owning no land, live upon the great estates and pass with the titles from generation to generation, from seller to purchaser. Formerly they were far from the plantation settlements, as they did not harmonize well with the slaves, nor could they mix with the gentry.

They were to be found upon the outskirts, by forests and creeks, between wood and water. The changed conditions of the South have affected them less than any other class. They know the country, the division-lines, the "blazes," and even the varieties of fruits upon the plantations where they have grown up. They are generally honest and useful in furnishing the extra labor needed when the cotton is to be chopped out and the crop picked. Their wants are few and simple.

The road ran out past the fields to where a dense thicket of small pines cast a dark shadow across it, and far into the fallow land on the other side, whence came a crooked path. Leaning on the zigzag fence, her eyes searching the accidental aisles of the pines where the sinking sun found spaces for some fine effects of lightened shadow, was a young girl, her soft white muslin and laces, her pure complexion, her delicate hands hinting of a life far removed from crackerdom. She had been gathering the blossoms of the delicate wild peas that run upon the tall grasses, and these, blue, gold, saffron, and copper, were twined about her broad straw hat. Mixed with them were the little red blooms of the "busybody" that attacks and interlaces itself hopelessly with every vine that crosses its path. A simple crimson rose was at her throat. When the boy passed the last clump of bushes he came almost opposite her, and each surveyed the other in astonishment. The girl recovered at once, and gave him a friendly smile.

"Good evening," she said. Then, seeing that he had stopped, "Are you coming across here?" The boy's wondering eyes clung to her face a few moments longer. Then he nodded his head. She drew back as he thrust his sack of lightwood upon the fence, but, seeing how difficult his crossing would be, said, renewing the friendly little smile, "Let me hold it for you." She took both ax and sack in her white hands from his unresisting grasp before he could object, and turned away a step or two, not to embarrass him in his painful climbing. When he had drawn himself over and silently reached for his burden she walked on, nodding her head gaily for him to join her.

"They are not heavy," she said, "and if you do not mind I will carry them for you. I see you are going my way."

"You 'll sile yer purty frock," he jerked out, in a hoarse strained voice, his fallow face flushing as he hobbled along.

"No, indeed! See, I do not let them touch. Do you live about here?"

"Down yonder on th' branch." He nodded his head in the direction of a thin column of smoke, toward which the path at that moment was tending.

"Why, that is grandma's land, is n't it?" He looked up into her face with a sudden intelligence.

"Be you ther new gal over thar, Miss?"

"Yes," laughing merrily. "I am ther new gal. And your name is—"

The laugh was so free and natural it did not disconcert him.

"Jack Durden." He had forgotten his disabilities under the influence of the first womanly sympathy ever expended upon him. "What mout yo' name be?"

"Alice—Alice Worthington."

"Mister Charlie—war he yo' pa?"

"Yes; did you know him?"

"He used ter hunt down ther branch, an' I used ter see him thar. Aunt Tildy ses es how he 's dead."

A shadow fell upon her fair face. She nodded her head and turned her eyes away. The boy felt his mistake in a vague way, but how to remedy it he did not know. He hobbled along by her side, his eyes upon the path, for she had chosen the grass. Presently she too felt his embarrassment, and began to study the uncouth little figure, mastering a natural repugnance to so much uncleanness. This was her first visit to her grandmother's since childhood. The old lady clung to her worn-out plantation of happier days with its dilapidated residence, and managed to make a fair existence out of the "croppers" who rented from her one or two mule-farms, paying cotton in the fall. The elder lady was usually all alone, so far as white associates were concerned, until this orphan, school-days over, elected to divide time with her. One or two old servants remained at "The Hall," and maintained a show of the gentility and style for which the Worthingtons were once famous.

"Can you read, Jack?" she asked presently, to put him at ease again. He was as old as she, but a child in everything but years.

"No, 'm."

"You ought to learn," she said gravely. "A great boy like you should know how to read. You must have plenty of time."

"Ain't got nobody to learn me. Ma don't know how, an' 'sides she 's dead, an' Aunt

Tildy don't know how, an' Unc' Tom he 's wanderin'." The puzzling information about "Unc' Tom" saved Alice from a laugh.

"Wanderin'—how?" He shut his eyes and shook his head.

"Thinks es how he' er preachin' 'holiness,' Aunt Tildy ses." Nothing could have added to the simple outline of his disadvantages unless he had volunteered a confession of mental incapacity. Alice caught his glance, and again the eyes pleased her. Here was pure clay, and she was at heart an artist. Queer ideas floated in her vision for a moment.

"If you could read," she said gravely after a few moments, "you would find it a great pleasure. Don't you understand, *you* can't travel far, you can't go even where the other boys go; but if you could read, your imagination could supply everything."

"What 's 'magination?" She did not stumble as most people do over these grass knots tied by childish tongues.

"Look!" she said, her cheeks glowing with new interest; "yonder is the cloud with the red sunlight on it, and here are cotton-rows passing us on the right, and here are you and I; you see all that, don't you?" He nodded his head, while a bewildered look dwelt upon his face. It was so comical that she gave expression to some of her enthusiasm in a laugh. "Well, that is not imagination; they are facts. Now suppose I say that red streaming cloud over there is a flag, and these lines of cotton-rows that seem to pass us are soldiers, each with a white plume in his hat, and the thunder away back yonder behind us is the echo of the cannon where a battle is being fought, and you are a hero and have been shot and are going to the rear, and I am a woman carrying your knapsack and gun—that is imagination. Don't you understand? You don't have to go to see the battle and the soldiers and the guns; you bring them here with your imagination. If you learn to read, everything you read of you can bring up in just that way."

The boy had watched her face through this explanation delivered with animation. She wondered if he understood. Presently he said:

"Some folks sees ghosts." She nodded her head, well pleased.

"That is it exactly; that is imagination."

His eyes sought the long rows of cotton-plants with new interest, and then the clouds. The far thunder had ceased.

"I reckon the fight 's over," he said suddenly, "an' them thar sojers won't git thar in time."

"Then let 's stop them," she said gaily, lifting the little ax high in the air: "Company, halt!" They stood still and the soldiers ceased to pass, at which they both laughed.

She was a girl full of reforms. As they resumed their walk she said very gently :

"It will take you some time to learn to read, but there is something just as important that you can do at once. Look at your hands and—and—feet. You can keep them clean, and comb your hair." He returned her gaze without embarrassment, but with the old wonder in his eyes.

"What fur?"

"What for! Because you are going to be a man, and every man should keep clean." Jack kept his eyes fixed upon the path, as he hobbled along. He felt but did not understand the rebuke. Presently she added :

"You ought to save your money, too, and buy yourself better clothes; then you could go to Sunday-school." Jack understood that. He shook his head quickly.

"Ain't never had none to save."

"Make some," she said grandly; "raise chickens, make baskets, pick cotton—do something." Her face flushed. "My gracious, if I were a boy, I would do it, cripple or not! If I had health to stand up, and strength enough to carry an ax, I would—would—do something, not lie about here in dirt and rags. I'm afraid you are all lazy. Grandma says 'Lazy people make crooked paths,' and see how this one winds!"

Jack was deep among the problems.

"You make any money?" he inquired. She glanced at him quickly, but there was not any irony in tone or expression. It was accidental.

"Yes—by saving. I made this dress, I trimmed this hat, I tatted this lace."

It would have taken better wits than poor Jack's to contend with Alice's. He looked at her from head to foot.

"It's mighty purty," he said simply; and her smile came back.

They had reached the cabin, a log building in a clearing where the lowlands began. A gaunt, rough-visaged woman in an unclean calico gown and working a snuff-stick between her teeth, came to the door, nodded to Alice, heard her explanation, and watched her curiously as she passed back into the field toward the Hall. Jack dropped the sack inside the door and hobbled off to where a great oak extended its branches. There he lay down at full length and reflected long upon the astounding propositions that had been sown so recklessly in his uncultivated mind. As the shadows began to deepen, he struggled up on his sticks and made his way out to the field's edge. Away across the line of plants he saw a white dress entering the grove at the Hall. When darkness fell he was still there.

"What a pitiful little fellow the Durden boy is," said Alice at tea that evening. Her

grandmother added sugar to her small cup of black coffee with a little thin spoon, older than herself.

"A sorry lot, all of them. Tom Durden has n't done a day's work since the 'holiness' craze seized him. It is a queer idea that you must quit work when sin becomes an impossibility."

"Is that a part of the new creed?"

"I suppose not, but many of them seem to think so."

"Evidently cleanliness is not looked upon as next to godliness among the crackers that I have seen."

"Their cleanliness is generally next to nothing." The old lady was fond of making epigrams.

"The poor little fellow has n't had much chance," said Alice gently. Her mind was still upon Jack.

But, at the Durden's, Jack crawled into the corner where his ragged quilt was spread, and with the soft summer breeze blowing on him through a great crevice among the logs, lay down to resume his thinking. Life all along had been simply a fact with him, and not such a disagreeable fact as might be supposed, for all things are valued by comparison, and no change had ever come to him. Now, for the first time, something was dawning within; the nimbus of a new idea was brightening upon the horizon of his mind. Something had happened that he could not analyze; he saw only the fair-faced girl with her violet eyes and ready white hands. He heard the musical voice and felt the sympathy—human sympathy! He did not know what it was, but it had come to him in its fairest form; and dull, oppressed, hopeless, and enslaved by circumstance though he was, somewhere in the dwarfed and shadowed life a dormant seed had been warmed and was stirring. It drove away sleep. Already things about him were beginning to develop a new relationship. The deep regular breathing of the woman in the same room divorced him from rather than linked him to human companionship, and, sleeping or waking, the man there was nothing to him. He was not lonely because of it, for his thought was there, and the pale far stars seemed to draw nearer and twinkle in friendliness. He fell asleep at last, smiling in the gloom. Past him marched the soldiers with their white plumes, and overhead was the crimson flag. He heard the battle raging beyond the hills; perhaps it was in just such a battle that his father had been killed; and bearing his gun and knapsack as he limped away home was a girl in white. That night, for the first time in his life, the Angel of Hope found the cripple's bed, and smiled upon the face pressed to the crevice in the wall.

II.

JACK DURDEN's mental disturbance continued for several days. At sunset of each he haunted the path over the field, hoping for another meeting with Alice. He hobbled out to the fence where he first met her, and recalled, with the vividness peculiar to childish memories, just how she stood, the expression of her

"No, hit won't," said Jack confidently. Billy did not propose to add mental labor to his other fatigues. He waved his hand good-naturedly toward the white field:

"Dere hit is," he said.

And so Jack Durden became a cotton-picker. He went along slowly from plant to plant, gathering the lint from each and thrusting it into his bag. It was tedious work to any, but trebly

"UNC' BILLY, YER WANT ANYBODY TO HE'P YER PICK?"

face, the tones of her voice, the rose at her throat, and the pea-blooms in her hat. He studied the cotton-rows again with deliberation, and quickened his return across them to see the soldiers rush past, stopping suddenly to see them stop. But she came no more. He betook himself to thought again; and finally a resolution was born.

"Unc' Billy, yer want anybody to he'p yer pick?"

Uncle Bill sat upon his bench before his cabin and surveyed the cripple with mild surprise. He was an old negro who cultivated a two-mule farm on the Worthington lands with a pair of unfed steers. He laughed and leaned his head on his hands; not that the idea of help was new, for Billy always wanted help from some one. Indeed, he would have been glad to surrender the whole job. It was the source of the proposed help that stirred his sense of humor. Who ever heard of Jack Durden wanting work! Billy shook his head.

"Hit ud tek you 'bout er month ter pick er hunderd poun's," he said.

so to him. For want of cultivation Billy's cotton was classed in local terms as "bumble-bee"—that is, cotton so short that the bees could rest on the ground and rob the blooms. This fact called for a lower stoop on the part of the picker, and for one who could not sustain his weight on his legs the occupation was painful. But Jack labored faithfully. When his bag was filled, he had to hobble out and place it in one of Billy's big oak baskets, and return, sometimes to the far end of the row, to resume work.

When the day was ended, and the cotton was weighed upon the Worthington scales, there was forty pounds to Jack's credit, and he held a ticket that called for fifteen cents. An able-bodied hand would have picked two hundred and fifty or three hundred pounds.

Alice attended to the weighing, and praised the boy for his industry.

"Don't forget about cleanliness," she said, smiling and pointing to his begrimed hands and face. She did not know that, becoming fatigued beyond endurance, he had lain down during the afternoon with the blazing sun upon

him, and for hours had dragged himself from plant to plant.

Jack resumed his work the next day, and continued it. But from that time and ever afterward he bathed his hands and face at the branch before going to have his cotton weighed. At the end of the week he was paid ninety-five cents. The pickers scattered to their homes or the village, but the boy lingered. He approached Alice with the money.

"Will hit buy er book ter learn in?" he said. Then she noticed that his pale face was clean, and some effort had been made to straighten out his hair. She was touched by the pathos of the mute response to her admonitions.

"Keep the money," she said. "I have a book I will give you. I have n't any further use for it." She brought him a primer.

"Who is going to teach you?"

Jack scratched his head for a moment.

"Reck'n I kin sorter learn by myself at first," he said. "Hit's easy at ther start, ain't hit?" Alice laughed heartily at the idea.

"No, it is harder at first than at any other time. Come sit down here on the steps and I will give you a lesson."

She explained to him the alphabet, and how words are formed by putting letters together, and then told him the name of the six letters on the first line over and over until he knew them. His quickness pleased the girl, and for the first time she studied closely his face and head. The latter she agreed was of an encouraging shape, and the former it seemed to her was already less dull. The possibility that might exist in that little deformed being rose before her, and a happy thought came with it.

"You are going to learn easily," she said, "and some day you will read anything you please. Don't let your affliction discourage you. Look at Mr. Alexander Stephens; he was sickly and had to be carried about in a chair; and he was n't a bit taller than you—"

"I seen him onct," said the boy, brightening; "he come over hyah to whar some er his folks lives—"

"Did he? Well, that man was a member of Congress from Georgia, and Governor, and Vice-President of the Confederacy, and wrote books."

Jack looked at her blankly. But he knew that all this meant success; and had n't he seen the distinguished statesman riding in a carriage, and all the rich men crowding around to hear him talk, and to shake his hand?

He went home that evening across the field burdened with the most stupendous thought that ever crossed his mind.

Sleep fell upon him that night almost as a faint.

When the next week had ended, Jack had picked one dollar and ten cents' worth of cotton. And more, he knew the alphabet so well that he could repeat it backward as well as forward. All through the days he had run over the names, stopping occasionally to consult his primer; and old Billy, seeing him at it, would shake his head.

"Hit beats me," he said once to Tildy Durden; "reck'n he ain't right in es min'."

"Yer reckon? Well, hit's struck ther boy dif-funt fum es Uncle Tom, an' hit's ter be hoped hit'll keep on er strikin' 'im that er way."

Jack hit upon another plan for improvement. When he was resting himself by assuming a horizontal position in the cotton-row and edging along from plant to plant, he would reach over and trace the letters in the next row, and then read them as he came down again. When he became expert enough to join these in simple words, he would write them also. "Alice" was his favorite. With his whole thought and mind upon the study, he was enabled to advance rapidly.

Alice Worthington watched the conflict with interest, and gave all the assistance in her power. After the first week he left his money in her hands.

"Aunt Tildy'll git hit," he said briefly.

She was indignant. "You don't mean she would spend it?"

The boy grinned, showing his yellow teeth.

"Snuff," he said laconically.

When the picking-season was ended, and Alice returned to Macon, Jack could read in words of one and two syllables.

"Don't make the boy a beggar," said her grandmother; "there are other things to teach him besides reading. Teach him self-reliance." So the girl had taken from his little savings such sums as were needed for his simple books and turned over the remainder to her grandmother. One day Tildy Durden called for it.

"I'd burn it up before you should have it," said the old lady fiercely, "and I'd move you off my land, lock, stock, and barrel. Don't you come here any more." And Tildy did not.

When the train bore Alice away from the station, the last form she saw was Jack's. He stood leaning upon his sticks, his hat in hand. A half-dozen young gentlemen had assembled to see her off, but the smile that lit her face as she leaned from the window of the moving car, and the flutter of her dainty handkerchief, were for Jack. He saw them through his tears. The men mounted their horses and galloped away, but the crippled boy waited until the platform of the last car disappeared around the curve; and then he watched the smoke of the locomotive spurting up over the tops of the far-away pines. Presently the smoke drifted away. He

dragged his helpless limbs over the old path, but the plumes were gone from the broken ranks of the soldiers, and the glory from the scattered clouds. He limped to the rear, carrying neither gun nor knapsack, but a greater load on his heart.

III.

BUT Jack Durden was now a capitalist, and he soon began to give his attention to new fields of labor. He pondered long, if not deeply, upon plans for increasing his sum, and one day he found Mrs. Worthington pruning her roses in the front yard. She was a tall, severe-looking old lady in black silk and lace, but Alice used to say the severity lay only in the iron-gray corkscrew curls that hung across her brow. No one ever saw her dressed otherwise. The silks got old and worn in the creases, and the lace as frail as spider-webs before she died, but with her it was silk, and lace, and corkscrew curls to the end.

She listened kindly to the boy's eager suggestions, and finally gave him a dollar of his money.

"What else, sir!"

Jack had been looking wistfully at the rose-cuttings as they fell from the sharp shears. The curt, abrupt query startled him, but he rallied.

"I was er thinkin' es how, ef yer be goin' ter kill all them flowers, I'd ask yer ter lemme dig 'em up an' take 'em back home."

She laughed silently a moment.

"I'm not killing them, my boy. Cutting them only makes more blooms in the spring. Take the pieces and plant them in a moist place, and you will have all the bushes you want next year." Jack, flushed with delight, gathered as many as he could carry, and then Mrs. Worthington added a few roots of winter pinks and a number of violets.

He began his new venture very cautiously. He was about to turn loose the first silver eagle he had ever held in his hand. It was a solemn moment. He dragged himself all over the neighborhood and finally struck a bargain with an old negress, getting six hens and a rooster for his money. From that time he labored hard upon a chicken-house, his only tool the ax, which he had ground to a good edge at

"JACK HAD BEEN LOOKING WISTFULLY AT THE ROSE-CUTTINGS."

the friendly blacksmith's. He spent a week hunting nails in the village trash-heaps, in the ruins of a burned building and among the shavings about a new one; then he cut pine saplings and shaped them with the ax. With a ladder of his own make he succeeded in getting the rude structure up, and a roof of brush and straw on top. Here he penned his chickens at night, and here he made nests of pine-straw, each with its little canopy of brush. And one day early in January he was made almost frantic with delight by the sight of a white egg in one of them.

In the mean time Jack had not neglected his studies. His books and his chickens absorbed much but not all of his time, and while his eggs and ideas were multiplying, he ran an ingenious fence around the great oak and began his flower-garden. As the spring advanced he found tiny buds upon the stems of his cuttings, and he transferred them to the little inclosure. He knew where pinkroot and arrowroot grew, and he dug them for their bright red flowers; and bear-grass, the *Yucca filamentosa*, that sends up in the fallow fields of Georgia huge shafts seven feet high and hangs out a half hundred white bells. Wild violets grew among the pines, pale-blue, white, and purple velvet; and trillium was there with its pretty star blossoms, and the first bloomer of all, hepatica. These and others, as they made their appearance, he seized

upon and placed in the rich mold of his garden. A dead crab-apple tree full of the dry vines of a morning-glory stood by the roadside, and the pods still held their seed. He gathered half a pint of these and strewed them around his rough fence. A little gourd inside the cabin held his wild peas; he had crawled along in the grass by the path-side the day after he got his rose-cuttings and had found several varieties. Only the keen eye of a woodsman could have discovered them, perfect pods all, but some as small as a needle and only an inch long, ready to fly open from end to end and send their seed in every direction when touched, as he soon discovered. Jack was a rough florist, but nature was kind, and gradually the wreath was forming around the foot of the old oak. One day Pompey came upon him at his labors.

"Hyah sump'n Ole Miss sont," he said, and with a contemptuous sniff was gone. Jack broke the string and drew from the wrapper a dazzling book full of stories and pictures. On the fly-leaf, in a round, firm hand, almost printed, were the words, "From Alice to Jack."

From that moment life took new colors for the boy. He read and re-read the stories until he knew them by heart. There were "Jack and the Beanstalk," "Cinderella," "Red Riding Hood," and all the old childhood favorites. How he treasured the book, how it lay out of sight on the rafter by day when not in use, and under his head by night, the girl, whirling away in society, little dreamed.

But the craze for production was upon him. A number of pigeons daily walked the field near at hand. If chickens, why not pigeons? Some one gave him a scrap of lumber, and he made a rough house for the birds and mounted it upon a pole. With lime thrown aside when a new store in the village was finished he white-washed it; pigeons, he had heard, would seek white houses. And one day a pair walked in and investigated the cote. They must have liked the accommodations, for they took up their abode there. And soon others came.

By this time several hens were off with young chickens, and Jack was full of importance. For several days he disputed with their mothers for the privilege of tending them, but the chicks knew better, and to get the insects and freedom the hens took them down to the branch. Before long he was the proud owner of more than seventy new chickens, and there were plaintive peeks in the dove-cote.

One day old Billy remarked that he had "hear tell up 'bout de Hall dat Miss Allus were 'spected back 'fo' long," whereupon Jack began to give extra attention to his hands, face, and hair.

It was late in the spring then, and at last he saw the old Worthington carriage go leisurely

down to the station, and dragged himself out to the road. There were two young ladies inside when it returned and two of the village beaux. Trembling with excitement, he waved his hat and shouted as it passed, but none heard him except old Pompey, who did not deign to give him a second glance. He only muttered, "Dis po' white trash gittin' pow'ful uppish, an' somebody got ter tek 'em down—holl'in' at folks erlong the road." He cut the off horse to emphasize his disapprobation, and the stately animal acknowledged the attention with a careless whisk of his tail.

Jack went back to his labors very slowly. Days passed. The mental excitement unfitted the boy for study or labor. He haunted the path across the field; he watched the Hall in the distance for a glimpse of her dress. But she came not. A change somewhere had occurred, but he could not fathom it.

For the want of lights the cracker household is in bed shortly after dark, but once again Jack could not sleep, although he lay with his head upon his book and shut his eyes to dream as he was wont. He crept out into the night, and saw the lights at the Hall shining like setting stars.

Obedying a sudden impulse, he took his sticks and went toward them. How still the night was! Not a sound out there except the chirp of the crickets and the far-away hoot of a great owl. But as he neared the house he heard the prelude of a song struck in chords upon a piano, and presently Alice's voice floated out to him. "Nearer, my God, to Thee," these were the words he caught, and, thrilled and touched, he drew nearer to her. There was no fear of detection; Pompey was asleep; and so he lay down just outside the open window at the foot of a tree where the shadow was darkest, and let the sweet melody have its will with his untutored emotions.

Though like a wanderer,
The sun gone down,
Darkness comes over me,
My rest a stone.

Tears rose to his eyes; why, he knew not. They came and fell; a hidden fountain had been opened. They came up from an unblessed babyhood, from a lonely and forsaken youth, from the misery of neglect, from the heart of an infant turned to a man's heart, summoned by the prayer in the voice of the only woman the whole world held for him. Again and again rose the song. He had heard others sing in the church as he passed, and sing at work; he had heard Sunday-school children roaming in the woods near his home practising their carols; but none sang like this one; none put words into his heart that his lips felt like repeating. The lights grew dim within; the breeze upon his brow seemed like a human touch, and

the moisture on his cheeks was stolen away. He slept, lulled to rest for the first time by a woman's song.

When Jack awoke the house was dark, and absolute silence was about him. He remembered, and crept away noiselessly. It must have been well toward morning, he thought, for as he crawled into his quilt and felt for the book, the cock in the pen crowed a reply to a challenge in the far distance.

IV.

THE next morning Jack saw ladies leave the Hall and go into the pines by the road-

ALICE'S WEDDING BOUQUET.

side. An opportunity had come at last. Taking his book, he followed, and presently found them gathering wild flowers. Alice's face lighted up as he approached.

"Here is my protégé," she said to her companion; "and how nice he looks."

Something like a glow swept over his wan cheeks when he heard her words and felt the magic of her touch upon his hand. She too had changed, but it was not all clear to him. She was plumper, and her dress was not white, but a close-fitting dark one, and her hair was done up like a woman's.

Presently he was reading to her rapidly from the story-book. Her companion burst out laughing, and the boy looked from one to the

other, puzzled. Although amazed at his progress, Alice too was forced to smile, for his unassisted mastery of words had resulted in a queer pronunciation. She corrected him carefully, and he adopted the new form.

"Jack Durden certainly amazed me to-day," she said at tea that evening. "He has learned to read English as I read Spanish—with perfect understanding, but without knowledge of pronunciation. One year, and alone! Think of it! Who says mental power is the growth of generations only?"

"It does not follow that Jack's ancestors had no training because his people are as you found them," said her grandmother, reflectively. "Do you remember how Georgia was partly settled?"

"I do not, I am ashamed to say," said Alice, smiling.

"Well, ship-loads of people were sent here from England. Some were from the debtor prisons and the poorhouses; nearly all were very poor laborers, but some were educated, and I am inclined to think these people to some extent were the first crackers. They have degenerated in some respects and improved in others; but their habits of speech show them to be good old English stock. Indeed, I would not be surprised if it should turn out that these people are the purest English on the continent. Jack is not necessarily restricted by mental inaptitude, however he may be by circumstance."

The months drifted away and cotton-picking time was approaching, when one day Alice and her visitor came into Jack's domain. A new surprise was in store for the girl—a new delight. The place was swarming with chickens and pigeons, and an air of prosperity hung over all; but the garden was the crowning glory. All around the morning-glories had covered the rude fence, turning its sides into a tapestry screen embroidered in many delicate tints and designs. On one side they had caught a low-swinging limb of the oak, and, climbing right and left, had made a canopy of blooms, and a cozy retreat from the sun. Here Jack had fixed a seat and was wont to study in the hot part of the day. The beds were a mass of colors, and pea-blossoms and busybodies twined themselves in their annual conflict around the growing rose-plants. A single red rose shone among them—a large double flower of great purity. The girls seated themselves. Alice was in raptures.

"Jack," she said, "I think you have worked wonders. I never in my life have seen such a pretty place. You are an artist and a poet."

The boy was standing straight up, his hands pressed down hard upon his sticks, his hat off. His brain whirled as he heard her words, and

the pallor deepened on his face. Forever, as long as life lasted, would the words ring in his ears. He saw, as in a dream, the two girls sitting there; the pigeons that had dropped down in the walk, one with the light turning to green and gold and bronze as he swelled and whirled about his mate. He heard, away above in the oak's crest, the song of the swinging mocking-bird. A maze of color swept over his vision and he swayed violently. Then it was gone, the one unclouded, happy moment of his life. The seat was vacant.

That summer he dragged himself along the cotton-rows day after day, from dawn until dark, enduring the terrible heat that trembled upon the fields. He was a good whistler, and one day the melody he had heard from her lips came back to him, and he gave it to nature for an hour at a time. He never encountered Alice but once. His tickets, showing the amount due him, were sent in every night to Mrs. Worthington, but some one else than Alice did the weighing. The company at the Hall changed everything. There were gentlemen there almost every day, and sometimes at night there was dancing. He sold his chickens as they came along and sent that money also to Mrs. Worthington. He had no idea how much was due him.

The hawks had caught some of his chickens, and he had come across an old musket in the loft of the cabin, and learned to shoot. He soon became marksman enough to kill a bird, and this opened a new field of pleasure and profit. He learned to lie in the fence-corners and kill doves—sometimes as many as twelve at one shot; and for these he found a ready sale in the town.

So the summer wore away. In the early autumn Alice passed him on horseback at full gallop. Her escort's horse shied violently at the sight of the boy, and she laughed. But she turned her head and smiled back at Jack, and the sting fell out. The next day he learned that she was gone.

Jack passed the fall in hunting. He knew where to find the partridges, and often at sunset he would kill almost an entire covey as they huddled for sleep.

If he could but get some way to ride, he thought, he could sell his game to better advantage, and at last the opportunity came. He found an old mule, turned out to die, half sitting in a field, resisting the last fall, but unable to get up. The owner readily gave him the animal, and two negroes stood him up, for a dime each, and guided the staggering creature to the cabin. There Jack cut grass for him and gave him fodder and water. Under these friendly attentions the mule concluded that perhaps life was, after all, still worth living, and

so took a new lease upon it. Four nondescript wheels from that home of retired wheels, the blacksmith's shed, a day or two of labor with the ax, a marvelous set of home-made harness in which were blended household wearing apparel, boot-legs, and grape-vine,—and Jack forsook pedestrianism. Then the rag craze seized upon him. He put a small fortune into a great tin horn, taller than himself, and entered peddlerdom.

Summer came again, and Alice. He saw her often, for she was fond of riding, and her escorts were plentiful. She often stopped and talked with him upon the road, and she told him once that he was getting to be quite a rich man, that her grandmother held one hundred and twenty-seven dollars in trust for him, and that she was proud of his success. One day a gentleman was with her, and she went over the whole story for him. The gentleman added words of praise, and tossed him a glittering coin as he rode away. Jack picked it up from the rags in his wagon. It was a five-dollar gold piece. That night he dragged himself to the Hall and found Alice.

"Give it back ter 'im," he said doggedly, as though ashamed of his ingratitude. "I ain't no beggar." The girl impulsively placed her hand upon his,—the small white hand, as soft as a pigeon's breast,—and smiled through her wet eyes at him.

"Good Jack," she said, "you have learned *all* the lessons. You are a man indeed."

It seemed to him that the stars never shone so bright as on that night when he crossed the field for home, his withered limbs wet with the dew of the grass as he dragged them along.

"Good Jack," she said, "he whispered, 'an' I'm er man at last.' He took the little story-book from the rafters and kissed it, hugging it in his dreams. He no longer read it. A youth's paper had been coming to him regularly of late, at the post-office, and in his trips on the road he frequently became possessed of other literature. He had traded with a boy for a little harmonica, and learned several airs upon it, one of them, of course, "Nearer, my God, to Thee," and that night, lying with the book under his head, he played softly the well-beloved hymn.

Something awoke him long before day, and he remembered an old resolution to lie in ambush for a hawk that had been very annoying. He knew that the bird was in the habit of alighting on a certain dead pine very early in the morning, and at a favorable moment striking among the pigeons or chickens. Thirty yards away from it was a fence-corner grown up with sassafras sprouts. Taking his musket, he went forth and concealed himself there, and as he lay waiting for the dawn of light he heard

voices on the road. Presently two negroes stopped near him, and their words became intelligible. He gathered distinctly enough that they were planning an attack on the Hall, and his blood ran cold when he realized the danger. No one slept in the house but the two ladies, Pompey, and a mulatto maid. There had never been any trouble in the neighborhood from housebreakers, but a few days previous several convicts from a gang at work upon the public roads had escaped, and they were desperate men.

While these thoughts were whirling in the boy's mind the men moved on. He knew that they would follow the road around; he struck out with all his might straight across the field. On he toiled, stumbling and falling headlong in his frantic efforts to hurry, bewailing his helplessness, and panting for breath. The minutes seemed hours, but he reached the yard at last. Then came screams out into the night, piercing him like knives. He was too late! He dragged himself to the house side, upon the old carpenter's bench, into the open window—how, he never knew. He found himself in the great hall, blinded by lights. He saw Alice and old Mrs. Worthington in their white gowns bravely facing the burglar, who, with his uplifted ax, was threatening the screaming servant-girl, and dropping to the floor, he fired. The man plunged headlong into the corner with his arm shattered, and the next instant the other rushed from an adjoining room he had been plundering, to escape. Jack half raised himself and swung the gun in the air—then came a blow, and darkness.

Pompey came rushing in at last, and others later. They secured the half-dead burglar and carried the senseless boy into Alice's room and placed him upon her bed. For a while they thought him dead, but he recovered. The uplifted gun had partly checked the terrible blow aimed at his head, and had saved his life.

But wounds were nothing, for was it not Alice's hand that washed away the blood and the pain?

"Sing it again," he said softly. They had given him an opiate and his lids were heavy.

"What, Jack?"

"'Nearer, my God, to Thee.' I laid outside one night—don't yer know, 'bout ther wanderer, an' the sun gone down—"

Then she sang it again, and when she had ended the boy slept.

v.

THE fame of Jack's defense brought him many friends and customers. He was proud and happy as never before. And not only Alice, but one day old Mrs. Worthington stepped down from the old carriage at the cabin and in-

spected his possessions while they praised him to his aunt. They sent him books. Such books! They opened the whole world to him.

But Jack went on with his rag business; he met Alice oftenest on the road. The sound of his horn was heard all over the counties round about as his business circle extended. Often he came back from his trips late at night, and as he passed the Worthingtons' he always sounded a call upon the horn. People who heard the clear, mellow notes said:

"That is Jack Durden. He is blowing to let his folks know he is coming home."

At the Hall the gaieties crowded upon each other. There, in the other world of people, the boy had received the nickname of "Alice's hero."

In the course of his travels a strange thing had happened to Jack. There came into his possession a circular from some Western establishment that claimed to cure all deformities. He found in it a picture of a boy with limbs all distorted, like his, and then a picture of the same boy restored. His heart gave one great throb and seemed to have ceased beating. But the next moment it resumed work with rapidity and sledge-hammer violence. A defined hope was born that instant, and with hope came dreams.

Months passed. Jack the ragman drew all his money from Mrs. Worthington's hands, and she was glad of it. There was three hundred dollars, and she always had been a little nervous after the burglary.

Then he disappeared. People who thought at all on the subject concluded that he had only gone on a little longer trip. The truth is, he had left his tumbledown outfit at a distant railway-station and gone West.

The blow to his hope of a cure came with crushing force. With more than usual frankness the officials at the curative establishment told him that his case was hopeless. He found his way back to his wagon and thence journeyed home. Not a note was sounded upon his horn; no tune issued from the little harmonica. In the rags sold him by one of the Worthington negroes was a scrap of a cambric handkerchief bearing in raised letters the initials "A. W." This he took from his pocket and placed upon the seat by his side. It was his only companion homeward.

He reached the cabin just after dark, and, commenting on the number of lights at the hall, drew from his aunt the remark:

"Weddin', they tells me."

"Who?" She did not see his sudden pallor.

"Miss Allus an' er feller from up erbout Augusty. Don't reccullec' his entitlements." That was all. Jack went out and dropped down under the tree in his little garden. The clouds

were black above him and there were moans in the forest. There he lay, dumb and suffering.

"Good Jack," she had said, "you have learned *all* your lessons well." Perhaps the words came back to him again.

That night, when the wedding-dance was at its best, one of the revelers found old Pompey standing in the back doorway holding a great bouquet of flowers in his hand and quarreling. He took them from the negro into the great hall and read aloud from a strip of paper attached, "From Jack to Alice." A shout of laughter went up from all the others, but Alice took the flowers in both little hands and buried her lips in them for an instant. At that moment the white face of a boy disappeared from the window into the darkness that rested on the fields. And the dance went on.

Jack Durden did not pause until he reached the middle of the field. The storm burst upon him there. He stood with his slight form drawn up, and gazed about him under the pressure of a sudden memory. The lightning was incessant. It seemed as though waves of flame rolled across the long lines of plants, and the instantaneous thunder made the ground tremble. The roaring winds bent and twisted the cotton-plants, tearing out the white plumes and tossing them madly everywhere. The summer hail struck him like so many shot. The air was full of groans and sighing.

"It's the battle," he said, and the blinding lightning uncovered the smile upon his white face lifted toward the clouds.

TEN years showed many changes. Old Mrs. Worthington, in her faded silk and spider lace,

was placed under the little clump of cedars where so many of those whose name she bore had preceded her. Tom Durden went into the "far land" also, where, at least, his creed of holiness obtains; and Tildy crossed the half-century line in company with a husband, much to her final regret. The little garden at the foot of the oak disappeared, and with it the chicken- and pigeon-houses and the tumble-down rag-wagon.

But the old plantation had fallen to Alice and her husband, and during the summer evenings the lights at the Hall still shone like setting stars across the field.

One day the academy bell up-town rang every freckled youngster into place, and a little golden-haired girl came in shyly and stood by the teacher. He was a slender, well-dressed young man, whose pale, restful face suggested the hard student. By his chair as he sat stood a pair of crutches. A smile shone from lips and eyes as he placed his hand under the chin of the new-comer—the gentle, assuring smile that drew all children to him.

"And this is Alice," he said very softly and slowly; "so it is, so it is." He looked up to where, standing in the door, a fair young matron was regarding him with moist eyes.

"I shall want her to begin here," he said, taking from his drawer a little half worn-out primer and opening it. "I will teach her the six letters on the first row."

That day, for him, there was a glory in the school-room brighter than the sunlight.

The battle was over.

Harry Stillwell Edwards.

SONNET ON THE SONNET.

SUNLIT and broad the king's highway of song
Lies yonder—but I tread it not, more fain
To linger dreaming in this pleasant lane
Where oft, when weary seemed yon road and long,
Fame's pilgrims rested. Oh, what memories throng
This little, narrow space! What love, what pain,
These hedges know of! What high hopes, what vain
Desires, have here found utterance sweet or strong!
Here Shakspeare hung his verse Orlando-wise
On many a branch; here Dante sang of love;
Sad Milton here forgot the evil days;
And still 't is echoing with Laura's praise—
This lane, so strait, so small?—But, ah! above
What depth and vastness of the boundless skies!

Inigo Deane.

INTERLUDES.

FIREFLIES.

SEE where at intervals the firefly's spark
Glimmers, and melts into the fragrant dark ;
Gilds a leaf's edge one happy instant, then
Leaves darkness all a mystery again !

A PARABLE.

ONE went East, and one went West
Across the wild sea-foam,
And both were on the self-same quest.
Now one there was who cared for naught,
So stayed at home :
Yet of the three 't was only he
Who reached the goal—by him unsought.

ART.

“LET art be all in all,” one time I said,
And straightway stirred the hypercritic gall :
I said not, “ Let technique be all in all,”
But art—a wider meaning. Worthless, dead—
The shell without its pearl, the corpse of things—
Mere words are, till the spirit lend them wings.
The poet who breathes no soul into his lute
Falls short of art : 't were better he were mute.

The workmanship wherewith the gold is wrought
Adds yet a richness to the richest gold :
Who lacks the art to shape his thought, I hold,
Were little poorer if he lacked the thought.
The statue's slumber were unbroken still
Within the marble, had the hand no skill.
Disparage not the magic touch that gives
The formless thought the grace whereby it lives !

TRANSFORMATION.

THROUGH a chance fissure of the churchyard wall
 A sweet-breathed vine thrusts out a vagrant spray,
 At whose slim end a snow-white blossom droops
 Full to the dewy redness of a rose
 That reaches up on tiptoe for the kiss.
 Not them the wren disturbs, nor the blue bee
 That buzzes homeward with his load of sweets:
 And thus they linger, flowery lip to lip,
 Heedless of all, in rapturous mute embrace.
 Some necromancy here! These two, I think,
 Were once unhappy lovers upon earth.

DEATH DEFIED.

THERE dwells one bright Immortal on the earth,
 Not known of all men. They who know her not
 Go hence forgotten from the House of Life,
 Sons of oblivion.

To her once came
 That awful Shape which all men hold in dread,
 And she with steadfast eyes regarded him,
 With heavenly eyes half sorrowful, and then
 Smiled, and passed by. *And who art thou,* he cried,
That lookest on me and art not appalled,
That seem'st so fragile, yet defiest Death?
Not thus do mortals face me! What art thou?

But she no answer made: silent she stood;
 Awhile in holy meditation stood,
 And then moved on thro' the enamoured air,
 Silent, with luminous uplifted brows—
 Time's sister, Daughter of Eternity,
 Death's deathless enemy, whom men name Love.

Thomas Bailey Aldrich.

TOPICS OF THE TIME.

The Progressive Discovery of America.

THIS number of THE CENTURY goes to its readers on the first day of the "Columbus year." It is a year which THE CENTURY will commemorate in many ways, one way being a series of articles describing and illustrating the remarkable architectural beauties of the Columbian Exposition at Chicago next year. It is the object of that exposition to celebrate, in a manner worthy of our position and power as a nation, the discovery of this country by Columbus four hundred years ago. Delay in reaching a decision as to a site made necessary a postponement till 1893, but a celebration in that year will be scarcely less appropriate than it would have been in 1892. In fact, it would be appropriate in any year between 1892 and 1898, for discoveries were made almost continuously by Columbus and other navigators between 1492 and 1498, and it was not till the latter year that he set foot upon the soil of the continent of America.

In his first voyage, which began on August 3, 1492, and ended on October 12, Columbus discovered only the Bahama Islands, landing first upon one of them which its Indian inhabitants called Guanahani. For a long time the weight of authority was in favor of San Salvador as being the one which most nearly meets the confusing descriptions which Columbus himself wrote of his landing-place, but the "weight of modern testimony," says Justin Winsor in his latest work, "Christopher Columbus," "seems to favor Watling's Island." Columbus visited several other islands, including Cuba, during this first voyage, discovering among other things that the Indians of Fernandina lived in houses shaped like tents, "with nets extended between the posts, which they called *hamacs*,—a name soon adopted by sailors for swinging beds." The rude cut which Winsor gives of these *hamacs* shows them to be in construction and shape the exact counterpart of the netted hammocks of to-day.

The second voyage of Columbus began on September 25, 1493, and the first land sighted was one of the Caribbee Islands, which he reached on November 3. He landed and named it Dominica. He passed on, discovering other islands in this group, reaching the islands discovered on his first voyage on November 22. He spent a great deal of time in searching for gold, especially for one marvelously rich mine which the Indians always told him was somewhere not far in advance of where he was. He became so eager in the search for this mine that the Indians soon learned to hold up a nugget of gold and exclaim: "Behold the Christians' God!" It was while in the Bahamas on this second voyage that Columbus wrote to his sovereigns in Spain proposing a slave trade in the savages of the New World. He remained in the Bahamas till March 10, 1496, exploring the greater part of the time and discovering additional islands, including Jamaica.

Columbus began his third voyage on May 30, 1498,

and on July 31 he discovered and named Trinidad, landing upon that island and giving it its name because of its triple-peaked mountain which reminded him of the Trinity. He looked across the channel which separates Trinidad from the low country of the South American continent about the mouths of the Orinoco, and supposed the coast which he saw stretching away for twenty leagues to be that of another island. On his two former voyages he had insisted that Cuba was a continent, and not an island. And now when he was for the first time in sight of a continent he supposed it to be an island. He tasted the water which washed the shores of Trinidad, and, though greatly surprised to find it fresh, he did not dream that it was made so by the waters of a mighty river which drained a continent. The precise date on which Columbus first set foot on the continent is not known, but it is believed to have been August 5, 1498. The precise spot is also uncertain, but it is known to have been on the shores of the Gulf of Paria, near some of the many mouths of the Orinoco. After sailing along the coast for several days, he returned to the colony he had founded at Hispaniola, now Hayti, in the Bahamas, remaining there till October, 1500, when he was sent back to Spain a prisoner in irons.

On his fourth voyage, which began May 9 or 11, 1502, Columbus discovered the island of Martinique, and sailed across the Caribbean Sea to the coast of Honduras, landing near the cape of Honduras on August 17. He then sailed along the coast of Costa Rica and the Isthmus of Panama, till December 2, when he turned backward and set sail for Hispaniola. On November 7, 1504, he returned for the last time to Spain, and his discoveries were at an end.

He had discovered the continents of Central and South America, but had not set foot or eye on the continent of North America. He died in ignorance of the fact that he had discovered a new world, adhering to the last to his theory that the lands and countries he had found belonged to that part of Eastern Asia which the ancients called India.

A year before Columbus discovered the South American continent John Cabot discovered the island of Newfoundland, and sailing through the strait of Belle Isle coasted along the shores of the North American continent. It was held for many years that he sailed as far south as Florida, but this is now considered to be very doubtful. At all events, it is conceded that in June, 1497, he saw some portion of the North American continent, but he, like Columbus, had no idea that he had found a new world, merely supposing the land he saw to be an extended peninsula of Europe, infolding the North Atlantic.

Americus Vesputius is claimed to have discovered the continent of South America in 1497, while Columbus was making ready for his third voyage, and this claim has long vexed historians, who are still divided in opinion about it, though the weight of opinion is

against it. But while Columbus was bending all his mental energies to making his discoveries harmonize with his theory that the lands he had found belonged to India or Eastern Asia, Vesputius published a clear and graphic description of the new lands he or Columbus had found, giving to them for the first time the name of *Mundus Novus*, New World. This name suited so well the glowing descriptions which Vesputius wrote, that it took a powerful hold upon the popular imagination, with the result of investing Vesputius with all the honors of discovery and giving his name to the New World he had pictured in such graphic colors.

Alabama's Thousand-Dollar-a-Day Blunder.

ALABAMA'S experience with banking "in the interests of the people" was in some respects similar to that of Michigan with "Wild-cat" banks, described in the November CENTURY. Like that of many other States at about the same period, it resulted in complete collapse, with great financial loss to the people whom it was designed to benefit, a serious impairment of the State's credit, a flood of public scandal, and a heavy burden of debt. The history of Alabama's blunder is so full of instruction for those who believe in State or national agency for making everybody prosperous by means of liberal banking and cheap money, that we shall set it forth in some detail.

Alabama went into the banking business as a State in 1823, when its legislature passed an act for the establishment of the Bank of the State of Alabama, the capital, which was not limited to any amount, to be furnished entirely by the State. The management of the bank was intrusted to a president and twelve directors, who were to be chosen annually by joint vote of the legislature. The only limit put to the volume of notes which the bank should issue was that they should be in such sums as the president and directors might deem "most expedient and safe." Certain public funds were set aside to constitute part of the capital of the bank, and in addition the State was authorized to issue State stock to the amount of \$100,000, redeemable within ten years, and bearing interest not exceeding 6 per cent. The bank began business in 1825. Three years later it was authorized to issue \$100,000 more of State stock, redeemable in twenty years, at a rate of interest not exceeding 6 per cent. In the same year other public funds, aggregating \$1,300,000, were added to the capital. Five years later about \$500,000 of State University funds were transferred to the bank as capital. Between 1832 and 1835 four branches of the State Bank were established in as many cities, and State bonds to the amount of \$6,300,000 were issued to supply them with capital.

The design of the founders of the system was to distribute the bank money as evenly as possible among the people of the State, and with this end in view the original act stipulated that the money loaned by the bank should be apportioned among the several counties of the State according to their representation in the legislature. At first no limit appears to have been placed to the amounts of a bank's money which its president and directors could themselves borrow. The result was that they borrowed as much as they wished and loaned it to their friends on such security as seemed satisfactory to themselves.

The choice of president and directors by the legislature, designed to give the people control of the bank's management, led to gross corruption and abuse, being aided greatly in these directions by the requirement for equal distribution of loans throughout the State and by the lack of any limit upon the sums which the president and directors could borrow. When the several branches had been established, each with its president and directors, there were annually to be chosen by the legislature between sixty and seventy directors. In their campaigns for election to the legislature, candidates would point to the requirement for the equal distribution of loans among the people, and promise each one of their supporters a loan in case of election. Before members who had been elected after such pledges, the candidates for bank directors had to go for election. Mr. J. H. Fitts, of Tuscaloosa,—to whose valuable paper upon the history of the State bank and its branches, read by him before the Alabama Bankers' Association in June, 1891, we are indebted for most of the information in this article,—says the number of candidates for directors was usually two or three times as great as the number of places to be filled, adding: "For, it must be remembered, the office of bank director, without salary or any emolument whatever, was regarded by many as the most lucrative office in the State. The legislature was annually beset by a horde of greedy adventurers, who were candidates for bank directors, and who resorted to all kinds of electioneering tricks and promises to secure their election. Unfortunately for the banks, the votes of too many members of the legislature were controlled by the liberality of candidates in promising bank discounts to them and their friends." Mr. J. W. Garrett, in his "Reminiscences of Public Men in Alabama," gives an amusing incident illustrating this abuse. A member of one branch of the legislature died while a campaign for the election of bank directors was in progress, and all his fellow members wore the usual badge of crape on the arm for thirty days. A shrewd countryman from a remote county, who was on a visit to the State capital, noticing that all the men with crape were the recipients of "treats" of all kinds, including cigars and suppers galore, put a similar badge upon his own arm and had a royal good time for several days before the imposture was discovered.

Mr. Fitts relates that one of the hotel-keepers of Tuscaloosa succeeded in getting himself elected a bank director in 1832. "The increased patronage of his hotel was wonderful; many members of the legislature and a great majority of the persons who visited Tuscaloosa to borrow money stopped at his hotel with the view of securing the influence of the proprietor with the Board of Directors, which passed upon all applications for money." Four other hotel-keepers in the same city, realizing that there was no other way in which to compete with such attractions, became candidates, and in 1834 they were all elected. On one occasion, when the five hotel-keepers constituted a majority of the Board of Directors, and had discounted a great many notes and bills, each note or bill receiving the ardent advocacy of one of the hotel-keepers and the votes of all five, a note was passed around which received nobody's support, and was about to be rejected, when the president, who was not in sympathy with the majority, remarked quietly of the signer of the note: "This man must have camped out last night."

Of course, members of the legislature had great influence on the directors. "No director," says Mr. Fitts, "could expect the vote of a member whose bill he refused to discount. This made it an easy matter for members of the legislature to borrow money for themselves and their friends. The directors were even afraid to refuse to discount paper which was recommended by a member of the legislature."

There could be only one outcome of such a state of affairs. The State bank had, in 1826, a capital of \$253,646 and a circulation of \$273,507. In 1837 the capital of the State bank and its branches had reached \$7,889,886, and the circulation \$4,576,752. The notes discounted and bills purchased in 1826 amounted to \$448,859; in 1837 they amounted to \$17,693,983. A commission which had been appointed, because of alleged bank frauds, to investigate the character of these notes and discounts estimated that over six millions of the \$17,693,983 were worthless. This made the liabilities of the banks nearly seven millions greater than their assets, and made it plain that something heroic must be done to prevent immediate collapse. Only a year before, the people believed themselves to be enjoying boundless prosperity. They had such faith in the money of their banks that the legislature, on January 9, 1836, passed an act "abolishing direct taxation in the State," and setting aside \$100,000 of the bank money to defray the expenses of the State government. That was a practical application of the contention that if a State can create money then there is no need of taxation. The people of Alabama in this respect carried the cheap-money idea to its logical conclusion. They made the test when they were in the midst of what are known as the "flush times of Alabama." Everybody had little difficulty in getting some money into his pocket. Yet scarcely had the test begun when a panic swept over the State, and it was discovered suddenly that something was the matter with the financial and business situation. The legislature was summoned in special session to devise means of relief. The demand from all quarters was for more money for the people, and it was decided by the legislature to heed it, by authorizing the State to loan the people \$5,000,000 more through the banks. This was in June. In December following, a further loan of \$2,500,000 was made. These extreme measures only postponed the inevitable collapse, while adding greatly to its disastrous consequences. In 1842 the charters of the branch banks were repealed, and in 1845 that of the State bank expired by limitation.

When the results came to be summed up, it was discovered that the University and other funds, aggregating several millions of dollars, had been lost, and that the State had sunk with them many millions more. Mr. Fitts placed the total loss to the State, principal and interest, up to June, 1891, at over \$31,000,000, and estimated the amount of interest which the taxpayers are called upon annually to pay on account of the lost funds and outstanding bonds at over \$271,000 a year. In a recent speech which Governor Jones, of Alabama, made in Camden County, he placed the total amount of taxation for these objects at \$362,000 a year, or nearly \$1000 a day. This gives us a concrete example of the cost of cheap-money experiments which is of great value. Governor Jones used it very forcibly as a warning to his people against the insidious teachings of the advocates of the subtreas-

ury scheme, for the latter plan in many respects resembles it. As Mr. Fitts well says, the Alabama experience "demonstrates the folly of a government attempting to carry on a banking business with public funds managed or controlled by its politicians."

Mississippi's Crop-Moving Currency.

MISSISSIPPI'S experience with cheap money, during the period of inflation and speculation which followed the removal by President Jackson of the public deposits from the United States Bank, and the refusal to recharter that bank, was more reckless than that of Alabama, and consequently more disastrous. It began in 1833 and ended in 1840. For five or six years the people of Mississippi believed themselves to be the richest and most prosperous on the face of the globe. Everybody had all the money he wanted, and if he needed more the banks would pour it out for him. Yet when the end came everybody discovered that he was so poor that the State arose as one man, and repudiated its most solemn obligations, thus adding breach of faith to its other follies. In this respect its conduct was in most unfavorable contrast with that of Alabama, though the disasters both suffered had been brought on by similar causes.

"Nowhere," says Professor William G. Sumner in his "History of American Currency," in commenting upon the developments of this period, "had the paper-money mania raged worse than in Mississippi, where the banks operated as cotton factors, manufacturing money to carry cotton as they needed it." The experiment began in 1833 when the State came to the aid of the Planters' Bank of Mississippi, which had been chartered three years before, by issuing \$2,000,000 worth of bonds, at six per cent. interest, to be used as the bank's capital. The avowed object was to enable the bank to "aid in developing the resources of the State." The bonds sold at a premium, and the bank had a remarkable prosperity during the following year. This was so encouraging that nine new banks were chartered in 1834, and many others in following years. In 1838 the State, desiring to get a larger share in the general prosperity brought on by such liberal banking, chartered a bank of its own, called the "Union Bank of Mississippi," and issued \$5,000,000 worth of bonds at five per cent., most of which were sold in Holland at their par value, bringing into the State the largest sum of money its people had ever dreamed of possessing. The whole State went wild with a fever of speculation. The smaller banks did their best to rival the Union Bank, and all vied with one another in pouring out currency, making loans and discounts, and publishing fabulous accounts of their great prosperity.

At the close of 1839 the twenty-six banks in the State professed to have a paid-up capital of over \$30,000,000, loans and discounts exceeding \$48,000,000, a note circulation exceeding \$15,000,000, and deposits aggregating nearly \$9,000,000. As the free white population of the State at that time was only 170,000, the alleged paid-up capital per head equaled \$180, loans and discounts \$285, and the circulation, including deposits, \$140. Here, surely, was the largest *per capita* circulation ever known, larger by \$40 than what our wildest cheap-money advocates demand now, yet what was the result?

At the moment of greatest apparent prosperity, when everybody believed himself rich and hourly growing richer, the entire system collapsed. It was then discovered that all of the boasted \$30,000,000 of paid-up capital, with the exception of the money that had been borrowed on the bonds of the State, consisted of "stock notes" which had been paid in for capital, the banks discounting them and the proceeds going to pay for stock subscriptions. This was simply an exchange of one form of credit for another. Absolutely no money had gone into the banks except that obtained by the sale of State bonds, and when that was exhausted nothing remained but entries upon the bank records for indebtedness from which nothing was ever to be realized.

In summing up the result, Mr. Henry V. Poor, from whose "Money, its Laws and History" we have obtained much of our information, says:

The \$48,000,000 of loans were never paid; the \$23,000,000 of notes and deposits never redeemed. The whole system fell a huge and shapeless wreck, leaving the people of the State very much as they came into the world. Their condition at the time beggars description. Society was broken up from its very foundations. Everybody was in debt without any possible means of payment. Lands became worthless for the reason that no one had any money to pay for them. The only personal property left was slaves, to save which such numbers of people fled with them from the State that the common return upon legal processes was in the very abbreviated form of "G. T. T., gone to Texas, a State which in this way received a mighty accession to her population.

The State paid the interest on the bonds issued for the banks for less than a year, when the governor informed the bondholders that the State, "in her sovereign capacity, had refused payment of her bonds." This position the legislature sustained in 1842 by adopting a report of a committee declaring payment of the bonds to be "incompatible with the honor and dignity of the State." The State's conduct was defended on the floor of Congress by Jacob Thompson, afterward President Buchanan's Secretary of the Interior. The bondholders had the question of the constitutionality of the bonds brought before the highest court in the State, and obtained a decision in their favor, the court affirming their constitutionality and declaring them to be binding obligations upon the State; but as no execution could issue against the State, the bondholders could obtain none of their lost money. As late as 1853 some of the bondholders, by persistent efforts, obtained from the legislature an act referring the question of payment to the people. The people voted that the bonds should not be paid, thus adding the final and overwhelming touch to the State's disgrace.

Surely there cannot be found in the long and almost inexhaustible calendar of cheap-money experiments a more striking moral lesson than this Mississippi history affords, for a system which destroys not only the material prosperity of a people, but its moral sense as well, is one that should be shunned like a pestilence.

Attacks upon Public Parks.

THE fight to prevent the injury and impairment of public parks, large and small, appears to be a perpetual one. There is always springing up some new person or persons possessed with a craving, as absorbing as it is mysterious, to get into a park of some kind and do harm to it in one way or another. If the park be a

small one in a great city, the hostile attack takes the form of a request to run a railway across or over a corner of it, or to be granted a section for a railway station or some other semi-public use. Plausible reasons are always advanced in support of such propositions, the chief of which usually is that the public convenience will be greatly enhanced by the incursion. A few years ago it was proposed with much seriousness to run an elevated railway across the Central Park, and it was claimed that the structure might be of such architectural beauty as to constitute an additional charm for the park. Again it was proposed to construct along the entire length of one side of the same park a speeding-track for horses which should be devoted to fast driving by the owners of blooded horses. In Boston and other cities the proposition is made anew every year to allow the city parks to be used as training- and parade-grounds for the militia.

The attacks upon the great parks, those of the Adirondacks, the Yosemite, the Yellowstone, differ only in degree. Somebody wishes to run a railway into or through them, or to construct a highway across them, or to use portions of them for some kind of private enterprise of a profitable nature. The mere sight of so much property lying idle appears to be irritating to the utilitarian spirit of the age. Men wish to get at it and make it earn something for them. And the first excuse that they make is that their particular project will be a great public convenience. If it be a railway that they propose, they say it will not injure the park, but bring its beauties and delights within easy reach of thousands of people who otherwise would never be able to enjoy them. If they wish to cut down trees, they say they only desire to do so in order to improve the views, to "open vistas" from hotels and thus increase the enjoyment of visitors. "Opening vistas" has long been the favorite device of park desolators all the way from New York city to the Yosemite Valley, and is one of the most extreme and violent forms of park vandalism ever invented.

All these attacks are open to the same objection, which is unanswerable, that they remove, in part if not entirely, the very qualities which are essential in a park. The prime essential of a park in a great city is that the noise and turmoil of the streets cease at its gates, and that within is quiet, an opportunity to enjoy nature in its cultivated aspect, and a certain freedom of action within limits which are prescribed only for the greatest good of the greatest number. Every respectably behaving person has as much freedom there as if he were in his own grounds. All is as free to him as it is to every one else. A railway across or over such a park, or a use of any part of it for a semi-public purpose, destroys both its quiet and its democratic equality, and its main charm has been taken away.

In the case of a great park like the Adirondack, or the Yellowstone, or the Yosemite, the essential quality is that of a solitude, a wilderness, a place of undisturbed communion with nature in all her primitive beauty, simplicity, and grandeur. For such a solitude vast domain and practically complete separation from the developments of civilization are indispensable. Run a railway into such a place, and it ceases at once to be a wilderness. Nature flees, never to be brought back again. With her go the wild game which attracted the huntsmen and made camp life,

with all its restfulness and strength-giving qualities, possible.

A few years ago the Adirondacks were a wilderness throughout almost their entire extent. To gain access to some of their most charming solitudes, it was necessary to ride forty or fifty miles by stages, an entire day being necessary to "get into the woods" after the railway journey had ended. In those days fish and deer and other game were plenty, and a camper could pass weeks and months without encountering more than a few casual signs of civilization. Then came the railways; two of them were allowed to penetrate the wilderness so far that a journey by rail could be made to points within an hour or two of the parts hitherto most inaccessible. What had been a wilderness became instantly a "summer resort." Cheap hotels and boarding-houses sprang up everywhere, and the woods were literally filled with visitors from all quarters. The whistle of the locomotives drove the deer into the deepest recesses of the forests, and the hordes of visitors, who had neither a genuine love of sport nor a respect for game laws, soon cleared the streams of fish. Now it is proposed to run a railway across and through the Adirondack region, opening up a large portion of it to settlement. This attack has been defeated temporarily, but it has not been abandoned. If it shall succeed ultimately, the Adirondack wilderness will soon be a thing of the past.

For a long time the Yellowstone Park was threatened with a similar destruction, but the commendable action of the President, under authority of the last Congress, seems to have removed it for all time. Repeated attempts were made so to increase the size of the park as to have it include the watershed of all the streams which flow into the Yellowstone Lake, but legislation with this end in view was for a long time prevented by a railway lobby, in the interest of a road across one portion of the park, an invasion which would be made impossible by the proposed addition. On the last day of the session, however, Congress passed an act authorizing the President to declare that the additional territory desired had been "withdrawn from entry" and should remain the property of the nation. He has so declared, and the danger of destruction by means of railways is safely and permanently passed. Congress ought next to provide the park with a superintendent, at a salary which would make it possible to obtain the best expert talent for the purpose.

The condition of affairs in the Yosemite Valley during the past year has been such as to confirm the fears of lovers of that wonderland as to its future, and to show that the temperate warnings sounded in this magazine two years ago were not without solid basis of fact. To judge from the reports of credible and disinterested observers, the actual destruction of scenery has been, to a certain extent, curbed by the force of public criticism. Miles of fence,—the existence of which was denied,—have been taken down, and injurious schemes which were mooted in official quarters have apparently been abandoned. Yet there is nothing to show that the Commission has in any way changed its attitude toward the main criticism of its policy—the failure to intrust the supervision of improvements affecting the scenery to experts of proved capacity. On the contrary, moderate, respectful, and understated criticisms of the policy of these public servants have

been met officially by abusive personalities and by a sweeping denial of evident facts, while at the same time the Commission was engaged in a so-called "improvement" of Mirror Lake, which, it is said, has resulted in depriving it of much of its exquisite sylvan beauty. The issue is clearly joined—whether or not the Yosemite shall be intrusted to hands of adequate skill and taste. In the face of the Commission's announced intention to cut down all the underbrush and trees of thirty years' growth in the valley, it would be superfluous to discuss what has already been done in the way of destructiveness. Part of it was highly objectionable in itself; part of it as symptomatic of a bad state of affairs in the Board of Control. We are far from saying, and have never said, that no trees should be cut in the valley, but we do maintain that the present Commission has demonstrated its incompetence to decide upon these and other important details of this character.

Above and beyond the question of the landscape management of the valley lies another question—whether or not the Commission, which is the agent of the State as the trustee for the nation, has at any time lent its countenance to the building up in the Yosemite Valley of a financial monopoly, sustaining itself by obnoxious means. With the single desire that the valley shall be properly managed, we have reluctantly come to the conclusion that the surest, if not the only, way to preserve this reservation for the highest public uses is to bring about its recession to the General Government, and thus to merge it into the management of the greater National Park which now surrounds it.

Meantime, the thanks of all good citizens, and especially of all lovers of nature, are due to Secretary Noble for the wise, firm, and energetic manner in which he has conducted the affairs of the Yosemite National Park. While there may be honest differences of opinion as to the policy of military control, the protests against it of certain interests which have lived by preying upon the public domain are the strongest proof of the beneficent action of Congress in establishing this safeguard for the new reservation. To change somewhat the line of its boundaries by excluding some unparkable property which constitutes a fraction of it, would seem to be wise; but this is a detail which the friends of the National Park will be the first to wish properly adjusted. The first year of Secretary Noble's management of the park shows not only its value in the preservation of the sources of water-supply, which will be more evident from year to year, but the great use to the public domain of excluding predatory sheepmen and lumbermen, whose complaints are conclusive evidence of the need of this reservation. Californians owe it to themselves and to their State, as well as to the nation, in whose interest they have undertaken to administer this trust, to see that the sordid interests of a few private parties connected with the operation of the valley are no longer permitted to impair its attractiveness or to stand in the way of its adequate conduct by the best talent that can be secured. It is idle to disguise the fact that in order to do this the better sentiment of California must make itself more vigorously felt. Naturally all the influence which can be exerted by those who have "something to make" out of the valley will be put forth during the present Congress to oppose a better state of affairs and to obtain a modi-

fication of the public policy of preserving the forests for the larger uses of the people.

We misjudge the State of California if her citizens will sit idly by and see the sources, in part, of her greatness turned over to the tender mercies of private individuals. The preservation of her scenery, the conservation of her forests, and, most of all, the security of the water-supply of her valleys, ought to move the press and the people of the Golden State to prompt and vigorous protest against the flagrant and long-continued disregard of her interests.

"Progress of Ballot Reform,"¹ Colorado.

COLORADO should be included in the list of States which have passed new ballot laws. It enacted an excellent law in 1891, and, like Michigan, incorporated in it a corrupt-practices act which forbids the improper use of money in elections and requires sworn publication after election, by both candidates and campaign committees, of all money received and expenditures made.

¹See "Topics of the Time," in this magazine for September, 1891.

OPEN LETTERS.

M. Gounod and his Ideals.

IN a private letter to a friend last summer the composer of "Faust" announced that the end of his creative career was come; susceptibility to heart-disease would prevent him hereafter undertaking any work of magnitude. M. Gounod is now an old man and much broken in health. He spent last summer in Versailles, but, I believe, returned to Paris in time to witness a performance of "Lohengrin" at the Grand Opera, and give expression to his admiration for the genius of Richard Wagner. Of late years his life has flowed along as peacefully as a meadow brook, and its conclusion bids fair to have the tender grace of a dying day of our Indian summer. It is a well-rounded life which in its decline is modulating into the key of its early years. In his old age M. Gounod recurs to the ideals of his youth and sets an example for the things that are lovely and of good repute in morals and art.

The critical historian of the future will look for the explanation of the "Faust" score in the German models which the composer chose early in his career. They were Mozart, Von Weber, and Wagner. For Mendelssohn, too, he had much love, and, indeed, the two men were not unlike in their gentleness of character and its lyrical expression. Sympathy for Mendelssohn's ideals turned his thoughts toward the oratorio nearly half a century ago, and found expression, mild but unmistakable, in his "Redemption," with its revival of the use of the *chorale*. The gospel of dramatic expression Gounod read in the scores of "Don Giovanni," "Der Freischütz," and "Lohengrin." Like Verdi, he knew the score of "Don Giovanni" by heart already as a conservatory pupil; but, unlike Verdi, he never became satiated with it. Young Verdi respected but did not love Mozart's masterpiece. Young Gounod's admiration for it was a passion which remained perennial and only a short time ago bore its loveliest fruit in a glowing eulogy and analysis of the work, printed for the benefit of the young composers of France. "The score of 'Don Juan,'" writes the composer of "Faust," "has influenced my whole life like a revelation; for me it always was and has remained the embodiment of dramatic impeccability." That such an admirer of Mozart should appreciate Von Weber at his true value and have an open heart for the newer evangel of Wagner is not at all surprising; that he did not follow Wagner to the logical outcome of his theories was due to the essentially lyrical trend of his genius. Gounod is an

eclectic musician, and therefore, in the nature of the case, he could not be a revolutionary force in French art; but his "Faust" worked a greater change in the manner of operatic composition in France than all the reformatory harangues of Berlioz.

In his youth Gounod's nature had a strong religious leaning. Even after he had won the Prix de Rome and was living as a *pensionnaire* of the Institute in the Villa Medici, his love for music had to struggle for supremacy with an ardent desire to enter the priesthood. The painter Ingres in Rome drew a portrait of the dreamy youth in monk's dress. His first compositions were ecclesiastical. A letter from Fanny Hensel, written in 1843, says that the young Frenchman, who was much liked in the Mendelssohn household, was then engaged on an oratorio entitled "Judith." What became of that work I do not know, but the old predilection for the oratorio form returned when M. Gounod came to complete the edifice of his works. "The Redemption" and "Mors et Vita" are its expression. The same tendency may be found in his choice of operatic subjects. "Polyeucte" tells a story of Christian martyrdom, and when Dr. Hanslick, of Vienna, visited M. Gounod twelve or fourteen years ago, he found him engrossed in the sketches for an opera to be called "Abelard and Heloise," which, the composer explained, was not to celebrate the passion of the famous lovers so much as it was to symbolize the struggle between enlightened conviction and petrified dogma. The work was put aside, but the fact of its conception remains to speak of the blending of fancifulness and earnestness, liberality and devoutness, in Gounod's religious nature.

H. E. Krehbiel.

The Camp Morton Controversy.

I.—COMMENTS ON DR. WYETH'S REJOINER.

I DO not care to make any extended reply to the rejoinder by J. A. Wyeth to my article in the September number of THE CENTURY, concerning the charges contained in an article entitled "Cold Cheer in Camp Morton" in the April number of THE CENTURY.

This controversy has reduced itself to a question of veracity between certain ex-Confederate prisoners of war and ex-Union officers of the highest standing and respectability who have enjoyed the confidence and respect of the communities in which they have lived for a long series of years, and they are sustained in

many cases by the records of the War Department and other official data. They also have the indorsement of a committee of seven of the most distinguished officers that served in the Union army from Indiana, viz., General Lew. Wallace, General M. D. Manson, General John Coburn, General James R. Carnahan, Major Charles L. Holstein, Major James L. Mitchell, and Captain E. H. Williams, who were appointed, in pursuance of a resolution at the last annual State encampment of the Grand Army of the Republic, held in this city in April last, to investigate the charges in Dr. Wyeth's article, as well as the indorsement of Colonel I. N. Walker, the department commander of said organization. Some of these officers enjoy a national reputation, and all are well and favorably known outside the State of Indiana.

There is scarcely a statement in the evidence produced by Mr. Wyeth that could not have been suggested by his first article, and, like that, the later article is singularly deficient in names and dates. Among his witnesses there are but two of whom I ever heard or have any knowledge, viz., P. M. Gapen of this city and Dr. W. P. Parr of Emporia, Kansas, both of whom were known as Southern sympathizers during the war, and whose testimony I propose to impeach.

He quotes P. M. Gapen of this city as saying that the firm of P. M. Gapen and Co., grocers, purchased during the early winter of 1864 a large quantity of coffee, sugar, rice, etc., through persons now deceased, which he afterward learned was from, or was intended for, prisoners at Camp Morton. Upon such testimony Mr. Wyeth attempts to prove that the rations intended for the prisoners were stolen and not issued. Neither the name of P. M. Gapen nor P. M. Gapen and Co., grocers, appears in the Indianapolis City Directory or Marion County tax duplicate for 1864. If he bought these goods at the prices named, did he not suspect that those from whom he bought them had wrongfully come by them? And when he was so informed, did he inform the Government, and if not, why not?

Dr. William P. Parr was a contract surgeon who served at Camp Morton from February 12, 1864, to February 5, 1865. W. W. H. McCurdy, a well-known and reputable citizen of this city, says:

I was in the employ of the United States Government at Indianapolis in 1864, during which time I became acquainted with Dr. Parr. In the spring of 1865 I opened a law office in this city. Dr. Parr was an almost daily visitor to the same, and the condition and treatment of Confederate prisoners was a subject of frequent conversation between us, and I distinctly remember that he always spoke of the abundance and excellence of the supplies, of the splendid physical condition and the kind treatment they received, all of which I, of my own personal knowledge, knew to be true. Had the doctor been cognizant of such a state of things as his statement in the September CENTURY would indicate, I am certain he would in some of our conversations have alluded to the matter.

George W. Smith of Lebanon, Indiana, was intimately acquainted with Dr. Parr, visited him in Camp Morton, and often talked with him as well as the prisoners, most of whom said they would rather be there than in the field, as they had better treatment than if they were in their own hospitals, had plenty to eat, and had roofs to sleep under. He says: "I have often heard Dr. Parr, during the time he was in the service, and since, while we were neighbors at Lebanon, Indiana, say that the rebel prisoners were better treated than the soldiers

who guarded them." I was very much surprised to see his statement in the September CENTURY, as it does not correspond with what he has always told me.

Captain James H. Rice of Hartford, Connecticut, who was provost-marshal at Camp Morton every sixth day during the time Dr. Parr was on duty there, says he was familiar with the barracks, as he inspected them, and that he knew Dr. Parr and never heard a complaint from him.

Elijah Hedges, undertaker, says:

I have read the testimony of Dr. Parr in the September CENTURY, in which he says a great many of the frozen dead bodies were carried from the bunks to the dead-house. I removed all of the dead bodies from Camp Morton, and I solemnly assert that there never was a frozen body taken from the dead-house, and I never heard of any one being frozen in the camp until I read Mr. Wyeth's article. If any one ever had been frozen in that camp, I am sure I should have heard of it.

General A. A. Stevens, commander of Camp Morton, while recently looking through some old letters from ex-prisoners of war who were confined at Camp Morton, found the following, which will speak for itself:

CHAMBERSBURG, PENNSYLVANIA, November 11, 1864. COLONEL A. A. STEVENS. DEAR SIR: I have felt very anxious about my nephew, John Wyeth, who was sick when I last heard from him. You have granted me so many favors respecting this dear misguided boy that I take the liberty of asking you if he is sick, to let me know of it, and anything he needs, if you will supply it, I will, with many thanks, repay you. . . . Respectfully yours, LOUISA W. DOUGLASS.

Mr. Wyeth and all of his witnesses speak in the highest terms of the management of the hospital at Camp Morton, and are highly complimentary in their references to the surgeon in charge of the same. In the next breath they charge that large numbers of persons were frozen to death in camp. This statement is disproved by the records and statements of the physicians in charge of the camp, which could not have happened unless the facts had been suppressed and records falsified by the very surgeons they compliment so highly. Such a policy, if adopted, would have been known, and would have been resented, not only by the community as a whole, but by the numerous rebel sympathizers that partially composed it. The men in charge of the prison were humane, and the intimation that the prisoners in their care were deliberately starved, beaten, and murdered is grotesque to the point of absurdity.

A grievance uncomplained of for six years, says a leading newspaper in commenting on Wyeth's article, is for the most part held to be no grievance at law. A grievance uncomplained of for nearly thirty years has no claim to attention in a court of conscience.

W. R. Holloway.

II. CONCLUSION BY DR. WYETH.

SINCE writing my article in the April CENTURY, I have been furnished with an article on Camp Morton written by the Rev. J. G. Wilson and printed in "Scott's Monthly Magazine" (Atlanta, Georgia) in 1868. Dr. Wilson was president of the Huntsville (Alabama) Female College, 1865-72; transferred to a Kentucky church and president of the Military Academy at Bowling Green, 1872-76; thence to St. Louis in charge of the St. John's Methodist Episcopal Church, where he died in 1884, honored and loved by all. This article by

this educated and Christian gentleman, written while the experiences of his prison life were fresh in his memory, coincides in nearly every essential particular with mine. He says the prisoners "suffered the pangs of hunger almost constantly" (p. 297). "Men who when captured were stalwart, fleshy men would dwindle away to skeletons." "Prisoners in the extremity of their hunger were often seen rooting like so many hogs in the piles of garbage from the hospital cook-room" (p. 299). The charges of cruelty and shooting of prisoners are also fully corroborated, but I cannot ask THE CENTURY to give space for a duplication of my statements that already have been strongly sustained.

John A. Wyeth.

Will H. Low.
